THE SOCIETY FOR THE DIFFUSION OF
USEFUL KNOWLEDGE.

C O P

COPYRIGHT, or, as it was formerly termed, copy, has been defined by Lord Mansfield, 'to signify an incorporeal right to the sole printing and publishing of somewhat intellectual, communicated by letters.' By this 'somewhat intellectual' is to be understood something proceeding from the mind of the person by whom, or through whom, such a right is claimable. Yet, although mere republications of the compositions of others are no subject for copyright, it is by no means limited to such productions as contain new or original ideas. Thus translations both from ancient and modern languages, notes and additions to existing works, even mere compilations and abridgements, are similarly protected. As to these last however it is often a question for courts and juries to decide, whether the compiler or abridger really intended to present the original matter in a more useful or agreeable form, expended his own labour upon it, and so entitled himself to protection, or whether he only sought, under false pretences, to defraud the author or his assigns of a portion of their lawful profits. This decision depends of necessity on the circumstances of each particular case. Further, a right of copy attaches to the authors of ideas expressed by other symbols as well as letters, to musical composers for example.

The origin of copyright must be sought in the general conviction which has always prevailed of its justice and expediency. 'When a man,' says Blackstone, 'by the exertions of his rational powers has produced an original work, he seems to have clearly a right to dispose of that identical work as he pleases; and any attempt to vary the disposition he has made of it, appears to be an invasion of the right. Now the identity of a literary composition consists entirely in the sentiment and the language. The same conceptions, clothed in the same words, must necessarily be the same composition; and whatever method be taken of exhibiting that composition to the eye or ear of another, by recital, by writing, or by printing in any number of copies, or at any period of time, it is always the identical work of the author which is so exhibited, and no other man, it hath been thought, can have a right to exhibit it, especially for profit, without the author's consent.'

Accordingly it has been supposed that a common-law right of copy existed in England previously to any statute on the subject. As a legal proposition however this cannot be supported by the proper and direct proof of a fair judicial decision before the passing of the first statute relating to it in the reign of Queen Anne; inasmuch as it never appears to have been directly controverted up to that time. But, in the absence of positive authority, it may be fairly inferred, from the old charters of the Stationers' Company, and much more from their registers, whence it appears that some thousands of books, even as early as the times of Elizabeth, passed from one owner to another by descent, sale, and conveyance; from acts and ordinances of parliament which necessarily imply a recognition of it by the nature of their provisions respecting printing; and from decrees of the Star-chamber, which, though not binding precedents, are

C O P

evidence of the opinion of many learned men as to the then state of the law. It is further to be noted, that the non-existence of express decisions on the point is accounted for down to 1640 by the necessity of obtaining a license prior to the printing of anything, so that authors had no occasion to apply to civil tribunals for protection, as none but themselves and those claiming under them were so licensed, and he who printed a book without this was subject to enormous penalties.

It has hardly been controverted in the various arguments that exist upon this common-law right of copy that literary compositions in their original state, and the incorporeal right of the publication of them, are the private and exclusive property of the author. The question made has been that this property was put an end to by publication: and yet without publication it is useless to the owner, because it is without profit, and property without the power of use or disposal is not property. In that state it is lost to society as a means of improvement, as well as to the author as a means of gain. Publication is therefore the necessary act and only means to render such a property useful to the public and profitable to the owner. If, says Lord Mansfield, the copy which belonged to the author before publication does not belong to him after, where is the common law to be found which says there is such a property before. All the metaphysical subtleties from the nature of the thing may be equally objected to the property before. It is equally detached from the manuscript or any physical existence whatsoever. There is in fact nothing in the act of publication to vary the nature of the right, so that that which is necessary to make a work useful and profitable should be taken as destructive at once of an author's confessed original property against his expressed will. It has accordingly been the almost unanimous opinion of the high authorities who were called on to decide the point, that by the common law of England authors were entitled to copyright, and as there was nothing in statute or custom to determine it, or distinguish this from other species of property, that such right was once perpetual. The arguments for the contrary opinion are collected in the judgment of Mr. Justice Yates in the case of *Millan v. Taylor*, 4th Burrow, p. 2354.

From the above premises arose the question, after the passing of the first statute respecting literary property in 1710, whether by certain of its provisions this perpetual copyright at common law was extinguished for the future. After some less important decisions in the negative on motion in the Court of Chancery and elsewhere, the question was solemnly argued before the Court of King's Bench, during the term, when Lord Mansfield presided, in 1769. The result was a decision in favour of the common-law right as unaltered by the statute, with the disapproval however of Mr. Justice Yates. Subsequently, in 1774, the same point was brought under the consideration of the House of Lords, and the decision of the court below reversed by a majority of six judges in eleven, as Lord Mansfield, who adhered to the opinion of the minority, declined to inter-

ferre ; it being very unusual, from motives of delicacy, for a peer to support his own judgment on appeal to the House of Lords. It is somewhat remarkable, that although this could be hardly termed a decision, as the judges were in point of fact divided equally, it has since been held so important as a precedent and sustained in so many subsequent cases, that it must now be considered as settled law that perpetual copyright is put an end to by the statutes.

The two universities were not slow to protect themselves from the consequences of this decree in the case of Donaldsons and Beckett, and obtained from Parliament, in 1775, the following year, an act for enabling the two universities in England, the four universities in Scotland, and the several colleges of Eton, Westminster, and Winchester, to hold in perpetuity their copyright in books given or bequeathed to the said universities and colleges for the advancement of useful learning and other purposes of education. This protection, sanctioned by penalty and forfeiture, so long as such books are printed at the presses of the universities and colleges respectively, is still enjoyed, unaffected by the general statutes on the subject ; and a similar protection is extended to the university of Dublin by 41 Geo. III., c. 107.

The chief provisions of the 8 Anne, c. 19, entitled 'An act for the encouragement of learning, by vesting the copies of printed books in the authors or purchasers of such copies during the times therein mentioned,' as regards the effecting of that purpose, were, that the authors of books already printed, and those claiming under the author, should have the sole right and liberty of printing them for a term of 21 years and no longer ; and that the authors of books to be printed, and their assigns, should have the same right for 14 years and no longer. And the last clause of the statute directed that after the expiration of these 14 years the same right should return to the authors, if living, for another 14 years. The persons infringing these provisions were to be punished by forfeiture of the pirated book to the proprietor, and a penalty of one penny for each sheet, one-half to go to the crown and the other half to the informer, provided always the title to the copy of the book had been duly entered with the Stationers' Company.

The 41 Geo. III., c. 107, which extended the same law to Ireland, gave a further protection to authors and their assigns by action for damages and double costs, and raised the penalty per sheet to three pence, to be divided in the same way.

The 54 Geo. III., c. 156, by which literary property is at present mainly regulated, is entitled 'An act to amend the several acts for the encouragement of learning by securing the copies and copyright of printed books to the authors of such books and their assigns.' By the fourth section of the act, after reciting the statutes of 8 Anne and 41 Geo. III., by which authors and their assigns had the sole liberty of printing for 14 years and no longer, and after reciting that it will afford encouragement to literature if the duration of copyright were further extended ; it is enacted, that after the passing of this act, the author of any book, and his assigns, shall have the sole liberty of printing and reprinting such book for the full term of 28 years from the day of publication, and, if the author shall be living at the end of that period, for the residue of his natural life.

With regard to books at that time already published, it is enacted that if the authors then living should die before the expiration of fourteen years from publication, their representatives should have the benefit of the second fourteen years ; and if the authors should survive till twenty-eight years from publication, themselves should have the benefit for the remainder of their lives. But the rights of all assigns are saved in both cases.

The penalties for the infringement of copyrights are the same as in the former statutes, but with the limitation that all legal proceedings under the act must be commenced within one year.

The results to be collected from the statute, and from subsequent decisions upon it, as far as protection to the rights of authors is involved, may be briefly stated thus, as a summary of the existing law.

1. The published works of any author deceased before the 29th July, 1814, are wholly unaffected, and at this time public property. 2. The published works of any author at that period living, but who died within fourteen years from the time of first publication, go after his death to benefit his assigns, if he has assigned his interest therein,

for the remainder of that fourteen years ; but in all cases, whether he has or has not assigned, to his personal representatives for another fourteen years. They afterwards become public property. 3. The published works of any author at that period living, but who dies more than fourteen, and less than twenty-eight years from the date of publication, go to his assignees if he has assigned, and to his personal representatives if he has not, for the residue of the twenty-eight years. They afterwards become public property, as they are at his death if he survive twenty-eight years. 4. The published works of any author at that period living, more than twenty-eight years having then elapsed since publication, are unaffected by the act, and continue, as they were before, public property. Such is the law with regard to works published before the passing of the 54 Geo. III., c. 156 ; with regard to works published since it is as follows :—

1. If an author does not assign his interest in the work, and lives more than twenty-eight years after publication, the copyright remains his for life, and after his death becomes public property. 2. If the author does assign his interest, the copyright attaches to his assigns for his life ; and if he die within twenty-eight years, it attaches to them for the remainder of that term. It afterwards becomes public property. 3. If the author does not assign his interest, and dies within twenty-eight years from publication, the copyright attaches to his personal representatives for the remainder of that term. It then becomes public property.

It has been said that the exclusive property of authors in their manuscripts has always been recognized by the law. But this principle extending only to prevent the printing or circulating copies of them without the license of the owner, it was found necessary to pass recently a statute for the peculiar protection of the authors of dramatic compositions. This is the 3 Will. IV., c. 15, entitled 'An Act to amend the Laws relating to Dramatic Literary Property,' which, after reciting the 54 Geo. III. c. 156, provides that the author of any dramatic piece, not hitherto printed or published by authority of him or his assigns, shall have as his property the sole liberty of representing it, or causing it to be represented, at any place of dramatic entertainment ; and the author or assignees of any such work, printed and published within ten years before the date of the act, shall have the same privilege for twenty-eight years from publication, and for the remainder of the author's life, if he longer live. The penalty for violating these enactments is to be enforced by action for damages, with double costs, to be brought within twelve months from the commission of the offence.

There are certain works excepted from the benefit of the law of copyright from the nature of their contents. Such are, all publications injurious to public morality, inimical to Christianity, or stimulating, either as libellous or seditious, to a breach of the peace. This must however be understood of their general tenor, and not of isolated passages. As far as a rule on the subject can be laid down, it is, that any work containing matter for which a public indictment or private prosecution could be sustained is not protected by the law, but may be pirated by other parties at pleasure, who, if sued for penalties under the act, are allowed to give in evidence the nature of the composition which they have published, in order to defeat the action. This is a remarkable exception to the general rule of law, that none shall take advantage of his own wrong ; and its operation is quite as remarkable, the effect of the rule having often been to disseminate more widely that which the law has declared not to merit protection.

The protection given to authors by the statute of copyright is coupled with conditions of some particularity, although it is by express words in the fifth section exempted from depending on them. Besides the registry at Stationers' Hall, which is to be made within one month for books published within the bills of mortality, and within three months for all others, at a penalty of five pounds, and eleven times the price of the book, the 54 Geo. III., c. 156, requires that eleven copies of every work shall be delivered on demand in writing within twelve months for the use of the British Museum, Sion College, London, the Bodleian Library at Oxford, the Public Library at Cambridge, the Library of Advocates at Edinburgh, the libraries of the four Scotch universities, and the libraries of Trinity College and the King's Inns, Dublin. It has been decided, and the decision is most important, as affecting many works of the greatest value and expense, that works published in parts

or numbers are not liable to this tax until completed. 2 Younge and Jervis, 166; 4 Bing. 540. Farther, by a very recent statute, 6 and 7 W. IV., c. 110, the 54 Geo. III., c. 156, is repealed, so far as relates to the delivery of copies of books to the four universities of Scotland, Sion College, and the King's Inns, Dublin, compensation being given to those institutions upon an estimate of the annual value of books supplied upon an average of three years, ending the 30th of June, 1836.

Besides the special copyrights of the universities secured to them as before mentioned by statute, there still exist certain prerogative copyrights attaching to the owners in perpetuity. Of these the chief belong to the king, which were more numerous and considerable formerly than at present. Many are now quite obsolete, such as those of almanacs, law-books, and Latin grammars; and others very questionable, such as that of the exclusive right to print the English translation of the Bible. The king has a prerogative copyright in the liturgy and other services of the church, in proclamations, orders in council, and other state papers, and in the statutes. It has been decided, that the University of Cambridge shares by letters patent in the king's prerogative of printing acts of parliament. The House of Lords also exercises an exclusive privilege, somewhat fallen into disuse, of publishing its own proceedings as the supreme court of judicature.

The usual modes of legal proceeding to prevent or punish the infringement of copyright, or as it is more usually termed, piracy, are by action for damages, or for the penalties given by the statute; or more commonly still, by obtaining an injunction in equity to prohibit the unlawful publication, which affords immediate and summary redress. This is always granted where the legal title of the plaintiff to the work is made out, and the identity of the pirated publication with his own shown to the satisfaction of the court. The proof even of an equitable title has been held sufficient to qualify him for this remedy. *Mawman v. Tegg*, 2 Russ. 385. Neither will the court be restrained from granting the injunction, by proof that the matter pirated forms only a part of the publication complained of, and that what is original will be rendered useless to the defendant and the public by prohibiting its sale. But as this mode of proceeding presses very severely upon defendants, and often inflicts irreparable injury, the court, where any doubt attaches, will either refuse the injunction altogether, or grant it only on condition of the plaintiff's bringing an action immediately, to have the merits of the case decided by a jury with the smallest possible delay.

These legal protections are for the most part found effectual in restraint of domestic piracy. But over the frequent and daily-increasing practice of foreign piracy, by reprinting English works abroad, they exercise no useful control, although the 54 George III., c. 156, expressly includes within its prohibitions the importers of foreign editions, and the sellers of them with a knowledge of their origin. Notwithstanding this, most popular productions of English authors are immediately reprinted in France and Germany, and are to be obtained in England at little more than their original cost. A practice so destructive of the fair profits of mental labour can only be effectually redressed by prevailing on foreign countries to extend the benefit of their own laws against literary piracy to alien as well as native authors. With respect to America, a memorial has recently (1836) been transmitted from this country to Congress, praying for some law to protect English copyright in the United States. Many English works are reprinted in America; and the reprints may be, and frequently are, with a little contrivance sold in England at lower prices than the original publication. In this instance the English author loses in another way: his English edition, which would sell in America, is supplanted there by an American reprint, which costs the publisher only paper and printing. The American author suffers in the same way in England. Some arrangement therefore between these two countries for the extension of copyright would often make a book twice as valuable to the author, and would of course be for the benefit of the reader, as it might be published at a lower price.

A notice of the law of copyright would be incomplete which did not advert to some other compositions which receive from statute a protection analogous to that of literature. Such are engravings, etchings, and prints, maps and charts, and sculpture of all kinds. These resemble written works

as regards the incorporeal right in them accruing to the author by the exertion of his mental powers in their production, but differ as they also require a good deal of his manual skill and labour, and are therefore his property upon the same general principles as any other manufacture. Such productions therefore are even more plainly entitled to the protection of the law than books.

The chief statutes affecting the copyright in works of design, engraving, and etching, are the 8 George II., c. 13, which vests it in the inventor, designer, and proprietor, for fourteen years from the first publication, and enforces this provision against any person pirating the same by forfeiture of the plate and prints, and a fine of five shillings for each print, to be recovered by action within three months of the discovery of the offence. The 7 George III., c. 38, extends the term of copyright to twenty-eight years; and in addition to the subjects of the former statute includes maps, charts, and plans, under the same conditions. It also extends the time of bringing an action for the penalties to six months. The 17 George III., c. 57, gives the owner of the copyright a further remedy of action for damages and double costs within the same limits of time.

With regard to models, casts, and other sculptures, the 38 George III., c. 71 vests the right and property in these for fourteen years in the proprietor, and gives him a special action on the case against the offender, if brought within six months. These provisions were rendered more effectual by 54 George III., c. 56, by which double costs were given, and an additional term of fourteen years superadded in case the maker should be living at the end of the first term.

As to sculpture certainly, but more doubtfully as to prints, for there have been conflicting decisions on the point, the work must bear upon it the name of the maker and the date of publication to entitle it to the protection of the law.

The right of patents also presents many legal features analogous to those of copyright, but this subject requires a separate notice. [PATENT.]

COQUIMBO. [CHILE.]

COQUIMBO, a town of Chile, and the capital of the province of Coquimbo, about seven miles from the bay of Coquimbo, was founded in 1544 by Don Pedro Valdivia, who called it La Serena, by which name it is still sometimes known. It is a poor town, with a population which has been estimated at 10,000 souls; but other estimates reduce it to 4000. The streets are all at right angles to each other, of moderate width, but very dirty; the houses, which are generally of one story, have small gardens attached to them, owing to which circumstance the town occupies a much greater surface than the population would lead one to expect. It contains six or seven churches and a public hospital. The Puerto, or port, is nothing more than a collection of about a dozen miserable huts, with a custom-house, situated at the head of a small indentation of the coast open to the northward. No fresh water can be procured, and supplies of all kinds are scarce and dear. There are no foreign importations direct to Coquimbo: supplies are obtained from Santiago or Valparaiso. From 500,000 to 550,000 dollars are annually exported to Europe in British men-of-war, besides gold; but the duty on this article being very heavy, it is always smuggled on board, and consequently no estimate of the quantity shipped can be formed. The port is in 29° 57' S. lat., 71° 17' W. long., about 200 miles north of Valparaiso.

The district abounds in mines of gold, silver, copper, and iron: the iron is not worked, on account of the scarcity of fuel.

COR CA'ROLI, a name given by Halley to the star of the third (or 2½) magnitude in Canes Venatici, in memory of Charles I. It is situated on the neck of the lower dog, and, when figured, has a heart surmounted by a crown. The name is not much in use among astronomers.

COR LEO'NIS. [REGULUS.]

CORA'CINA, a genus separated from the crows by Vieillot, and divided by him into four sections. The first comprises those species which have the bill furnished at its base with velvety feathers (*Les Col-nus*, naked necks); the second those whose nostrils are covered with setaceous feathers, directed forwards, and whose upper mandible is notched towards the end (*Les Choucaris*, Graucalus); the third those whose bill is naked at the base, and notched at the point (*Coracina gymnocephala*, Vieill., *Corvus calvus*, Latham, for example); and the fourth, that curious species on which Geoffroy St. Hilaire founded his genus *Cephalopterus*.

Cuvier, in the last edition of the 'Règne Animal,' defines *Graucalus* to be the Greek name of an ash-coloured bird (*oiseau cendré*), and says that three *Choucaris* out of four are of that colour. M. Vieillot, he adds, confounds these birds with his *Coracinae*, which comprise the *Gymnoderi* and the *Gymnocephali*.

M. Lesson, who places the group under the *Ampelidæ*, observes that the genus *Coracina* is far from being determined. Thus, he observes, M. Vieillot places under it the *Cephalopterus* of M. Geoffroy-Saint-Hilaire, the *Choucari*, and the *Col-nu*, or *Gymnoderus*. (He might have added the *Gymnocephalus* of Geoffroy and Cuvier.) Temminck adds to it many of the *Cotingas* of Le Vaillant; but for his own (Lesson's) part, he adopts the term *Coracina* for that group of birds which Cuvier has collected together under the name of *Piauhaus*.

Genera. *Coracina*, Lesson. (*Coracina*, Temminck; *Les Piauhaus*, (*Cotinga*) Cuvier; *Piauhau*, Querula, Vieillot.)

Bill depressed, smooth, ciliated at the base, thick, narrowed at the point, angular above, a little curved towards the end, slightly toothed at the point; lower mandible a little flattened below; head and neck feathered, but without any ornamental plumes, and without any naked skin.

Example. *Coracina scutata*, Temm. *Coracias scutata*, Lath.

This species differs but little from *Coracina rubricollis*, *Muscicapa rubricollis* of Gmelin, in the colour of its plumage; but the wings are shorter. In *C. rubricollis* the plumage is all black, with the exception of the throat and front of the neck, which are of a purpléd rose-colour. In *C. scutata* the red, which covers the throat and breast, goes as low as the upper part of the belly, and the bill is not black, as it is in *C. rubricollis*. Locality, Brazil, which is also the habitat of *C. rubricollis*.

[*Coracina scutata*.]

Gymnocephalus. (*Coracina*, Vieillot.)

M. Lesson observes that MM. Vieillot and Temminck place the *Gymnocephali* (Bald-heads) among the *Coracinae*, and that Cuvier contents himself with observing that *Corvus calvus*, Latham, the type of this new genus, has the bill of the Tyrants, with the ridge (culmen) a little more arched, and a great portion of the face denuded of feathers. Le Vaillant, he states, regarded this denudation of the skin in the front of the head as the result of a particular habit, and in the 'History of the Birds of Paradise' has printed a note, in which he affirms that he had received from Cayenne a specimen, having this part well covered with feathers; but, M. Lesson adds, that he himself had seen at Rochefort more than twenty skins of *Gymnocephali*, and that all had the face bare of feathers. However it may be, he continues, this genus entirely requires revision.

Example. *Gymnocephalus calvus*, *Coracina gymnocephala*, Vieill., *Corvus calvus*, Lath., *Capuchin Bald-Head*. Size of the crow, and of the colour of Spanish snuff,

or, as some authors write it, Capuchin colour, whence the Creoles of Cayenne give it the name of 'Oiseau mon père.' The quills and the tail-feathers are black. The large beak and ample forehead bare of feathers give a singular air to this bird. Vieillot observes that it has been compared to the rook, on account of the nakedness of the head, a comparison which seems to him just; 'for,' says Vieillot, 'it has not this part naked till it is adult, the young, like the young rook, having the head entirely feathered, and even the nostrils covered with small setaceous feathers, as I can testify, from the inspection of a young individual, of which I have made mention in the first edition of the *Nouveau Dictionnaire d'Histoire Naturelle*.' Locality, Guiana.

[*Gymnocephalus calvus*.]

Gymnoderus. (*Coracina*, Vieill., Temm. *Cotinga*, Le Vaill.)

The principal characters of *Gymnoderus*, Geoffroy-Saint-Hilaire, rest on the possession of a bill like that of the *Coracinae* and *Cephalopteri*, with a partially naked neck and a head covered with velvety feathers.

Example. *Gymnoderus foetidus*, *Coracina gymnodera*, Vieill., *Corvus nudus*, Lath., *Gracula nudicollis*, Shaw., *Gracula foetida*, Linn., *Col-nu*, Buff. Rather larger than the jackdaw, but the body is thick and fleshy. The sides of the neck are entirely naked, and only present some traces of down. Buffon's figure, on the contrary (Planches

[*Gymnoderus foetidus*, male.]

enlum. 609), represents this part as being clothed with a considerably thick down. Upper part of the head, back of the neck and throat, covered with small close-set feathers like black velvet. External edges of the quills of the middle of the wing, the last quills, and all the wing coverts, bluish grey. Great quills and tail-feathers black, with bluish reflections. The rest of the plumage, bill, and feet, black. Eyes red brown, with a yellow skin beneath. The female is smaller, and of a brownish black. Locality, Brazil and Guiana.

Cephalopterus.

Bill strong, robust, mandibles nearly equal, the upper one convex and scarcely curved at the summit, not notched at the point; lower mandible flattened below. Nostrils longitudinal, open, hollowed into an oval excavation; bristles at the border of the bill, which infringe a little on the frontal feathers. Two rows of feathers, taking their origin on the forehead, and elevating themselves into a plume or crest on the head. The feathers of the neck form a kind of pendant pelerine in front of the neck, which is naked.

Example. *Cephalopterus ornatus*, *Coracina cephaloptera*, Vieill. Colour a uniform blue black. Head and base of the bill ornamented with a plume or crest, forming a sort of parasol, composed of straight elevated feathers, with white and stiff shafts, and terminated by an ear (épi) of black beards, which projects forwards (se renverse en devant). The sides of the neck are naked, but long feathers forming a loose pelerine, and hanging down lower than the breast, spring from beneath the throat and from the sides of the neck. Tail long, slightly rounded. General plumage of a deep black. Crest and feathers of the pelerine giving metallic reflections (Lesson).

The bird that furnished the description was brought to M. Geoffroy-Saint-Hilaire from Lisbon. M. Lesson states that the belief was that it came from Brazil, but that a well-informed Portuguese had told him that it was from Goa. M. Vieillot says that the colour of the naked skin of the neck is cerulean blue. Mr. Swainson, in his 'Natural History and Classification of Birds,' London, 1836, says, 'The crest of this extraordinary bird is immensely large, advancing so far in front as to touch the end of the bill, and it is compressed in the same manner as that of *Rupicola*; but the ends of the feathers, instead of meeting so as to form a sharp ridge, suddenly recede from each other, curve outwards, and form a most elegant drooping line of plumes, hanging over on the sides, so as to shade the face like an umbrella. The figures that have hitherto been given of this rare bird are all taken from the specimen in the Paris Museum, and which has been sadly distorted in the setting up. A minute examination of this specimen has convinced us that the frontal feathers, instead of being raised over the

[*Cephalopterus ornatus*.]

bill, as Temminck represents them, partly repose and overshadow it, at least as much as do those of *Calyptromena* and *Rupicola* (vol. i. p. 41). The species above noticed is the only one known.

CORAL. [POLYPARIA CORTICIFERA.]

CORALLIA. [POLYPARIA CORTICIFERA.]

CORALLINES. [PSEUDOZOARIA.]

CORANTO, a quick dance. [COURANTE.]

CORBEL, a projecting piece of stone, wood, or iron, placed so as to support a weight of materials. Corbels are sometimes in the form of the modillion or mutule employed in entablatures, and also like the console of a window. Small semicircular towers projecting at the angles on perpendicular surfaces of large towers or other edifices are supported on a series of plain or moulded corbel stones. In some of the colleges in Oxford and Cambridge the mullions and roof of semicircular windows are supported in the same manner. The machicolations of towers are almost always supported on corbel stones, as may be observed in the old gates of Southampton, Canterbury, and York. This projecting of one stone beyond another is technically called 'corbelling out.' This is done in brickwork as well as in masonry. In the interior of some churches the construction of the roof appears to be supported on corbels, the ends of which are often carved, and represent an angel holding a shield. In Norman architecture the cornice is supported by a row of corbel stones, the ends of which are also carved. In old English castles the main beams of the floors were frequently carried on large corbel stones, as at Porchester Castle. The term bracket is sometimes used for a corbel. Bracket however is better applied as synonymous with cantilever. Small wooden brackets often differ from corbels and cantilevers in being merely nailed to a perpendicular piece of wood and not having a bearing on a wall, as is always the case with corbels and cantilevers.

CORCY'RA (Κέρκυρα, Kerkúra), the Roman name of the modern island of CORFU. Though the name is written Kerkura in the Greek authors, it seems that all the extant coins have ΚΟΡΚΥΡΑ (Korkura). [CORFU.]

[Coin of Corcyra.]

British Museum. Actual size. Silver. Weight, 76 grains.

CORD, frequently spelt chord, means an elastic string fixed at the two extremities and stretched with force sufficient to enable it to yield a musical note. [ACOUSTICS, vol. i., p. 97. Throughout this article A means the article Acoustics, and the page and column of vol. i. are referred to.] The close analogy which exists between a string and a column of air in a state of vibration would require more space to elucidate properly than this subject will allow us to give: we shall therefore assume some results of mathematical reasoning, point out the probability of those results, and consider the theory of the vibrating cord independently.

Firstly, we suppose our cord to be of uniform thickness and density, so that any given length is precisely of the same quality, from what part soever of the string it may be cut. The want of this condition being practically fulfilled is sometimes sensibly felt in violin and violoncello strings, which are then called *false*. A player whose intonation is perfect upon a perfect string, has to learn a new instrument when he attempts to play with a false string; to say nothing of the harmonics which must be heard more or less becoming discordant.

Let us first suppose a string of indefinite length, and not so acted upon by gravity as to hang downwards, stretched at the two ends by equal weights. The string is a cylinder of uniform diameter and density. Let us next suppose that a part of the string is placed on a mould which catches two points and holds them fast, and stretches the intermediate part into a curve which differs very little from a straight line. Let the mould be suddenly removed, and let us further suppose that, in removing it, we are able to communicate any velocities we please to the different points of the stretched part. We have then, at the moment of starting, a system represented in the following diagram, where AB

(dotted) represents the part in question before the mould was applied, and it is ACB the instant the mould is taken away, all the points between A and B being in a state of motion upwards or downwards. The string will not remain an instant in its present state: the first presumption is that the moment the points A and B are set free a disturbance will take place in the parts of the string both between P and A, and between Q and B, the disturbance travelling from A towards P as well as from B towards Q. The first point in which we are interested is this: with what velocity will the disturbance be propagated? and the answer is, that the disturbance travels throughout the string with the same velocity, depending upon its material and the weight with which it is stretched, according to the following law: Let each of the equal weights P and Q be as heavy as c feet of the string: then the velocity of communication is so many feet per second as a bullet would acquire, if it were allowed to fall *in vacuo* down a perpendicular of c feet, or $\sqrt{2gc}$ where g is the velocity which gravity communicates in one second, or $32\frac{1}{2}$ feet. For instance, let the string be iron wire, every cubic foot of which weighs 7200 ounces avoirdupois. Let the diameter be one-twentieth of an inch, and let the weights P and Q be each 20 pounds or 320 ounces. Then the weight of x feet of the string is ($\frac{1}{20}$ of an inch being $\frac{1}{240}$ of a foot)

$$3.14159 \times \left(\frac{1}{240}\right)^2 \times x \times 7200 \text{ ounces}$$

which made equal to 320 gives $x = 3259.5$ feet and

$$\sqrt{2 \times 32\frac{1}{2} \times 3259.5} = 457.93 = 458 \text{ nearly,}$$

or 458 feet per second is the rate at which the disturbance is communicated. [CYLINDER.]

We now ask what is the nature of the disturbance communicated. It suggests itself as possible, that there may be some species of disturbances which travel only in one direction: for instance, that we might so proportion the velocities of the disturbed points to their positions, that AP should remain undisturbed, that the points from A towards the right should drop one after another into their places, while those from B to Q should be successively disturbed. The answer, again derived from mathematics, is, that such disturbance is possible, and that the conditions under which it will take place are: 1. That C being the highest of the disturbed points, all the points from A to C must be moving *downwards* at the first instant, and all those from B to Q *upwards*. 2. That the velocity of the points must be as follows: At any point R draw a tangent RT to the curve of disturbance. Then the velocity of the point R must be such as would, if continued uniformly, carry the point R from R to N or from N to R in the same time as the whole disturbance is propagated from T to N. These conditions being fulfilled, we may represent the successive states of the string by cutting out a piece of paper of the form ACB, and carrying it along the string PQ at the uniform rate per second which we have found for the propagation of the disturbance. If the directions of the velocities be all reversed, then the disturbance travels from B towards P. Let us call such disturbances *simple*; and with respect to the direction in which they travel, *direct* or *retrograde*. We further learn from mathematical analysis, that any disturbances whatsoever, taking place upon the same points at the same instant, produce a compound disturbance of which the values of RN and the velocities at the point R in the compound disturbances are the algebraical sums of the values of RN, &c., in the component disturbances. And moreover, that any disturbance whatsoever, be the law of its form and velocities what it may, can be compounded of two simple disturbances, one direct and one retrograde. So that the moment the mould is removed, the disturbances will begin to travel in different ways. As long as they have not completely separated, there will be points remaining under the effects of both; but when they have had time to separate completely, we should, were the rapidity of transmission not too great, see the direct disturbance travelling by itself in one direction and the retrograde in the other.

To illustrate this, suppose we wish to ascertain the effect of the disturbance ACB, as drawn, the velocities throughout being nothing at all at the instant the mould is withdrawn. The two simple disturbances which would produce

this are two of the form $A c B$, such that at any point R the velocity would bring the point through RN while the disturbance is communicated through AN. If we suppose a direct and retrograde disturbance of such a kind, there will be at the first moment no velocity at any point of ACB, since those of the direct and retrograde disturbance com-

pensate each other throughout. But let a time elapse during which the direct and retrograde disturbances travel to M and L. Then the form of the string at that moment will be $A c m n c B$, where the part $m n$ arises from the composition of the two parts of the disturbances which yet remain acting on the same points. (See another instance of composition, A. 92.)

We may thus trace the effect of disturbance upon an indefinitely extended string; but such a string would produce no musical sound, for which (A. 95, 2) it is necessary that there should be a continued reiteration of the same action upon the air repeated at equal intervals. Now supposing a finite string, stretched at the ends, we must ask what takes place when the disturbance comes to the end of the string. And from mathematical analysis again, the following is the answer: Let P be the fixed end of the

string, and choose the instant at which, had the string continued, the disturbance would have been BVA. Make a disturbance HA' equal and opposite to GA, and let it be compounded with GVB, on the supposition that it is part of a disturbance proceeding from P, such as would by itself bend the string in the opposite direction. Then PVB or PVA' is the state of the string at that instant. In fact, the disturbance is converted into an equal and opposite disturbance proceeding in the contrary direction.

Now let us suppose a string like that of a piano-forte, sharply struck near one end. It is altogether a gratuitous assumption, knowing what we do of the imperfect elasticity of matter, to suppose that the disturbing effect of the blow immediately affects the whole string. A certain disturbance is produced upon a part (it may be a very small part) of the string. Then what is that perceptible phenomenon, the reiteration of which produces a musical tone? Let us suppose the string struck at one-fourth of the length from its end, and suppose that the tension is such that disturbance is propagated at the rate of 2000 feet a second, the length being four feet. A disturbance is produced at M,

from which two simple disturbances begin to travel towards P and Q, at which they are reflected with the same velocities. They will be at N together producing a disturbance (now recomposed) of the same amount as before, but on the opposite side of the string. This takes place while four feet are described at 2000 feet per second, or is repeated 250 times per second. From M to N there is then a succession of effects upon the air, which are most powerful at M and N, owing to the coincidence of the disturbances. This is repeated 250 times in a second, and

yields the musical note corresponding to that number of aerial pulsations per second.

We must again advert (A. 97-2) to the use of the term vibration. The complete vibration in our use of the word is made while the disturbance travels from M to N. Thus some writers say 16 vibrations per second give the lowest musical sound, where we say it is 32. But their vibration is double of ours.

By supposing the whole string put in vibration, or any simultaneous disturbances communicated to it, the effect may similarly be shown to be, that at the end of the time during which disturbance would be propagated along the whole string the effects are all reversed, but are of the same magnitude; while in a second of such time they are all restored. We thus easily arrive at what is called the fundamental sound of a string. With regard to the harmonics (A. 96-2) of a string [HARMONICS], they are not so easily shown to be necessary. We shall, however, first show that such effects are always possible; that is to say, that if a string begin to vibrate so that its two halves, or its three thirds, &c. are disturbed together, such an effect will be produced. Suppose, for instance, the initial state of the string to be PMNQ, where PM, MN, and NQ are the

thirds. During the time in which the direct disturbance of PM would be communicated to MN, that of MN would be communicated to NQ, the direct disturbance in NQ would be made retrograde, and so on. Hence though the whole string may vibrate, each of the parts has a vibration by itself in one third of the time. If we were to destroy the vibration of the whole string by compounding with the preceding such a disturbance as would always destroy the velocities at M and N, there would then be three strings, each vibrating in one-third of the time of the whole string. The ear can appreciate such contemporaneous sets of vibrations, and accordingly in this case perceives both the fundamental note of the string and the twelfth above it. If a large and miscellaneous set of disturbances be communicated at once, those only will exhibit cycles of effects, which make the halves, the thirds, &c. vibrate together, and we can say little more without entering into mathematics. But in a string it may always be observed that we seldom hear the octave of the fundamental note, and generally the twelfth and seventeenth. No reason can be given for this which is perfectly unobjectionable; we do not know whether it is the aptitude of the ear to distinguish these, or of the string to take the corresponding divisions, which is the cause of the phenomenon.

The time of vibration of a string, that is, of complete reversal of all the initial effects, is $l \div \sqrt{2gc}$, where l is the length, and c is as before. It is therefore directly as the length and inversely as the square root of the tension; results which are amply confirmed by experiment.

In all that has preceded we have supposed the string perfectly elastic, and without friction. Neither of these suppositions is true, but since the velocity of propagation of every disturbance is independent of its extent, the gradual diminution of the latter will not affect the phenomenon on which the musical qualities of the string depend.

(A. 97-2.) The method of observing the curves in which each point of a string vibrates, recommended by Dr. Young, was to use a string round which small wire is coiled, like the larger string of a violoncello, and to observe with a microscope the reflection of a candle or other bright spot on one of the coils. Sir J. Herschel suggests that a thin slit should be made in a window-shutter, and that the string should be placed with the point to be examined cutting the vertical plane of light. This point would therefore appear bright while the rest is dark. In either case the rapidity of the vibrations would make the curve described by the bright point permanent.

A single string fitted up for experiments is called a MONOCHORD.

CORD (in music). [CHORD.]

CORDAY D'ARMANS, MARIE ANNE CHARLOTTE, commonly called CHARLOTTE CORDAY, who numbered among her ancestors the great tragedian Corneille (Lepau, *Chefs d'Œuvre de Corneille*), and was of noble family, was born at St. Saturnin, near Seez, in Normandy, in 1768. The republican principles of the early

revolutionists struck deep root in her enthusiastic mind; and her zeal for their establishment was heightened after the rise of the Jacobins, and the overthrow and proscription of the Girondists, May 31, 1793, by the presence and conversation of those chiefs of the latter party who fled into Normandy, in hope to rouse the people in their favour. Resolved to advance the cause which she had at heart by some extraordinary action, Charlotte Corday travelled to Paris, where, having gained admission to the galleries of the Convention, she was still more incensed by the threats and invectives which she heard showered upon her own friends.

Being thus confirmed in the determination to assassinate one of the principals of the dominant faction, whether to deter them by terror, as an act of revenge, or as an example of what she regarded public justice, she chose Marat, one of the most violent and bloody of the Jacobins, to be her victim. After two unsuccessful attempts, she obtained admission to the chamber in which he was confined by illness, July 15, under pretence of communicating important news from Caen; and being confirmed in her purpose by his declaration that in a few days the Girondists who had fled thither should be guillotined in Paris, she suddenly stabbed him to the heart: he gave one cry and expired. Being immediately arrested and carried before the *tribunal révolutionnaire*, she avowed and justified the act. 'I have killed one man, she exclaimed, raising her voice to the utmost, to save a hundred thousand; a villain, to rescue innocents; a wild beast, to give peace to my country. I was a republican before the revolution, and I have never been wanting in energy.' (Mignet, vol. ii., p. 5.) Notwithstanding her confession, the court, with an affectation of impartiality which in this case could be ventured on, assigned her a defender, and went through all the formalities of trial. The speech of her advocate is rather remarkable. He neither denied nor extenuated the act; and acknowledged it to have been long premeditated. 'She avows everything, and seeks no means of justification; this, citizen-judges, is her whole defence:—this imperturbable calmness, this total self-abandonment—these sublime feelings, which, even in the very presence of death, show no sign of remorse, are not natural. It is for you, citizen-judges, to fix the moral weight of this consideration in the scales of justice.'

Charlotte Corday returned thanks to the pleader. 'You have seized, she said, the true view of the question: this was the only method of defence which could have become me.' She heard her sentence with perfect calmness, which she maintained to the last moment of life. Her personal charms were of a high order; and her beauty and animation of countenance, even during her passage to execution, added greatly to the interest inspired by her courage and loftiness of demeanour. She was guillotined July 17, 1793. (*Biog. Univ.*; Montgaillard, *Hist. de France*, &c., vol. iv., p. 55—59.)

CORDELIERS, so named from wearing a knotted cord for a girdle, were the strictest branch of the Franciscan or Grey Friars. Chaucer mentions them in the 'Romant of the Rose,' l. 7461, but they were not much known by this appellation in England. The name Cordeliers is said to have been first given to certain Franciscans (at that time but recently established) who accompanied the army under St. Louis to the Holy Land. They served in a Flemish corps, the commander of which considered it his duty to report to the king not only their bravery, but their zeal in re-animating the soldiers of his division, who had been on the point of giving way. The king inquired the designation of the pious men, but the officer had lost his recollection of it; he could only say that they were those 'qui sont liés de corde.' From this they received the new appellation of Cordeliers. St. Louis, upon his return to France, gave great encouragement to these Franciscans, and founded a convent for them in Paris. There were ultimately, according to Moreri, no fewer than 284 male and 123 female convents of Cordeliers in that country. (Moreri, *Dict. Historique*, chiefly from Hermant, *Histoire des Ordres Religieux*.)

CORDIA'CEA, a small natural order of Monopetalous exogens, with a shrubby or arborescent habit, a gyrate inflorescence, and a drupaceous fruit. The leaves are alternate, usually covered with asperities, and destitute of stipules. The calyx is inferior and five-toothed; the corolla regular, with five stamens proceeding from the tube, and alternate with the segments. There is a pendulous ovule in

each cell, and the style is twice-forked. The cotyledons are crumpled or folded in plaits lengthwise. The affinity of the order is almost equal between Boraginaceæ and Convolvulaceæ, but preponderates in favour of the former. The only economical plants contained in it are the Sebesten plums, the produce of *Cordia Myxa* and *Sebestena*, the rind of which is succulent and mucilaginous. All the species are tropical.

CORDON, a military term to denote a line of posts and sentries placed around a district or town to prevent any communication between it and the rest of the country. It is chiefly resorted to in cases of any contagious disease having broken out in a place, when it is called a cordon sanitaire; and in order to be effectual, each sentry ought to be able to see his two next comrades right and left. This can be done more easily in the day-time by taking advantage of commanding positions or open grounds; but at night the sentries must necessarily be more numerous and nearer each other.

Cordon in French means also the insignia of an order of knighthood, answering to the English word riband when taken in a similar sense: 'cordon bleu,' 'blue riband,' &c.

CORDONNIERS, originally cordouanniers, cordwainers in English, a word derived from cordoban, the soft tanned leather used for the upper part of shoes, which was first brought from Cordova in Spain, where it was manufactured by the Moors. A society existed at Paris in the sixteenth and seventeenth centuries, under the name of Frères Cordonniers, consisting of the shoemakers of that city, who formed a company, having their magistrates and other officers, and a common treasury, from which the indigent of their own trade were supported. The society was placed under the protection of St. Crispin, who had been himself one of the same trade.

CO'RDOVA, or more properly **CO'RDOBA** (*Corduba*, *Colonia Patricia*, and simply *Patricia*), was the birth-place of the two Senecas and Lucan. Cicero in his oration for Archias speaks rather disparagingly of the Cordubese poets of his day. Under the Spanish caliphs it became the first seat of learning and the terror and admiration of Europe, from 755 to 1234, when Ferdinand III. of Castile took it. It then contained 300,000 inhabitants. Soon after, in 1238, he repelled its masters, the Moors, as far as Granada, and prepared their total overthrow, which Ferdinand and Isabella accomplished in 1492. Of all the Asiatic grandeur of that empire there is only left its first mosque, which is unique in its kind, but has been partly defaced by its transformation into a Christian cathedral, more particularly since 1528, when some of its 1000 columns were destroyed to erect a chapel in the centre.

Cordova was also the centre of an extensive trade, and noted for the preparation of the goat skins called *cordoban*, a word corrupted into our cordwain, whence shoemakers derived in England their old name of cordwainers, and in France that of cordouanniers, and at last cordonniers.

Although Cordova has sunk into decay under the Christians, it has not ceased to produce literary men, among whom are Juan de Mena, Fernan Perez de Oliva, Ambrosio Morales, Góngora, &c. The great captain, although called Gonzalo de Cordoba, was a native of Montilla.

Cordova at present contains only 45,000 inhabitants within its vast Roman and Moorish inclosure. The *plaza mayor*, or great square, is remarkable for its size, regularity, and neat piazzas. The bishop's palace is a massive building. That of the Moorish kings is now turned into stables for stallions of the renowned Cordovese breed. The town is situated on the north bank of the navigable river Guadalquivir, at the commencement of the finest plain of Andalusia, and on a gentle declivity which descends from the Sierra Morena, and shuts out the north and east winds. The climate of Cordova is delightful and healthy, and the soil extremely fertile. It is 75 miles north-east of Seville, 120 north-east of Cadiz, and 180 south-south-west of Madrid. It is in 37° 52' N. lat., 4° 45' W. long.

(Ponz, *Viaje de España*; Laborde, *View of Spain*, vol. ii., p. 29; Gibbon's *Rome*; Talbot's *Travels*; Fisher's *Travels*, &c.)

COREA, is a large peninsula on the eastern coast of Asia, whose sovereign is tributary to the emperors of China and Japan, but otherwise independent.

The peninsula is surrounded on the east by the sea of Japan, on the south by the straits of Corea—which divides it from the Japanese island of Kiou-siou—and on the west by the Hoang-Hai, or Yellow Sea, which separates it

from China Proper. It extends, from south to north, from 34° to 40° N. lat., or about 420 miles; but the countries north of the peninsula, as far as 43°, are also subject to the sovereign of Corea, so that the whole country from south to north may be 630 miles. Its width, lying between 124° and 134° E. lat., varies from 100 to 200 miles. Its area may be about 90,000 square miles, or somewhat more than Great Britain.

Corea appears to be a very mountainous country. On its northern boundary is the Chang-pe-shan, a high mountain-range, partly covered with snow, which separates the Coreans from their northern neighbours, the Manchoo. From this chain another branches off in a south-south-east direction, which traverses the whole of the peninsula as far as the strait of Corea. Its highest part is near the shores of the sea of Japan, towards which it descends with great rapidity; and in this part the level or cultivable tracts are of small extent. The numerous offsets to the west, which are less elevated and steep, contain between them large and well-cultivated valleys.

The largest rivers occur in the northern part of the country, where the Thumen-Kiang, rising in the centre of the Chang-pe-shan, runs north-east, and towards its mouth east. It falls into the sea of Japan. Its banks, though fertile, are uninhabited, in conformity to the order of the Chinese emperor; the object of this policy being to have a well-settled boundary between Corea and the Manchoo. The Yalu-kiang rises nearly in the same place, and runs first west, then south. It falls into the Hoang-Hai, according to the Chinese geographers, with twelve mouths. It is said to be navigable for junks 35 miles (100 lees), and for barges about 180 miles (520 lees). The rivers which traverse the valleys of the peninsula have a short course.

The coasts of Corea are high and bold, except in the innermost recesses of the numerous bays and harbours. There are few islands along the eastern shores, except in Broughton's Bay (39° 30' N. lat.), where they are numerous. In the strait of Corea they are also very numerous, and still more so between the island of Quelpaerts and the southern coast. Between 34° and 35° N. lat. and 125° and 126° E. long., Captain Maxwell found the sea literally dotted with islands and rocks, which he called the Corean Archipelago, and the most south-western group Amherst Isles. Farther north (38° N. lat.) is another group, called James Hall's Archipelago. These islands are rocky and high, but generally inhabited. They are rarely more than three or four miles in length. The largest, the island of Quelpaerts, south of the peninsula, is about sixty miles in circuit, and in the centre a peak rises upwards of 6000 feet above the sea.

Corea is a very cold country. For four months the northern rivers are covered with ice, and barley only is cultivated along their banks. Even the river near King-ki-tao freezes so hard that carriages pass over the ice. In summer the heat appears not to be great. On the eastern coasts fogs are frequent; and La Perouse thinks he may compare them in density with those along the coasts of Labrador.

Rice is extensively cultivated on the peninsula, as well as cotton and silk, which are employed in the manufactures of the country, and exported in the manufactured state. Hemp is also cultivated, and in the northern district ginseng is gathered. Tobacco is raised all over the country.

Horses and cattle are plentiful on the mountain-pastures. The former, which are small, are exported to China. In the northern districts the sable and other animals give fur. The royal tiger, which is a native of the country, is covered with a longer and closer hair than in Bengal. On the eastern coast whales are numerous. It seems that Corea is rich in minerals. Gold, silver, iron, salt, and coals, are noticed in the Chinese geography.

The inhabitants, who are of the Mongol race, resemble the Chinese and Japanese, but they are taller and stouter. Among them are some whose appearance seems to indicate a different origin. They speak a language different from the Chinese and Manchoo, though it contains many Chinese words. They have also a different mode of writing it, though the Chinese characters are in general use among the upper classes. In manner and civilization they much resemble the Chinese, and are likewise Buddhists. Education is highly valued, especially among the upper classes. They seem to have a rich literature of their own, but their language is very imperfectly known in Europe. The valleys seem to be well peopled; but we are so little acquainted with the interior, that hitherto nobody has ventured to give an estimate of the population.

King-ki-tao, the capital, which is a few miles north of a considerable river Han-kiang, appears to be a large place, and is said to possess a considerable library, of which one of the brothers of the king is chief librarian. The name of this town is properly Kin-phu, near Hanhang, or Hanyang. The mouth of the river Tsing-kiang (between 34° and 35°), on the western coast, is said to have a very spacious harbour.

Fushan, according to the Chinese geography, called by Broughton Chosan or Thosan, is a bay at the south-eastern extremity of the peninsula, opposite the Japanese island of Tsu-sima, at the innermost recess of which the town of King-tsheou is built, which carries on an active trade with Japan, and is the only place to which the Japanese are permitted to come.

In industry the Coreans do not appear to be much inferior to the Chinese and Japanese. They mainly excel in the manufacture of cotton cloth and cotton paper, both of which are brought in great quantities to Peking. Other manufactured articles which are exported are silk goods, plain and embroidered, and mats. They have attained considerable skill in working iron, as swords are sent, with other articles, to the emperor of China as tribute.

No country is less accessible to Europeans than Corea. They are not permitted to remain even a few days on any part of the coast. It is not well known what is the reason of this policy, but it seems that the mutual jealousy of the neighbouring Chinese and Japanese holds the king in great subjection. The commerce of the country is accordingly limited to China and Japan; and even with these countries is restricted in a very strange way. No maritime intercourse is allowed between China and Corea, but all commerce is carried on by means of the narrow road which leads along the sea to the town of Fang-hoan, in Leao-tong. But as it traverses the wide district which by order of the Chinese emperor must remain uninhabited, it has become the haunt of numberless ferocious animals, and hence the passage is much dreaded by travellers. Commerce therefore is principally carried on in winter, when the shallow Hoang-Hai is covered with ice along its shores, which are more favourable to the transport of goods than the bad mountain-roads. Besides the above-mentioned manufactured goods, gold, silver, iron, rice, fruits, oil, and some other articles, are brought by this road to Peking. We do not know what the Coreans take in return to their country. The commercial intercourse between Corea and Japan is limited to that between the island of Tsu-sima and the bay of Chosan, and is carried on by Japanese merchants, who have their warehouses at each place. They import sapan-wood, pepper, alum, and the skins of deer, buffalos, and goats, with the manufactured articles of Japan, and those brought by the Dutch from Europe; they take in return the manufactures of Corea, and a few other articles, especially ginseng.

We know nothing of the political condition of the country, except what is communicated by Klaproth from the Japanese geographer Rinsifée; according to whom there are sixty-four commanders of 10,000 men, which would give an army of 640,000 men, and 213 war-vessels. Ritter thinks that these and many other statements of the geographer are taken from the court-almanac of King-ki-tao, and that little reliance can be placed on them. (Broughton; Maxwell, in Ellis's *Journal of Lord Amherst's Embassy*; MacLeod; Basil Hall; Hamel van Gorcum; Klaproth, in *San Kohf Tsou*; and Ritter's *Asien*.)

CORELLI, ARCA'NGELO, on whom his countrymen bestowed the cognomen of 'Il Divino,' was born at Fusignano, in the Bolognese territory, in 1653. Adami says that his instructor in counterpoint was Simonelli; and it appears pretty certain that his master for the violin, the instrument of his early adoption, and which he never abandoned, was Giambattista Bassani of Bologna. It is stated by the Rev. Mr. Mainwaring, in his *Life of Handel*, that Corelli went in 1672 to Paris, but that through the jealousy of Lully he was soon obliged to quit that city. On this fact Dr. Burney attempts to throw discredit, but there is no reason to doubt its correctness. In 1680 Corelli visited Germany, where he received extraordinary honours, not only from the public, but from sovereign princes, among whom the elector of Bavaria distinguished himself by the hospitable manner in which he treated the great musical genius. He returned to Rome at the expiration of about two years, and published his first set of 'Twelve Sonatas for two Violins and a Base,' in 1683. A second series appeared in 1685, entitled 'Balletti da Camera.' These were succeeded in 1690

by a third set; and the fourth was published in 1694. His admirable sonatas for violin and base, or harpsichord, in which all violinists are early initiated, were printed, with a dedication to the electress of Brandenburg, in 1700. When James II. sent, in 1686, the earl of Castlemaine as ambassador to the pope, Christina of Sweden, then at Rome, celebrated the event by having an opera written, composed, and performed, in the holy city. The band employed on this occasion consisted of 150 stringed instruments, a prodigious and unprecedented force for those days, and Corelli was chosen as leader, which duty he performed in so satisfactory a manner, that the Italian opera in Rome was placed under his direction chiefly, and in 1700 had arrived at a degree of excellence which it had never before attained in the capital of Italy. He now gained the friendship of the well-known patron of art, the Cardinal Ottoboni, at one of whose *Accademie* he met Handel, then travelling in Italy. As a mark of attention to the great German composer, the cardinal had the serenata, *Il Trionfo del Tempo e della Verità* (afterwards altered into *The Triumph of Time and Truth*) performed, the overture to which being in a style quite new to Corelli, he led it in a manner that displeased the irascible composer, who rudely snatched the violin from the hands of the gentle Italian. Corelli no farther resented this indignity than by calmly observing, *Mio caro Sassone, questa musica è nelle stile Francese, di ch' io non intendo.* (My dear Saxon, this music is in the French style, which I do not understand.) Some satire was half concealed in this remark, for Handel at that time certainly imitated Lully's overtures, and the inuendo, which was a lenient punishment for conduct so violent, could not have been misunderstood by him. Corelli, however, though an exquisite performer in regard to expression and taste, had devoted more of his attention to those high qualities which ought to be considered paramount to all others, than to what is commonly understood by the term execution; he consequently was sometimes embarrassed by having music placed before him which at first sight he could not easily master, and was abashed on finding that musicians infinitely inferior to himself could play it without preparation or hesitation. It was at Naples that he met with some mortifications of the kind alluded to, which prompted him to quit abruptly, and somewhat chagrined, that city, to which he had been very warmly invited, and where it was intended that he should be received with every mark of distinction.

Corelli's greatest work, his *Concerti Grossi*, or Twelve Concertos, were written many years before they appeared in print. They were engraved in score at Amsterdam, and published in December, 1712, six weeks only before their author breathed his last, an event which took place on the 18th of January, 1713. He was buried in the church of *Santa Maria della Rotonda* (the antient Pantheon), where a monument, with a marble bust, is erected to his memory, near that of the greatest of painters, Raffaele. On the pedestal is a Latin inscription by the cardinal Ottoboni, which records in simple and elegant terms the merits of the composer and the friendship of the writer.

Like many other original geniuses, Corelli was too sensitive to be happy. Occurrences which he should have suffered to pass unnoticed made a deep impression on him, even to the injury of his health. The success of Valentini, whose concertos and performance, though infinitely inferior to Corelli's, became fashionable at Rome, so much affected the great composer—who, having acquired much wealth, ought to have treated fashion with the disdain it generally deserves—that it is supposed to have aggravated the malady which caused his death. Corelli's best works are imperishable. Rousseau has said, that he who without tears can listen to Pergolesi's *Stabat Mater* may feel assured that he has no genius for music. We will also risk an assertion—that those who can without admiration hear the eighth concerto of Corelli, as performed at the Antient Concert, though they may be able to boast great powers of execution as instrumentalists or vocalists, can have no perception of the higher beauties of composition—can possess no soul for pure harmony.

CORFE CASTLE. [DORSETSHIRE.]

CORFU, the island of, the antient Corcyra, lies off the coast of Epirus, from which it is separated by a channel of very irregular width, being fourteen miles in some places, eight miles opposite the town of Corfu, and only two at its north outlet near Butrinto. The length of the island, which describes a slight curve from Cape St. Catharine,

Cassiope Promontorium, in $39^{\circ} 51'$ N. lat., to Cape Bianco, in $39^{\circ} 21'$, is about 38 miles. Its breadth is very unequal; in the north part, which is much the widest, it extends nearly 20 miles, from $19^{\circ} 36'$ to $19^{\circ} 57'$ E. long. Further south, the island becomes very narrow, being only six miles between the Bay of Yliapades to the west, and the harbour of Gouin to the east. It widens again in the latitude of the town of Corfu, where it is about eleven miles; it then contracts to the south of it, to three or four miles in breadth, terminating in a high narrow cape. (*Map of the N. part of Greece*, published by the Soc. for the Diffusion of Usef. Know.) The surface of the island is of 227 square miles, and is generally mountainous, especially in the north part. The highest point, according to F. Beaujour, is about 1900 feet above the sea. The mountains are rocky and naked, but the valleys are fertile, and watered by many streamlets, which, however, are mostly dry in summer. The most considerable streams are the Missongi and the Potamo. The island produces oil, wine, vegetables, fruit, flax, and some corn and pulse. Unlike most of the other islands, Corfu produces no currants. There are but few timber-trees on the island. The cattle consists of horses, mules, sheep, and pigs. The game consists of wild fowls, snipes, quails, pigeons, &c. Oil forms the principal article of exportation, and the making of it employs about 1000 presses. The wine, which is mostly of a rough taste, is used at Corfu and in the other islands. Salt is got in considerable quantity in the salt-marshes, which communicate with the sea.

The island is divided into seven cantons: 1°, Corfu, with the town of that name, which is the capital of the island, as well as of the Ionian Islands. The town consists of three parts, the citadel, the town properly so called, and the suburbs. The citadel, which is at the extremity of a cape, and divided from the town by wet ditches and an esplanade, forms a little town with several private houses and churches, and the palace of the lord high commissioner, besides the arsenal and barracks. Two strong castles built upon steep rocks command the whole. The town, properly so called, is surrounded by walls and ramparts, and strengthened by several forts, called Fort Tenedos, Fort Abraham, Fort St. Salvador, and the New Fort. Three gates open on the sea-shore and one on the land-side. The houses are mostly two stories high, with terraces at the top. The streets are tolerably well paved, and are lined with arcades. The cathedral and five other churches belong to the Greek Latin church; there are also many churches and chapels of the Greek communion, among which that of S. Spiridion is the principal. Corfu is the residence of the archbishop of the Greek Latin church, of the senate, the high court of appeal for all the islands, as well as the civil, criminal, and commercial courts for Corfu. The university, which was first opened by Lord Guilford as chancellor in 1824, has four faculties, theology, law, medicine, and philosophy, and fourteen professors. The lectures are given in modern Greek. There are also a secondary school or gymnasium, an ecclesiastical seminary, and several primary schools, all supported by the government, at the annual expense of 3483*l.* sterling; and a society for the improvement of agriculture and industry. There is an account of the system of instruction followed in the secondary schools of the Ionian Islands in *Journal of Education*, No. I. The harbour of Corfu, which is one of the best in the Levant, and has a depth of about 80 feet, is formed by the island of Vido, the rocks called Condilonisi, the Lazzeretto island, and the New Fort.

There being a great scarcity of spring water in Corfu, cistern water is commonly used, and in summer the water for drinking is brought on asses from the river Potamo, about a mile and a half from the town. The suburbs, called Castrati, S. Rocco, and Mandrachio, are considerable. The whole population of the town and suburbs is 15,800, 4000 of whom are Jews. (Neigebaur.) From the suburb of Castrati a walk of about a mile and a half in a southern direction leads to the small bay of Palæopolis, where Chrysopolis, the town of the Phæacians, is said to have stood. The shores of this bay are planted with myrtle, laurel, pomegranate, and orange trees, and are the favourite resort of the citizens. They are called the gardens of Alcinous. (Marmora, *Istoria di Corfu*, with plates of many fine coins of antient Corcyra.)

The other districts of the island are: 2°, Liapades, with the town of the same name, 2500 inhabitants; and Chora-chiana, with 2000; besides several villages. 3°, Peretia,

which comprises the north-eastern part of the island; the little town of the same name lies at the foot of Mount San Salvador, the highest in the island, having a convent on the summit. On the sea-coast, near the site of the old town of Cassiope, rises a village still called Cassopo. 4°, Agrafus occupies the north-western part, with the little town of the same name, and several hamlets. Twelve miles north-west of this part of the coast is the island of Fano, which lies about 50 miles from the nearest point of the coast of Otranto in Italy. The island is six miles round, barren, and inhabited by a few fishermen. 5°, Spagus, which lies south of the preceding, is the most fertile and populous in the island; it has two good natural harbours, San Nicolo and Affiona. On Cape S. Angelos is a monastery, which stands on the ruins of an old castle built in the thirteenth century by Michael duke of Corfu. 6°, Strongili, south of the canton of Corfu, has two small market-towns and several villages. 7°, Milichia, the southernmost canton, is fertile, and contains about 10,000 inhabitants. (Neigebaur, *Ionische Inseln*.)

The Phæacians, the oldest known inhabitants of the island, are mentioned by Homer as a numerous, thriving, and seafaring people; and he paints in pleasing colours their hospitable and primitive manners. (*Odyssey*, vi. vii.) According to some (Strabo, Casaub. 269), it was called Scheria, and was inhabited by the Liburni, when a Corinthian colony settled on the island, about the time when another colony under Archias founded Syracuse. The Corinthians built the town of Corcyra, which became also the name of the island. This colony rose to be the most powerful naval state of Greece, next to Athens. The Corcyraeans having quarrelled with the Corinthians on the subject of Epidamnus [COLONY], a war followed between the two states, which was a prelude to the great Peloponnesian war. Corcyra had at first the advantage, and defeated the Corinthian fleet off Actium; but the Corinthians being joined by other states of the Peloponnesus, the Corcyraeans had recourse to Athens, which made a defensive alliance with them. The Corcyraean fleet of 110 triremes, besides ten Athenian auxiliary ships, engaged with the Corinthian fleet at the south entrance of the channel, near the coast of Thesprotia. The fight ended in favour of the Corinthians, but the appearance of a fresh Athenian squadron of twenty triremes induced them to return home. (Thucyd. i. 50-1.) After this, Corcyra was distracted by civil commotions between the aristocratic and democratic factions, the former being favourable to the Peloponnesian or Spartan alliance, and the latter to the Athenian. Atrocities were committed by both, which ended in a general massacre of the aristocratic party, connived at by the Athenian commander. (Thucyd. iv. 47-8.) This tragedy occurred B.C. 425. The island remained in the Athenian alliance till the end of the war.

The Illyrian pirates took Corcyra, as well as several towns on the coast of Epirus, about 220 B.C.; but the Romans under Caius Fulvius came with a fleet, defeated the Illyrians, and retook Corcyra, which from that time seems to have remained under the patronage of Rome. (Polybius ii. 1.) About 210 B.C., we find the consul Valerius Lævinus stationed at Corcyra with his fleet, giving assistance to the Ætolians in their wars against the Acarnanians. (Livy xxvi. 24.) Corcyra under the Romans was an important station for their fleet, and also a resting-place for those who went and came from Greece by way of Brundisium. It continued to belong to the eastern empire until the eleventh century of our æra, when Robert Guiscard, the Norman conqueror of Apulia, took the island. When the Latins took Constantinople, and established fiefs in the provinces, Corfu had its dukes, who were styled Despots of Epirus and Corfu. It fell afterwards under the Angevins of Naples, but the people revolted and called in the Venetians in 1386. Corfu remained under Venice till the end of the eighteenth century, notwithstanding repeated attacks of the Ottomans, the most remarkable of which was in 1714, when they besieged Corfu with 30,000 men, and made several assaults, but were repulsed by General Schulemburg, who commanded the garrison. The island was administered by Provveditori sent from Venice; but the internal or municipal administration was in the hands of the native nobles. The judicial system appears to have been bad, and murders were very frequent. When Bonaparte overthrew the Venetian senate, under pretence of establishing a popular government, the democrats who came into office at Venice sent commissioners to Corfu with orders to deliver the forts to their

allies the French, who sent troops on board the Venetian men of war, and took possession of the island without opposition. In 1799 a united Russian and Turkish force wrested Corfu from the French, and in the following year the republic of the seven united Ionian islands was constituted under the protection of Russia and the Porte. By the peace of Tilsit Russia gave up the seven islands to the French, who sent garrisons from the coast of Naples. The English however took all the islands except Corfu, which was given up by France by the peace of Paris in 1814. The seven islands were then restored to their independence, and formed into a state under the protection of the king of Great Britain, represented by a lord high commissioner, who resides at Corfu.

The present constitution of the seven islands was proclaimed in January, 1818, under the sanction of Great Britain. The parliament or legislative assembly consists of forty members, eleven of whom have their seats *de jure*, consisting of the six members of the last senate, of the four regents of the larger islands going out of office, and one of the regents of the three smaller islands taken by turns. The other twenty-nine members are elected by the electoral bodies of the different islands, seven for each of the islands of Corfu, Cephalonia, and Zante, four for Santa Maura, and one for each of the other three islands, Cerigo, Ithaca, and Paxo. They are elected for five years, which is the term of duration for each parliament, unless it be dissolved before that period by the lord high commissioner. The members, as well as the electors, are all of the class of nobles, which is numerous, including almost all the landed proprietors. The qualifications requisite in order to be inscribed among the nobles are specified in the constitutional charter given by the Emperor Alexander in 1803, in conformity with the old usages of the country, by which the inhabitants were classed into three orders, nobles, burghers, and peasants. The burghers may become nobles on certain conditions. The peasants are free in their persons, but have no elective rights, and they are generally very poor.

The senate, which consists of a president and five members, all from the class of the nobles, forms the executive. The president, who has the title of highness, is appointed by the king of Great Britain: the other five members are chosen by the parliament, subject to the approbation of the lord high commissioner. The senators are elected for five years; the president is appointed for two years and a half: the senate appoints to all administrative offices and situations.

The lord high commissioner convokes the parliament once a year, and opens the session by a speech. He also prorogues or dissolves it. Bills are brought before the House, either from the senate, or from the lord high commissioner through the senate, or lastly, by any member of parliament. After passing the House of Parliament, the bills must be approved by the senate, and lastly must receive the sanction of the lord high commissioner.

In every island there is a regent, or chief civil and political officer, appointed by the senate, and likewise a resident appointed by the lord high commissioner. There is also in each island a municipal council, named by the order of nobles; the regent is the ex-officio president of the council. In every island there are also civil, criminal, and commercial courts, the judges of which are appointed by the senate. A high court of appeal for all the islands, called the Supreme Court of Justice, sits at Corfu, and is composed of four judges, two appointed by the senate and two by the lord high commissioner, who may choose them indiscriminately among Ionian natives or British residents.

The lord high commissioner commands the armed force, which consists of a British establishment of about 3000 men, and four regiments of native militia.

The eastern Greek church is considered as the established religion of the state; but the Roman or Greco-Latin church enjoys equal protection. The archbishop and bishops of the established church are consecrated by the patriarch of Constantinople. (*Constitution of the Ionian Islands*, in Dufay's *Recueil de Constitutions*, &c.)

According to the printed official returns of 1833, the whole population of the seven islands was 107,379 males, and 90,588 female natives, besides 11,179 strangers. That of the island of Corfu was 32,909 male and 27,098 female natives, besides 9040 strangers. Of this population about 15,000 were employed in agriculture, 1621 in manufactures, and 1443 in commerce. There were on the island 4005 acres sown with wheat, about 16,500 acres sown with

Indian corn, barley, oats, and other grain, 75,700 acres planted with olive trees, 13,900 with vines, about 1000 with pulse, 848 with flax, and 7422 in pasture, besides 33,272 acres uncultivated. There were on the island 4194 horses, 2341 horned cattle, 18,585 sheep, and 16,743 goats. The value of the exports for that year was 129,000*l.* sterling, and the imports were 83,000*l.* The shipping inwards was 254,000 tons, and the outwards 255,000, about one-half of it consisting of Ionian vessels. (*Tables of the Revenue, Population, &c., of the United Kingdom and its Colonies*, Supplement to Part IV.)

CORIA'NDRUM SATIVUM or **COMMON CORIANDER**, is an annual umbelliferous plant, inhabiting the southern parts of Europe, and yielding a globular dry fruit, with slight carminative stomachic properties, and a powerful smell something like that of bugs. The leaves that grow next the root are nearly entire or gashed, and wedge-shaped; the stem-leaves have a bipinnatifid structure, and their segments are deeply divided; while the uppermost leaves are parted in many very narrow linear spreading segments. The flowers are pale pink, with no general involucre, but with partial ones, each of which consists of eight sharp linear leaflets. The fruit is globular, and will separate into two hemispheres, each of which has five very imperfect wavy primary ridges and four secondary straight elevated ones. There are no vittæ on the outside of the hemispheres, but two occur in their commissure.

[*Coriandrum sativum*.]

1. A portion of an umbel, in fruit. 2. A fruit magnified. 3. A transverse section of the same.

Coriander fruit, or seeds as they are incorrectly called, are used in sweetmeats, in certain stomachic liqueurs, and in some countries in cookery; they are little esteemed in England.

CORIARIA'CEÆ, a very small natural order of gynobasic polypetalous exogens, with opposite or alternate exstipulate leaves, ten stamens with an hypogynous inser-

[*Coriaria myrtifolia*.]

1. A flower with its bract, the anthers not yet visible. 2. The same with the anthers projecting. 3. A cross section of the ovary. 4. A seed. 5. A vertical section of the same.

tion, and five distinct ovaries, with distinct spreading stigmas. The two genera, of which alone the order consists, are nearly allied to Rutaceæ, but their leaves are not dotted. The only plant that gives the order any interest is *Coriaria myrtifolia*, a shrub inhabiting the South of Europe, and employed by dyers for staining black. Its fruit is succulent and said to be poisonous.

CORINTH (Κόρινθος), a city of ancient Greece, the capital of a small but wealthy and powerful district in the Peloponnese. The Corinthian territory was bounded on the north by the Crisæan bay, on the north-east by Megaris, on the east by the Saronic bay, on the south by Argolis, and on the west by the territories of Sicyon. The city was built upon a level to the north of a steep and high mountain called the Acrocorinthus, which served as a citadel, and was included within the wall. (Strabo, Casaub., p. 379.) Corinth had two ports; the nearer, Lechæum, on the Crisæan bay, was connected with the city by two parallel walls, which were partially destroyed by the Lacedæmonians, B.C. 393. (Xenoph. *Hellen.* iv. 4, § 13.) This harbour, which Colonel Leake conceives to have been for the most part artificial, is now nearly filled up; all that remains of it is a lagoon near the supposed site. (Leake's *Morea*, iii., p. 234.) The other port, Cenchreïæ, on the Saronic bay, does not appear to have been connected with the city; it was, however, a more considerable place than Lechæum, and contained several temples. (Pausan. ii. 2.) A few miles to the north of Cenchreïæ was a small bay, called Schœnus. Here was the narrowest part of the isthmus, and a kind of canal called the Diholcus, of which there are still some remains, was carried from the harbour of Schœnus to the eastern extremity of Port Lechæum, and ships were run ashore at one of these points and dragged to the other sea. This work existed in the time of Aristophanes (*Thesmophor.* 645); but in the Peloponnesian War it appears that they had a method of transferring naval operations from the Crisæan to the Saronic bay without dragging their ships across the isthmus. (Thucyd. ii. 93.) A little to the south of the Diholcus was a wall, which was always guarded when any danger threatened the Peloponnese.

The old name of Corinth was Ephyra; and under this name it was one of the seats of the Æolian race. Even in the time of Homer it was called 'the wealthy' (*Iliad*, ii. 570), an epithet which it acquired, according to Thucydides (i. 13), from the commercial spirit of its inhabitants, occasioned by the favourable situation of the town, which threw all the inland carrying trade of Greece into its power; while the difficulty of weathering Cape Maleæ (which was proverbial) made it the emporium of most of the trade between Asia and Italy. (Strabo, p. 378.)

About thirty years after the Dorian invasion of the Peloponnese (i. e. about 1074 B.C.), Ephyra fell into the power of Aletes, the son of Hippotes, a Heracleid, who had slain a soothsayer on the passage from Naupactus, and had been compelled to separate himself and his followers from the army of the Dorians. The city then assumed the name of Corinth, or the Corinth of Jupiter (Müller, *Dorians*, book i. ch. 5, § 8); and the Æolian inhabitants became a subject class, though not altogether deprived of their civic rights. The descendants of Aletes ruled Corinth for five generations with royal power; but at length a rigid oligarchy was substituted for the monarchical form of government, and the power was vested in prytanes chosen annually from the powerful Heracleid clan of the Bacchiadæ. The members of this clan intermarried only with one another, and consequently kept aloof from all immediate intercourse with their fellow-citizens, whom besides they did not treat with much forbearance. In the year 660 B.C. Cypselus, an opulent citizen of Æolian descent, putting himself at the head of the lower orders, overthrew the oligarchy without much difficulty, and assumed the sovereign power. Although he taxed and oppressed the Dorian caste so much that many of them were obliged to emigrate, he seemed to have possessed the full confidence of the great mass of the citizens, and always reigned without a body-guard. His son Periander, who succeeded to his authority, occupies a very prominent place in the ancient history of Greece. He was much more despotic than his predecessor; he had a body-guard of 300 men, and trampled at pleasure upon the rights of his countrymen. His reputation for wisdom (by which we must understand that practical wisdom which consists in governing men) procured him a place among the seven sages of Greece. Upon his death in 579 B.C., his power

devolved to one of his relatives, Psammetichus, the son of Gordias, who after three years was deposed by the Lacedæmonians. The former constitution was then restored, but doubtless much modified, and Corinth remained an oligarchical state till the beginning of the fourth century B.C. In the Peloponnesian War, which was in some measure brought about by them, the Corinthians were staunch supporters of the Lacedæmonians, and the bitterest enemies of Athens. About 394 B.C. a democratical faction endeavoured to upset the aristocracy, and to unite Corinth with Argos, but without any permanent success. (Xenoph. *Hellen.* iv. 4.) Timophanes re-established the monarchical form of government by means of the mercenaries which he commanded; but he was soon removed by assassination. (Aristot. *Polit.* v. 6; Corn. Nepos, *Timol.*, c. i.; Plutarch, *Timol.* iv.) Like the other states of Greece, Corinth felt the influence of the Macedonian power, and was garrisoned by Macedonians under Antigonos, but liberated by Aratus (Pausan. ii. c. 8, § 4.) The Corinthians took the lead in the Achæan confederacy, and were at first allies of the Romans (Pausan. vii. c. 8, § 3); but at last the temptations held out by the wealth of the place, and the pretext furnished by some insults which the Corinthians had offered to the Roman embassy (Strabo, p. 381), led to the destruction and plunder of the town by L. Mummius, in 146 B.C., according to an express decree of the Roman senate. (Liv. *Epit.* lii.) Many works of art were destroyed, but some of the finest pictures and statues were removed to Rome, and contributed to encourage a taste for the fine arts in Italy. (Strabo, p. 381.) Corinth was restored by Julius Cæsar about 100 years after its conquest by Mummius, and peopled with freedmen, who enjoyed the privileges of a Colonia. When Pausanias visited Corinth in the second century of our æra, there were still many fine buildings, and other monuments of the former splendour of the city. (Pausan. ii. c. 1, § 7.) There now remains little but the ruins of a Doric temple, probably the oldest existing specimen of that style.

The colonies of Corinth were very numerous; but, as has been justly remarked by Müller (*Dorians*, i., c. 6, § 7), they were all sent out from Lechæum, and confined to seas west of the isthmus. The most celebrated were Syracuse and Corcyra. Potidæa, in Pallene, however, is an exception to Müller's remark.

Its wealth and the confluence of merchants from all parts favoured everything which ministered to the gratification of the senses; and both architecture and the other fine arts were, according to the testimony of the ancients, successfully cultivated in this wealthy emporium. (Pindar, *Olymp.* xiii., 25—31.)

The Corinthian territory is fertile and well watered. The fountain Peirene, on the Acrocorinthus, was celebrated by the poets (Strabo, p. 379); but in the time of Hadrian, the inhabitants were so little satisfied with the springs in the town, that they induced the emperor to supply them with water from the Stymphalus by means of an aqueduct twenty miles long. The modern name Gortho is merely an abbreviation of the ancient name of the city. (Leake's *Morea*, iii. p. 262.)

According to the fable Bellerophon caught the winged horse, Pegasus, while drinking at the fountain of Peirene. The Pegasus appears on the coins of Corinth and some of its colonies.

CORINTHIAN ORDER. [CIVIL ARCHITECTURE; COLUMN.]

CORINTHIANS, ST. PAUL'S TWO EPISTLES TO THE. The First Epistle of St. Paul to the Gentile and Jewish converts to Christianity in the city of Corinth is generally considered by the commentators and critics to have been written A.D. 57 or 58. Of this opinion are Michaelis, Mill, Whitby, Pearson, Benson, Paley, Adam Clarke, Greswell, &c.; but the date assigned to it by Beausobre, L'Enfant, and Lardner is A.D. 56. The place from which it was written is stated in the concluding postscript to be Philippi, which, as it apparently contradicts the apostle's statement in verse 8, 'I shall remain in *Ephesus* until Pentecost' (ἐπιμενῶ δὲ ἐν Ἐφέσῳ), the latter place is commonly given as the more probable; especially as these postscripts appear to be in other instances erroneous, and without authority. In order to perceive the design of these epistles, it is necessary to observe the following circumstantial facts which gave occasion to the writing of them:—Christianity was first preached at Corinth by St. Paul, who resided there about eighteen months, between A.D. 51 and 53. His successors were Apollos, Aquila, and Sosthenes. But shortly after his departure several other learned and eloquent teachers of Christianity drew away most of the Christian converts from the Gospel doctrine as set forth by St. Paul, and formed them principally into two separate parties, the one contending for the rigid observance of the Jewish ritual, the other for indulgence in some of the idolatrous and lascivious customs of the worship of Venus, to whom a magnificent temple, containing a thousand prostitutes (Strabo, Casaub., 378), was dedicated in the centre of this great commercial city, which bore a proverbial character for luxury and licentiousness. Some writers conjecture that the Judaizing preachers of the Gospel in Corinth were some of the twelve apostles: since Paul asserts that on this question he withstood Peter to the face, and (2 Cor. xi. 22, 23) he speaks of these teachers as Hebrews and ministers of Christ. On being apprised of this condition of the Corinthian church, St. Paul wrote his first epistle, the contents of which may be considered under two general heads: first, the reproof of abuses and corruptions which disgraced the Christian community of Corinth; secondly, the reply to various questions, for the decision of which the Corinthians had appealed to the judgment of their apostle. After commencing with the usual salutation, he proceeds therefore to rebuke their schisms and assumption of knowledge and wisdom; exhorting them to become united to himself, as having a prior claim to their respect and attention (c. i. to iv.). He next reproves them for not having delivered unto Satan one who had his father's wife (c. v.); for not suffering themselves to be defrauded rather than go to law; and especially for their indulgence in fornication (c. vi.). Then follow answers to the questions, in which instructions are given concerning marriage, celibacy of virgins and widows, the eating of idolatrous sacrifices, the exercise of supernatural gifts, the proprieties to be observed by public preachers, and the forbidding women to address congregations (c. viii. to xiv.). A censure is passed upon the profane observance of the Lord's Supper, for in eating it, each before another took his own supper, so that while one was hungry another was drunk (ἐκαστος γὰρ τὸ ἴδιον δεῖπνον προλαμβάνει ἐν τῷ φαγεῖν καὶ ὃς μὲν πεινᾷ, ὃς δὲ μεθύει) c. xi. 21. From c. xv. 12, it appears that it was taught among the Christians of Corinth that there is no resurrection of the dead. St. Paul thence takes occasion to expatiate upon the subject to the end of this chapter, which forms the most imposing part of the Church of England Burial Service. The epistle closes with an exhortation to the Corinthians to secure the collection of money for the necessitous saints in Judæa, both hearers and preachers, which is several times enforced with various arguments, especially in c. ix. and xvi., and in c. viii. and ix. of the second epistle, of which we now come to speak. It is generally agreed that it was written A.D. 58, about a year after the first, and from Philippi, as the postscript asserts. The main purpose of St. Paul in this epistle was to repel the imputations which it appears his first epistle had induced the opponent teachers to make, both as to his doctrines, authority, and personal appearance. It is in fact an apologetic oration, in which the apostle enlarges on his spiritual office, power, and qualifications; and speaks of his supernatural revelations, as far exceeding the pretensions of his rivals at Corinth, whom he designates 'false apostles, deceitful workers, and ministers of Satan,' xi. 13. He explains at length the cause of his not having visited the

Corinthians as he promised, declares his great success in preaching, mentions his numerous sufferings and disasters incurred for the sake of the faithful, enforces the necessity of completing the contribution for the saints, and concludes with a farewell salutation.

The great rhetorical merits of this address are critically discussed in the 'Disputatio Inauguralis de alterâ Pauli ad Corinthios Epistolâ,' by M. Royards, 8vo., 1818. All the passages in the fathers of the first three centuries which contain any citation from, or allusion to, these two epistles of St. Paul, are collected in the 2nd vol. of Dr. Lardner's *Credibility*. The words in the first epistle, "Ἐγραψα ὑμῖν ἐν τῇ ἐπιστολῇ (c. v. 9), have been the subject of great controversy, as implying that another epistle, not now extant, was written before the one which is called the first. A long list of the critics and divines who have given opinions about it, may be found in Horne's *Introduc.*, vol. iv. p. 353. Numerous critical particulars may be found in the following works:—Michaelis, *Introduction to the New Testament*, by Bishop Marsh, vol. iv. p. 42-74; Eichhorn, *Einleitung in das Neue Test.*, vol. iii. pp. 91-201; Macknight on the *Epistles*; Horne's *Introduction*, vol. iv., pp. 349-357, and 603; Greswell, *Harmony of Gospels*, vol. ii., pp. 33-38; Paley's *Horæ Paulinæ*, pp. 66-98; *Critical Commentaries* by Piscator, Rollock, Schlater, and others, are enumerated in Watts' *Bibliotheca*, where a very copious list is given of sermons on texts from these epistles, both which were first printed separately from the Testament by Melancthon at Wittenberg in 1521.

CORIOLANUS, CNÆUS MARCIUS, the hero of an antient Roman legend, belonging to the latter half of the third century of the city. Dionysius calls him Caius, but Dion and most of the MSS. of Livy are in favour of Cnæus. (Niebuhr's *Hist. of Rome*, vol. ii., p. 234, *Eng. Transl.*) The surname Coriolanus was supposed, in later times, to have been derived from his conquest of Corioli, but it probably arose in the same way as a multitude of other Roman surnames, such as Sabinus, Auruncus, Viscellius, &c., which only indicate the origin of the houses that bore them. A similar connexion might no doubt be satisfactorily traced in many more cases if the names of the towns remained to justify our conclusions. (Niebuhr, vol. ii., p. 242.) The story of Coriolanus, as given by the Roman historians, is so completely poetical in its form, and so rhetorical in its details, that Niebuhr (p. 242) is of opinion that almost the whole of it must be excluded from history. The tale however runs as follows:—

Coriolanus was in the Roman camp when the consul Cominius was laying siege to Corioli. The besieged making a vigorous sally, succeeded in driving back the Romans to their camp; but Coriolanus immediately rallied them, rushed through the gates, and took the place. Meanwhile the Antiates had come to relieve the town, and were on the point of engaging with the consul's army, when Coriolanus commenced the battle, and soon completely defeated them. From this time he was greatly admired for his warlike abilities, but his haughty demeanour gave considerable offence to the commonalty. Not long afterwards, his implacable anger was excited by being refused the consulship; and when, on occasion of a severe famine in the city, corn was at last brought from Sicily (some purchased and some given by a Greek prince), and a debate arose whether it should be given gratis or sold to the plebs, Coriolanus strenuously advised that it should be sold. The people in their fury would have torn him to pieces had not the tribunes summoned him to take his trial. He was banished by a majority of the tribes, and retired to Antium, the chief town of the Volsci, where the king, Attius Tullus, received him with great hospitality. Coriolanus promised the Volsci his aid in their war against Rome, and they forthwith granted him the highest civil honours, and appointed him their general. He attacked and took many towns; among others Circeii, Satricum, Longula, and Lavinium. At last he directed his march to Rome itself, and pitched his camp only a few miles from the city, where he dictated the terms at which the Romans might purchase a cessation of hostilities. Among other things he demanded that the land taken from the Volsci should be restored, that the colonies settled there should be recalled, and that the whole people should be received as allies and citizens with equal rights; and that all those who had enlisted themselves under his banners should be recalled as well as himself. Coriolanus allowed them two terms, one of thirty and the

other of three days, for making up their minds. After thirty days had expired, a deputation of four leading senators came before his tribunal, but were repulsed with threats if they should again offer anything but unreserved submission.

On the second day the whole body of priests and augurs came in their official garb and implored him, but in vain. On the third and last day which he had allowed them he intended to lead his army against the city, but another expedient was tried, and succeeded. The noblest matrons of the city, led by Veturia, the mother of Coriolanus, and his wife Volumnia, who held her little children by the hand, came to his tent. Their lamentations at last prevailed on his almost unbending resolution, and, addressing his mother, he said with a flood of tears, 'take then thy country instead of me, since this is thy choice.' The embassy departed; and dismissing his forces, he returned and lived among the Volsci to a great age. According to another account he was murdered by some of the Volsci, who were indignant at his withdrawing from the attack.

After his death however the Roman women were mourning for him as they had done for some former heroes. The public gratitude for the patriotic services of Volumnia were acknowledged by a temple, which was erected to Female Fortune. Shakspeare has founded his play of 'Coriolanus' on certain parts of the legend.

(Dionysius Halicarnassensis, viii.; Plutarch, *Life of Coriolanus*; Livius ii., 33—40; Florus i., 11: Niebuhr's *Hist. of Rome*, vol. ii., pp. 234—243.)

CORK, botanically considered, is the soft elastic bark of a kind of oak inhabiting Spain and Portugal. [*QUERCUS*.] The bark of all trees consists of a parenchymatous or soft cellular substance, and of a harder ligneous tubular tissue: in most species the latter is most abundant; in the cork the former constitutes the mass of the bark, and hence its elasticity and the facility with which it is cut in all directions. When however it is first generated, the bark of the cork-tree is far less elastic than it becomes subsequently; which is owing to its consisting in the first instance of a large proportion of woody matter. When the latter is once formed, which takes place in the first year of its growth, it never increases, however long the bark may remain in a living state; but the parenchymatous substance will go on growing as long as the bark is alive, a provision of nature connected with the annual increase in diameter of wood and the necessity of the bark giving way to the pressure from within. If the growth of the parenchyma is prolonged and rapid, a corky substance is the necessary consequence, as in certain kinds of elms, the common oak itself, and many other trees; but it does not occur in any European tree in such excess as in the cork. As soon as the bark dies, it of course ceases to grow, and then, not distending as it is pressed upon from within, it falls off in flakes which correspond to the layers that are formed annually. These flakes are the layers of cork which the Spaniards collect under the name of the outer bark, while the inner living bark is or rather should be spared. We are told, however, by Captain S. Cook, that recently the Spaniards have committed the inconceivable absurdity of stripping off the inner bark also, although it is of no value except for tanning, and although its removal of course destroys the trees. The same intelligent observer states that the cork-tree occurs in Spain throughout the whole extent of the *Tierra Caliente*, but is most abundant in Catalonia and Valencia, whence the principal exports have been made. Cork appears to be a corruption of the Latin word *cortex*.

CORK TRADE. [*BARK*.]

CORK, a maritime county of the province of Munster in Ireland, bounded on the north by the counties of Limerick and Tipperary, on the east by the county of Waterford, on the south by the Atlantic Ocean, and on the west by the county of Kerry. It lies between $51^{\circ} 27'$ and $52^{\circ} 13'$ N. lat., nearly under the same parallels with South Wales, and is by much the largest county in Ireland. Its greatest length from Youghall on the east to the mouth of the Kenmare river on the west, is 93 Irish or 110 English miles; and its greatest breadth from the Old Head of Kinsale upon the south to Charleville on the north, is 44 Irish or 56 English miles.* The area is estimated at 2654½ square statute miles, or 1,698,882 English acres; but this estimate is not to be depended on for accuracy: the

indentations of the coast from Youghall to Kenmare give a coast-line of about 200 miles. Population in 1821, 629,786; in 1831, 703,716.

The chief mountain groups, which with bogs and unprofitable lands occupy upwards of two-ninths of the entire surface, may be considered as offsets of the main ridge which separates Cork from Kerry. This ridge, the southern extremity of which separates Bantry Bay from the river of Kenmare, runs N.N.E. and S.S.W., and on the side towards Cork sends off numerous lateral elevations. Of these the two chief are the ranges north and south of the valley of the Lee, which river divides the county into two nearly equal portions. The northern range, which is by much the more extensive, consists of the almost continuous groups of the Muskerry, Boggra, and Nagles mountains, and stretches in a uniform direction from the Kerry boundary on one side of the county, to within a few miles of the borders of Waterford on the other. The Shehy group, which forms the southern boundary of the basin of the Lee, runs a much shorter distance from the main ridge; but the upland country of Kinalmeaky, into which it subsides, prolongs the elevation in a line parallel to the direction of the Boggra range across the entire extent of the county, from Dunmanway on the west to the high grounds above Cork and Passage on the east. North and south of this central valley are the districts which form the basins of the Blackwater and the Bandon; the former included between the mountains of Limerick and Tipperary, and the Boggra groups; and the latter between the Shehy range and those elevations which rise southward towards the sea-coast. These three principal valleys are nearly symmetrically situated, and their respective rivers run very nearly parallel to one another, their general course being from west to east: all have their rise among the eastern declivities of the Kerry ridge, and each, as it approaches the termination of its course, takes a southward direction for some miles before entering the sea. In like manner each is naturally navigable throughout this latter portion of its course, as the Blackwater from Youghall at its mouth to Cappelquin; the Lee from the sea to Cork; and the Bandon from Kinsale at its mouth to Inishonan. The Blackwater is by much the largest river of the three, and drains a proportionately greater extent of country. The bogs and waste lands lie among the mountain groups described; the remainder of the county is well tilled and productive, particularly along the banks of the rivers enumerated, and in the districts included between their embouchures.

Beginning from the east, the harbour of Youghall has a tolerable anchorage in six fathoms water without the bar, where vessels may wait the tide, which gives twenty feet of water on the bar at neaps. Three leagues south is a good anchorage and fishing ground, in five to twelve fathoms water at Ring Point. From this the coast is rocky, with the exception of the extensive strand of Ballycotton Bay, to the entrance of Cork harbour four leagues farther west. This harbour is so commodious, says Smith, that it will admit the largest vessels at any time of the tide without striking sail, and has a land-locked anchorage in ten fathoms water in some places, and in seven fathoms' water within a cable's length of the shore. On the shoalest part of the bar are thirty feet water at ebb-tide. From this westward to Kinsale harbour the coast is rocky and dangerous. The harbour of Kinsale has thirty feet of water on the bar, and anchorage within in seven fathoms; but it is not so capacious as that of Cork. There is also good anchorage in any depth of water on both sides of the promontory to the west called the Old Head of Kinsale. The bay of Courtmasherry, next west, is fit for vessels of 200 tons, but exposed. Clogh-nakilty harbour is encumbered with a bar, on which are only two fathoms' water at full sea, and vessels embayed here are in considerable danger. The harbour of Glandore has fourteen to thirty feet of water in its channel, and a land-locked anchorage. Castlehaven Creek has safe anchorage in fourteen feet; and Baltimore Bay pretty good in six fathoms. Baltimore is situated on the eastern side of an extensive bay, bounded on the east by Cape Clear Island, and on the west by Mizen Head: it contains the several minor bays of Baltimore, Roaring Water, Crookhaven and Inisberkin, in all of which merchant vessels may find anchorage. West from Mizen Head the bay of Dunmanus runs inland twelve miles in a north-east direction, with ten to thirty fathoms of water throughout, and no bar; but it is little frequented, in consequence of the contiguity of Bantry Bay, from which it is separated by the narrow mountainous

* These measurements are given from Smith. Doctor Beaufort makes the length 78 Irish or 99 English miles; and the breadth 56 Irish or 71½ English miles.

promontory terminating in Minterbana or Sheep's Head. Bantry Bay is forty fathoms deep at the mouth, twenty-six miles long, and from three to five miles broad. Bear Island at its entrance protects it from the south-westerly swell, and affords the land-locked anchorage of Bearhaven in ten to sixteen fathoms' water, for an unlimited number of vessels. Further up, Whiddy Island incloses the minor bays of Bantry and Glengariff, the latter much celebrated for the magnificence of its scenery: it is calculated that all the shipping of Europe could ride secure in this noble harbour. Bearhaven has been proposed as a station for packet-ships to North America, in connexion with the projected south-western line of rail-road from Dublin.

Facilities for water-carriage are confined to the coast: the inland navigation of the Bandon is very inconsiderable; that portion of the Blackwater which is navigable lies in the county of Waterford; and the traffic between Cork and the sea is more a harbour than a river navigation. It has been proposed to render the Bandon navigable, from Dunmanway, near its source, to Inishonan; also the Blackwater, from Mallow to Cappoquin; but neither design has been practically attempted. The only lakes in the county are two small but very picturesque sheets of water, near the source of the Lee, and some pools on the coast.

The road to Dublin, carried over the eastern flank of the Nagles mountains by Rathcormack, unites the valleys of the Lee and the Blackwater from Cork to Fermoy. The road from Cork to Mallow, carried over the western flank of the same range, forms another line of communication between these valleys, and is used as the post-line to Limerick. Westward from Mallow to Millstreet, a distance of nearly eighteen miles, the range of the Boggra mountains formed an impassable barrier, until, in 1823, permission was obtained from government to make a road through the centre of this group at an expense of about 10,000*l.*, one-half to be levied by county presentments, and the other half to be defrayed out of the Consolidated Fund. This road has now been open for several years, and saves the inhabitants of the valley of the Blackwater a distance of fully twenty miles Irish on every journey to and from the Cork market. It also supplies an easy means of transit for fuel to the low countries, both north and south. Before this road was opened, the only means of procuring fuel from the upland bogs was on the backs of small horses, or of men and women. Other new roads have been made at the public expense within the county in the neighbourhoods of Cloghna-killy, Bandon, Skibbereen and Courtmasherry. Prior to the year 1829, a great part of the north-western district of the county was almost inaccessible. This district formed part of a tract of 970 square miles, comprised between the Shannon and the Blackwater, which up to the year 1822 had contained no road passable for horsemen in wet weather. 'The entire district must have remained neglected by the hand of civilization from the period at which its antient proprietors, the later Earls of Desmond, had been dispossessed of it in the reign of Elizabeth.' (*Report on the Crown Lands of Poble O'Keefe*, 22 March, 1831.) The whole district contained but two resident landed proprietors, whose houses were distant $38\frac{1}{2}$ miles from one another. The inhabitants were poor and ignorant, and the inaccessible nature of the country made it the asylum of smugglers and outlaws. Through the northern parts of this district seventy-five miles of good road were made by government in the years 1823—9. The consequences were an immediate increase of industry and produce, and a very rapid improvement in morals and intelligence. Still there remained the southern portion of the district, comprising 128,000 acres in the north-west of Cork through which no road had yet been carried. To open up this tract, a road was projected in 1829, from Castle Island in the county of Kerry eastward, so as to meet the lately-constructed Boggra road at its terminus on the Blackwater, by which a communication would be opened between Castle Island and Mallow, which would shorten the distance from the former town to Cork by twenty-two miles. A second line, connecting this road with the post-line from Cork to Killarney, was also projected, by means of which Killarney would have a direct communication through Mallow with Waterford. About the same time, a tract of 9000 acres in the heart of the unopened district escheated to the crown. Possession being obtained of 5000 acres, the attention of government was, in January, 1831, directed to the best means of improving the wretched tenantry found occupying the estate. It was found that the projected road from Castle Island would cross the head

of the Blackwater within the estate, and that the vicinity of the ridge would be an eligible site for a village. The village of King William's Town has accordingly been built under the superintendence of Mr. Griffith: it consists of a carman's inn, a model farm-house, a few suitable houses for shopkeepers, artisans, and labourers, and a large school-house. The estate, which, on its reversion, 'was saturated with water, and covered with thick matted beds of moss, rushes, and heath, the growth of ages,' unfenced, unmanured, and inaccessible, is now to a great extent drained and divided into well-fenced farms for grazing and tillage, to which the newly-opened road affords a ready supply of lime for manure, as well as a convenient means for carriage of produce to market. The condition of the tenantry is rapidly improving, and there is every prospect of complete success attending these benevolent exertions of the government. Up to the 12th February, 1833, the amount granted by the Treasury for the improvement of these estates was 6500*l.* The estimate for the Castle Island and Mallow, and Killarney and Mallow roads, was 23,812*l.* 1*s.* 2*d.*: of this amount government defrayed 17,000*l.* A sum has also been advanced by the present Board of Works, for the construction of a new road from Glengariff to Killarney, across the ridge of the Bantry mountains. The remaining roads of the county are under the control of the Grand Jury. A rail-road has been projected from Cork to Passage, where there is a much frequented ferry between the mainland and Cove.

The climate is moist but genial in the south and east. The annual average of rain at Cork for the eleven years preceding 1748 was 38.26 inches. The wind blows between south and north-west for more than three-fourths of the year.

From the east of Limerick and south of Tipperary the limestone field extends towards the Blackwater, which it skirts for a part of its course on both sides between Mallow and Fermoy, until overlaid by the shale and sandstone beds of the Munster coal district, which occupy the whole extent of the uncultivated country described above. The limestone again occurs in stripes along the valley of the Lee, and occupies the basin on which the city of Cork is built, from which it stretches eastward in two parallel belts across the low sandstone country to the banks of the Blackwater. The Boggra and Nagles ranges consist of sandstone, which rock prevails throughout the district watered by the Lee. South of the Lee, the slate-clay, on which the sandstone rests, crops out in longitudinal strata that have a uniform direction from N.N.E. to S.S.W. and a prevalent dip to the S.E. This rock, varying from the hardest grit to clayey rubble, constitutes the whole of the southern portion of the county from the mouth of the Lee to the mountains of Bear and Bantry, where its elevations attain an altitude of above 2500 feet. Among these are some peaks of quartz formation, of which the most remarkable is Sugarloaf-hill, which rises over the bay of Glengariff. The veins, which occupy many of the fissures of this rock, abound in ores of iron, copper, lead, and manganese.

The soil of the coal district on the north-west is cold, stiff, and moory. In the north-east, where limestone abounds, it is warm and friable. Along the valley of the Lee is a red, crumbly, and heavy soil, which requires considerable manuring with lime or sea sand. Throughout the schistose formations, south of the valley of the Lee, the earth is generally dry and sandy, requiring much dung to make it bear corn. Marl, fullers' earth, and clay for brick kilns and potteries, are found in considerable abundance. The best cultivated parts of the county are the eastern portions of the basins of the Blackwater and the Lee, and the low district included between their embouchures. The system of agriculture in these districts is good. There is a large resident proprietary, and every evidence of wealth and comfort. The remainder of the county, except in the neighbourhood of towns and gentlemen's demesnes, presents a strong contrast. The extreme west is barren from one extremity of the boundary line to the other. The transverse ranges of moorland and bog are totally unreclaimed, and the population on their borders are poor and ignorant. The county is, nevertheless, improving: this improvement is mainly attributable to the construction of roads by the government.

The county comprehends 22 baronies, one county of a city and sundry corporate districts. Duhallow, Orrery and Killmore, Fermoy, Condons and Clongibbons, occupy the district of the Blackwater, enumerating from west to east. West Muskerry, East Muskerry, Barretts, Barrymore, Kilnatalloon, and Imokilly, occupy the district of the Lee in the

same order. Bear, Bantry, West Carberry, west and east divisions, East Carberry, west and east divisions; Ibaune and Barryroe, Courcies, Kinnalmeaky, Kinnalea, Kinsale, and Kerrycurrihy, occupy the remainder of the county in like manner on the south.

To these are to be added the county of the city of Cork, and the liberties of Youghall and Mallow. Other corporate towns have liberties, but not extensive enough to come under this division.

Cork county lies within the dioceses of Cork, Cloyne, Ross, and, to a small extent, in Ardfer and Aghadoe, and contained, in 1792, 269 parishes and 105 churches.

The county was formerly represented by 26 members in the Irish parliament, of whom two were returned by the county, and a like number by the city of Cork and each of the following boroughs: Kinsale, Youghall, Bandon, Mallow, Doneraile, Rathcormack, Middleton, Charleville, Castlemartyr, Baltimore and Cloghnakilty. These, with the exception of Doneraile and Rathcormack, still possess charters of incorporation, and are governed by corporate authorities.

With the exception of Cork, Bandon, and Youghall, these boroughs, at the time of the Union, lost their privilege of representation. The representation in the imperial parliament is now confined to two members for the county, two for the city of Cork, one for Bandon, and one for Youghall. The total amount of Union compensations was 150,000*l.* The other places of importance in the county are Bantry (population 4275); Cove (pop. 6966); Dunmanway (pop. 2738); Skibbereen (pop. 4430); Mitchelstown (pop. 3545); Fermoy (pop. 2557); Kanturk (pop. 1349); Newmarket (pop. 1437); Cloyne (pop. 2227); Millstreet (pop. 1935); Macroom (pop. 2058); Buttevant (pop. 1536).

The principal copper-mines in Ireland are situated at Allahies, about ten miles west of Skibbereen. They were first worked in 1814, and now give employment to about 1500 people. The ore contains from 55 to 65 per cent. of copper. In the same neighbourhood the ashes of a bog impregnated with copper yielded a considerable return until burned out. A deposit of manganese is worked with good

profit on the same coast. Veins of sulphate of barytes occur in the neighbourhood of Bantry, and specimens of asbestos have been procured at Bearhaven. The coal of the district of the Blackwater is anthracite or blind coal. The chief workings are at Clonbannon and Dromagh, near the crown estate, where there is a good home consumption at the distilleries in the neighbourhood. The district is, however, still too inaccessible to encourage extensive operations. There is abundance of iron ore, if coal could be had for smelting. While the county was well wooded iron works were carried on to a considerable extent. The East India Company had iron works on the Bandon in 1612, and paid 7000*l.* for a tract of wood for their furnaces. About the year 1632, the Earl of Cork had in his various bloomeries 1000 tons of bar and 20,000 tons of pig iron; besides 200 tons drawn out and faggotted into rods. Bar-iron was at that time worth 18*l.* per ton.

The export of produce is the principal trade: 30,000 firkins of butter, value about 50,000*l.*, are annually brought to market from the western district; but a considerable part of this is supplied from the borders of Kerry and Limerick. The following abstract exhibits the quantities of grain sold at some of the principal market towns in the year 1835:—

	Barrels of Wheat of 20 stone.	Barrels of Barley of 16 stone.	Barrels of Oats of 14 stone.
Cork . . .	82,838	64,294	130,826
Bantry . . .	8,453	200	3,421
Macroom . .	3,263	—	12,000
Dunmanway .	9,741	578	—
Fermoy . . .	56,330	12,360	34,384
Mitchelstown	—	1,250	3,429
Kanturk . . .	8,900	100	550
Kinsale . . .	—	1,320	—
Middleton . .	12,493	30,225	7,306

No returns from Skibbereen, Cloghnakilty, Bandon, Mallow, Charleville, and Youghall.

The linen and woollen manufactures at one time flourished in several towns of this county; but trade in these branches has for many years back been languishing.

TABLE OF POPULATION.

Date.	How ascertained.	No of houses.	Families.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	Families not in- cluded in pre- ceding classes.	Males.	Females.	Total.

1831	Under Act 1 Wm. IV., c. 19	106,893	118,356	81,623	16,531	20,212	348,402	355,314	703,716

Cork is the assize town. The county gaol, about three-quarters of a mile from the city, is considered the most perfect institution of the kind in Ireland. There are seventeen bridewells in the other principal towns. Quarter sessions are held twice a year at Bandon, and once at Skibbereen and Bantry respectively. The number of the constabulary in the county of Cork, on the 1st January, 1836, was 15 chief constables, 85 constables, 426 subconstables, and 17 horse do.: total expence for 1835, 19,807*l.* 15*s.* 5*d.*, of which 9334*l.* 12*s.* was chargeable against the county.

Before the coming of the English, Cork was a separate kingdom, of which the princes were the Mac-Carthys. The antient kingdom of Cork included, besides the present county, a considerable tract in Kerry and Limerick. It was divided into Desmond, or South Munster, on the west; Muskerry, a part of Ormond, or West Munster, on the north-east, and Carbery on the south-west. In all these districts the Mac-Carthys were the most powerful. The native families next in importance were, in Desmond, the O'Sullivans; in Carbery, the O'Donovans, and O'Driscolls; and in Muskerry, the O'Learys on the south-west; the O'Lehans (from whom Castle Lyons) on the south-east, the Mac-Donohgs on the north-west, and the O'Keefes on the north-east. In 1172 Dermot MacCarthy, king of Cork, swore fealty to King Henry II., but he broke his engagements ten years afterwards by falling on the English under Raymond Le Gross by land, while his ally, Gilbert, son of Targesius, with a fleet of 35 sail from Cork, attacked Earl Strongbow by sea at Dungarvan. His kingdom, thus

forfeited, was bestowed by King Henry, in 1177, on Robert Fitz-Stephen and Milo de Cogan. The city of Cork with the cantred adjoining was reserved to the king. Of the thirty-one cantreds conveyed by the king's grant, Cogan and Fitz-Stephen obtained possession of seven, lying near the city, which they divided, the three eastward cantreds falling to Fitz-Stephen's lot and the four westward to Cogan's. On the remaining 24 cantreds they levied rents from the native princes. Fitz-Stephen dying without issue, his grant went chiefly to the families of Barry and Roche. Cogan's share falling ultimately to coheirresses, was divided among Robert de Carew, Patrick de Courcey, and Maurice Fitz Thomas (Fitz John Fitz Thomas Fitz-Gerald), who was created earl of Desmond in 1329. The estates of this last family were further increased by large grants from Robert Fitz-Geoffrey Cogan, who had intruded on the portions of the Carews and De Courceys in 1438; so that the eighth earl of Desmond found himself in possession of almost the entire kingdom of Cork; but assuming to himself the right of levying separate exactions on the king's subjects, after the Irish manner, was attainted of treason and beheaded at Drogheda, 15th February, 1467. Nevertheless his estates passed, and in the person of his descendant Gerald, the fifteenth and last earl, had grown to an amount unexampled in the history of private property in Ireland. They extended upwards of 150 miles throughout the counties of Waterford, Cork, Kerry, and Limerick, and comprehended an area of 574,628 acres, according to the rough estimate of these times, the calculation seeming to have reference

only to profitable land. Before the Desmond possessions had grown to this extent, the entire county of Cork had become Irish in language and habit.

Most of the old nobility of English descent had taken part with the defeated Yorkists in the latter end of the preceding century, and the Irish, on these noblemen leaving their estates to assist Simnel and Warbeck, had returned from their fortresses and over-run the new plantations. The families of Carew, Barnwell, De Courcey, Balram, Mandeville, and Arundel, were thus expelled from the country, while their places were occupied by the descendants of the Irish clans above mentioned. The reformation had made little progress in a country so indisposed for the reception of anything English, and on the breaking out of the northern rebellion in Elizabeth's time, Cork was considered the fittest place for an attempt in favour of the Catholic cause under the auspices of King Philip of Spain, to whom the country had been offered by Pope Gregory XIII. The principal Irish agent in bringing about the invasion was James Fitz-Maurice, the brother of the 15th Earl. On his landing with some Italian troops, accompanied by Saunders, the pope's legate, 1st July, 1578, he was joined by his brother Sir John of Desmond, and by James Fitz-Gerald, the earl's brother. The earl himself made some show of attacking them at first, and during the early part of the war which ensued took no active part against the queen; but having refused to yield up his castles and come in on the summons of the Lord Justice Sir William Pelham, he was, with all his family, proclaimed traitor, 1st November 1579. On this he set up his standard at Ballyhowra in Cork, declared for the Catholic cause, and seized on Youghall. The war which ensued was predatory and sanguinary on both sides, and lasted till November 1583, when the unfortunate earl, after losing all his castles, and being driven to lurk for months together in the woods, was put to death by one Kelly, who found him in a wretched cabin, where he was hiding, in the county of Kerry. The forfeited estates were divided into seigniories, and granted to English adventurers. Upwards of 20,000 acres fell to Sir Walter Raleigh, who had been active in the suppression of the rebellion. The other grantees in Cork were:—Sir Warham St. Leger, 6000 acres; Hugh Cuffe, Esq., 6000; Sir Thomas Norris, 6000; Arthur Robins, Esq., 18,000; Sir Arthur Hyde, 5574; Fane Beecher, Esq., 12,000; Hugh Worth, Esq., 12,000; Thomas Say, Esq., 5775; Arthur Hyde, Esq., 11,766; Edmond Spenser, Esq., 3028; Sir Richard Beacon (in Cork and Waterford), 6000.

On the 7th December, 1602, Sir Walter Raleigh conveyed his proportion in Cork and Waterford for a small sum to Sir Richard Boyle, afterwards earl of Cork. A large part of Beecher's seigniority was purchased by Sir Richard about the same time. On the latter he built the fortified town of Bandon, which he peopled with English settlers; and so stocked and planted his whole estate with British, that in 1611 his tenants on Raleigh's portion mustered 550 foot and 80 horsemen, and in 1622 on Beecher's portion, 564 foot and 66 horse, the horse being mostly gentlemen and freeholders. Before this settlement the county had been much distracted by the wars consequent on the landing of the Spaniards, 23rd September, 1601, in support of Hugh earl of Tyrone, then in rebellion in Ulster. Tyrone had shortly before this raised James Fitz Thomas, the nephew of the late earl, to the title. He was known as the *Sugaun* or Straw Earl; and in his rebellion was joined by great numbers of the native Irish under Florence Mac Carthy, who had also been created Mac Carthy More by Tyrone, in place of Daniel, lately deposed from the chieftainship by the same authority. This war was quieted just before the arrival of the Spaniards by the capture of the two leaders. Mac Carthy was executed, and the Sugaun Earl, being imprisoned in the tower of London, died there in 1608.

By the latter end of December, 1601, the rebellion was at an end; numbers of the chief rebels had fled to Spain, and after the exhibition of some discontents on the proclamation of King James, April, 1603, the country settled into tranquillity. Sir Richard Boyle now began to regulate the various boroughs which he had enlarged or founded on his estates, procuring charters for Youghall, Bandon, Cloghnakilty, and Baltimore. His family preserving the same policy afterwards, raised Middleton, Doneraile, Castlemartyr, and Charleville, to the rank of corporate towns; so that the whole representation of the county ultimately rested in the

various branches of the Boyle family. The services of the British tenantry planted by this enterprising nobleman were soon called for, on the breaking out of the rebellion of 1641. The good conduct of the various bodies of this militia, under the command of lords Broghill, Kinalmeaky, Dungarvan, and Shannon, lord Cork's sons, materially conduced to the pacification of Munster. Throughout the war the English were generally successful in retaining the walled towns and castles. Lord Castlehaven had some successes on the other side in 1645, taking Mitchelstown, Liscarrol, Mallow, Doneraile, and various castles north of the Blackwater in this county; but these places did not long remain in his hands. The chief battles fought in Cork during this war were at Liscarrol, 3rd September, 1642, where Lord Inchiquin, accompanied by the sons of the earl of Cork, with a force of 2000 foot and 400 horse, totally defeated the Irish under general Barry, who is said to have had 7000 foot and 500 horse; and at Knockinoss, near Mallow, 13th November, 1647, where the same general, with 4000 foot and 1200 horse, routed the Irish, being 8500 strong, under the command of lord Taaffe and Sir Alexander (son of the famous Colkitto) Macdonnell. Four thousand Irish fell on the field of battle; and for his good conduct on the occasion lord Inchiquin was voted a present of 1000*l.* by the parliament. About 1657 lord Broghill began to agitate the question of the restoration, which event he was mainly instrumental in bringing about in 1660. He was now created lord Orrery, and advanced to the presidency of Munster, the affairs of which he managed with great prudence till 1668, when, falling into disfavour at court, he was deprived of his commission. In the same year he successfully defended himself on an impeachment before the Commons; and being restored to the favour of the king, returned to his native country, where he died in 1679. The forfeitures consequent on this rebellion affected chiefly the estates of lords Roche and Muskerry.

During the war of the Revolution, Cork was again the theatre of a desultory but sanguinary series of conflicts between the native Irish of the rural districts and the militia of British descent.

The chief sufferers by the forfeitures consequent on the war of the Revolution were Donogh lord Clancarty, Sir Richard Nagle, colonel Barrett, and the viscount Kenmare. The extent of land forfeited was 244,320 acres, valued at 32,133*l.* 12*s.* 6*d.* per annum; or 417,737*l.* 2*s.* 6*d.* at the then rate of purchase. This was by much the most extensive forfeiture in any one county. Among the numerous minor proprietors who suffered confiscation, the name of Hugolin Spencer, a descendant of the poet, occurs.

The antiquities are chiefly military, and comprise some of the finest buildings of the kind in Ireland. The castle of Kanturk, built by Mac Donogh, prince of Duhallow, is a square of 120 feet by 80, and about 70 feet in height. Lohort castle, built in king John's reign, is a massive keep, 80 feet high. Liscarrol castle, of the same date, is an oblong of 120 by 240 feet. Blarney castle, built by Cormack Mac Carthy in 1449, is still a fine ruin, though only one-fourth of the original building is now standing: the walls are 18 feet thick. The other castles still standing in the county are very numerous, and of great historical interest.

The dioceses of Cork, Cloyne, and Ross, with which the county is nearly co-extensive, rank respectively 19th, 25th, and 21st, among the 32 Irish dioceses in point of education. The average of educated persons in the three dioceses is 6.8 per cent.

The amount of direct taxation levied by grand jury presentment on this county in 1810 was 66,849*l.* 0*s.* 7*d.*, and in 1829, 72,969*l.* 2*s.* 7*d.*; being on an average of the twenty years included, 65,570*l.* 7*s.* 11*d.* On a valuation made by order of the grand jury in 1829-30, the rent value has been estimated at 1,135,923*l.* 16*s.* 2*d.* per annum. (*Smith's History of the County of Cork*, Dublin, 1750, and *Cork*, 1825; *Townsend's Statistical Survey of Cork*, Cork, 1815; *Cox's History of Ireland*; *Parliamentary Reports and Papers*.)

CORK, a bishop's see in the archdiocese of Cashel, in Ireland. The chapter consists of a dean, chanter, chancellor, treasurer, archdeacon, and twelve prebendaries. This diocese stretches across the central district of the county of Cork, and embraces the county of the city. It extends in length, from east to west, 74 miles, and from north to south 16. It contains 83 parishes, constituting 65 benefices. In 1792 the numbers were, 94 parishes, 49 benefices, and 41 churches. In 1834 the numbers were, churches of the esta-

blishment, 58; other places of worship in connexion therewith, 26; Roman Catholic ditto, 73; Presbyterian ditto, 3; other Protestant dissenting ditto, 16. In the latter year the gross population of the diocese was 340,594; of whom there were 35,229 members of the Established Church, 303,984 Roman Catholics, 510 Presbyterians, and 871 other Protestant Dissenters; being in the proportion of 1 Protestant of whatever denomination to 8½ Roman Catholics nearly. There were at the same time in this diocese 346 schools, educating 24,448 young persons, being in the proportion of 7²⁸/₁₀₀ of the entire population under daily instruction; in which respect Cork stands 19th among the 32 dioceses of Ireland, and is on a par with Dublin. Of the above schools 20 were, in 1834, in connexion with the Board of National Education.

The foundation of this see is ascribed to St. Barr, about the beginning of the seventh century. It became united to Cloyne, about 1464, and so continued till 1586, when, together with Cloyne, it was annexed to the diocese of Ross, and so continued till 1678, when these dioceses were again divided, Cork and Ross going together, and Cloyne separately. By the 3rd and 4th Wm. IV., c. 37, these sees are to be again united, on the united see of Cork and Ross becoming vacant. (*Beaufort's Memoirs of an Ecclesiastical Map of Ireland.*)

CORK, a city, the assize town of the county of Cork, in the province of Munster, in Ireland, situated in the county of the city of Cork, on both sides of the river Lee, four miles from its entrance into Cork harbour. 51° 54' N. lat., 8° 30' W. long. Distant from Dublin 124 Irish, or 158 English miles.

The county of the city consists of the city, suburbs, and liberties, and contains 45,000 statute acres, being a borough subject to the city magistrates, and liable to city taxation. There are numerous charters, of which the earliest bears date 26th Henry III., and the latest 31st Geo. II. By charter 10th March, 6th James I., the city and all the lands extending from its walls, for the circuit of three miles on every side, were erected into a separate county, the bounds of which were laid down by commissioners. The suburbs on each side of the island were defined by act 53 Geo. III., c. 3; but since that period, 1813, they have extended considerably.

The school of St. Barr is supposed to have first drawn inhabitants to this neighbourhood. The city was walled in by the Danes in the ninth century, and was afterwards repaired by King John. The situation was on an island of an oval form, round which the river ran in two channels; beyond these were narrow marshes skirting steep banks, which surrounded the basin occupied by the old town on every side. These marshy flats have subsequently been drained and built upon, and the city now spreads over the high ground on both sides of the river. Prior to the reign of Edward IV., it would appear that the suburbs of the old city also had spread over these grounds, as a charter of the second year of that reign recites, 'that inasmuch as the suburbs extending a mile on every part of the city had been destroyed by Irish enemies, the rent of 80 marks a-year payable by the townsmen to the crown should be remitted, and the cocket or customs of the city should be granted for the purpose of constructing walls, until the inhabitants should be able to go peaceably one mile outside the same.' During the period alluded to in the account of Cork county, when the Irish had overrun the possessions of the decayed Yorkist nobility, and down even to the time of Elizabeth, the inhabitants of the city lived as if in a state of continual siege, never venturing beyond their walls except in numerous bodies, nor daring to marry out their daughters into the country, 'but contracting one with another among themselves, whereby all the citizens were related in some degree or another.' (Camden.)

About 1620 Cork was counted the fourth city of Ireland, being inferior both to Waterford and Limerick. From its low situation Cork can never be a place of defensive strength. The only severe siege it ever endured was in 1690, when held by Governor Mac Eligott, with six Irish regiments, for James. The siege was conducted by the duke of Marlborough, with whom were the dukes of Wirtemberg and Grafton (natural son of Charles II.), with a force of about 10,000 foot and 1200 horse. The town held out for five days; and after the English had lost a considerable number, among whom was the duke of Grafton, the garrison surrendered as prisoners of war. The city has enlarged rapidly since

the beginning of the last century, and continues to extend, although not so rapidly as during the time of the late war, which was very beneficial to Cork in a local point of view.

Cork is governed by a common council, consisting of the mayor, two sheriffs, recorder, and as many aldermen as with these shall not exceed the number of twenty-four. A corporate combination which originated about seventy years ago, under the name of the Friendly Club, operates to the unfair exclusion of Roman Catholics. Out of 2665 freemen, there were in 1833 only 73 Roman Catholics. The freemen are exempt from paying tythes. Of the whole number, 1593 were non-residents, of whom the majority had been created by special favour of the Common Council. The average income of the corporation is 6237*l.* per annum, which is rather more than the merely municipal expenditure; but by Grand Jury presentments, and otherwise, a sum of about 54,000*l.* per annum is disposed of at the discretion of the corporate authorities.

The port and harbour of Cork are under the regulation of a Board of Commissioners, acting under 1 Geo. IV., c. 52, the nominees of the corporation. Receipts and expenditure as follows:—

1830	Dr. 7872 <i>l.</i> 9 <i>s.</i> 3 <i>d.</i>	Cr. 8388 <i>l.</i> 0 <i>s.</i> 0 <i>d.</i>
1831	8172 8 2	8015 4 3
1832	6855 3 4	7236 11 2½

The paving, lighting, and cleansing of the city lie with Wide Street Commissioners, originally appointed by 5th Geo. III., c. 24, modified by subsequent and local acts. The annual expense for lighting was, in 1833, 3200*l.*; and for paving, repairing, widening, &c., of streets, 5600*l.*, of which 2800*l.* is defrayed by the county at large. This board is likewise under corporate control. It receives its income by Grand Jury presentments.

The supply of water is regulated by a Pipe Water Company incorporated under several acts, of which the last was 26 Geo. III., c. 38. A fourth part of the shares belong to the corporation. The charge to the inhabitants is two guineas per annum per house. There are no public fountains. Receipts of the company for 1833, 1577*l.* 5*s.* 8*d.*

The Grand Jury which presents for the public expenditure is nominated by the sheriffs: a sum of about 29,000*l.* is annually presented, all of which, with the exception of the income of the Wide Street Board, is disposed of by the Grand Jury. There is no municipal police, nor night watch of any kind. The turnkeys employed in the goal and bridewell, twenty-five in number, are the only force for the preservation of the peace supported by the corporation. The corporation is one of those subject to the 'New Rules' of 25 Ch. II.

The number of the constabulary in the county of the city of Cork on the 1st January, 1836, was—chief constables, 2; constables, 11; sub-constables, 62; horses, 6: expense for 1835, 2632*l.* 6*s.*, whereof 1260*l.* 19*s.* 5*d.* chargeable against the corporation of the city.

The convict establishment at Cork consists of a penitentiary, or convict depôt, at Cork, and a hulk at Cove. In 1834, the number of committals to the depôt was 284, and the expense 1899*l.* 2*s.* 8½*d.*: and the number of committals to the hulk at Cove, 441, and the expense, 2886*l.* 10*s.* 2*d.*

Of the charitable institutions the principal is the Foundling Hospital, originally intended as a workhouse. The Act which founds the institution has a clause permitting the reception of exposed children, and of this advantage has been taken to turn the institution solely to that purpose. In 1833 the number of children at nurse was 1319, and those within the walls 446. All are educated as Protestants. The hospital derives its income from a tax of one shilling per ton on all coals that come into the harbour. This impost is collected to a distance of twelve miles from the city. In 1833 it averaged upwards of 6000*l.* per annum. Skiddy's Almshouse, Bertridge's charity, the Blue Coat Hospital, and Green Coat Hospital, are other charitable foundations under the control of the corporation. Relief is extended from these solely to Protestants. The house of industry is supported by voluntary contributions and city and county Grand Jury presentments. Income in 1833, 4936*l.* 1*s.* 10*d.* Paupers admitted same year, 1850. Attached is a lunatic asylum supported by county and city Grand Jury presentments. Account presented in 1833, 4890*l.* Number of patients, 343. An hospital with 140 beds is attached. There are also two infirmaries and a Fever Hospital; but the accommodation is still far from being sufficient. A

sum of 30,000*l.* was, in 1833, bequeathed by a Mr. Lapp for the support of the aged Protestant poor of the city.

The city rental is estimated at 122,000*l.* on an allowance of 25 per cent. under real value. The number of the distressed population is very great. In 1832 it was estimated that of a city population of 86,534, 23,021 were depending on casual employment for subsistence; of these, 6250 were considered to be destitute. Poverty at present prevails to a frightful extent in the suburbs.

The main street which crosses from north to south, perpendicular to the length of the island, is the most antient part of the city. It was formerly divided into north and south by a bridge and castle. The Exchange, a heavy square building, stands on the site of the latter. The old castle and gates which terminated this street have been removed, as also the prisons subsequently built upon their sites. The island was formerly intersected by numerous canals, which have been arched over from time to time, and now form the principal modern streets. The Grand Parade was thus formed in 1780; Patrick Street, in like manner, in 1783; and Nile Street in 1795. The South Mall, the best street in Cork, and Nelson's Place, had likewise a similar origin. The insular appearance of the central part of the city is thus in great measure removed. Cork now covers a large extent of high ground on both banks of the Lee, as well as the low ground which was formerly occupied by marshes between. The greater part of these marshes were drained about 1720—30. The parish of St. Paul was formed of these marshes, and the church of St. Paul built on the reclaimed land in 1723. About the same time the cathedral, which had suffered in the late siege, was rebuilt, as also Christchurch, for a like reason. St. Anne's Shandon was rebuilt in 1722, and St. Peter's in 1782. The appearance of the city is materially affected by an unsightly variety of colours, arising from the different sorts of building materials employed. One side of the steeple of St. Ann's, or Upper Shandon Church, has been built of red sandstone, and the other three of dark limestone. New quays are being constructed, which add much to the convenience and

beauty of the city. Mr. Inglis calls Cork 'a very fine city, surpassed by few in the excellence or width of its streets, and deficient only in the architectural beauty of its public buildings.'

Three large Roman Catholic chapels of cut stone are building; and the court-house, now in hand, is to cost 16,000*l.*

Since the termination of the late war, the trade of Cork has, in some measure, changed its character. Owing to the cessation of government contracts there is no longer the same field for great mercantile houses; the number of minor dealers has increased proportionately. The carriage trade from England is at present very brisk from the smaller traders supplying themselves direct from London or Bristol. The chief import trade is that of timber, of which the annual average is 15,000 tons. The chief export trade is in bacon, butter, corn, live stock, and provisions. Cork butter holds a very high character in the market, chiefly owing, it is said, to the superior cooperage of the casks. The export of bacon and live-stock is on the increase. The manufacture of glass, metal castings, and iron-work, is carried on briskly. Leather is manufactured to the value of 100,000*l.* per annum. A woollen manufacture gives employment to about 200 persons. There are numerous and very extensive distilleries and breweries, and a large manufacture of flour and meal.

Merchant vessels unload at Passage, about six miles from the city, from which goods are transported in lighters of about thirty tons to the quays. The amount of Customs collected in the district of Cork for the year 1835 was 216,446*l.* 1*s.* 7*d.*; and of Excise duty for the same district, 252,452*l.* 14*s.* 5½*d.*

The number of stamps issued to newspapers in Cork in 1835, was—

In 1834 there were in the nineteen parishes comprehended, wholly or in part, within the county of the city of Cork, 139 schools, educating 5935 males and 4489 females; total children under instruction, 10,424. Of these schools, 26 give gratuitous instruction; several of these are under the management of religious sects. The Cork library, which was founded in 1807, owes its origin to the exertions of the Rev. Doctor Hincks, and formerly enjoyed an annual parliamentary grant. There is also a Mechanics' Institute, with a school for 120 children.

CORMORANT. [PELECANIDÆ.]

CORN-TRADE. From a very early period of our history the corn-trade of the country has been the subject of legislative interference and restriction. At first, and while the kingdom was thinly peopled, it was deemed good policy, in order to insure a sufficient supply of food for its inhabitants, to forbid the exportation of corn, while its importation was freely permitted; but, in later times, during which the population has increased with a rapidity rarely seen in long-settled countries, the policy of the legislature has been altogether different. The object has been to stimulate home production by prohibiting importation, or by restricting it in such a degree as to secure to the native farmers a monopoly of the home market. It needs no argument now to show that the policy of our ancestors was ill calculated to insure the end which they had in view, that of providing a

* Return incomplete.

sufficiency of cheap food for the common people; how far the opposite policy has been found to answer the avowed object of its advocates it is not our present intention to inquire. That object professes to have for its ultimate aim the securing of a constant sufficiency of a principal article of food, independent of all foreign countries, by means which shall insure to the home grower an adequate return for the capital and skill employed.

The earliest statute extant upon this subject is the 34th Edw. III., c. 20, passed in 1360-61, by which it is enacted, that 'the passage of corn shall be prohibited in all the ports of England, so that none have licence nor warrant to pass with such corn in anywise, unless it be to Calais or Gascoigne, or to other special places which it behoveth that the king cause to be furnished with the corn of England, and that at his own ordinance and licence.'

The phraseology of this act has led to the supposition that exportation was previously illegal, except with a licence from the king, and that the object in framing this law was to define and restrict the royal prerogative in this particular. In 1394 another act was passed (17 Richard II., c. 7) of a somewhat contrary tendency. By this new law licence is granted by the king—such are the terms of the act—to all his liege people of his realm of England, to ship and carry corn out of the said realm, to what parts that please them, except to his enemies, paying the subsidies and devoirs thereof due, notwithstanding any ordinance, proclamation, or any defence (prohibition) made before this time to the contrary; nevertheless he will that his council may restrain the said passage when they shall

think best for the profit of the realm.' This act was confirmed in 1425 by the act 4 Henry VI., c. 5. Eleven years later it was thought necessary to fix a limit in regard to price at which the liberty to export should cease, and that limit was declared (15 Henry VI., c. 2) to be 6s. 8d. per quarter for wheat and 3s. per quarter for barley. This act was passed for only a limited time, and had expired, when, in 1441, on the meeting of parliament, it was renewed in the following terms: 'Our sovereign lord the king, forasmuch as this statute is not now in his force, and that many counties adjoining to the sea may not sell the substance of their corn but by carriage and bringing by the sea, hath ordained, that the statute and ordinance aforesaid, now expired, shall begin to hold his force at the Feast of the Nativity of our Lady next ensuing, and shall endure from thence till the parliament next to be holden after the same feast, so that a parliament be holden within ten years next ensuing after the first beginning of this present parliament, and if so that there be no parliament holden within the same ten years, that then it shall continue and endure till the end of the same ten years:' in 1444 this act was 'ordained to be perpetual, and stand in his force for ever' (23 Henry VI., c. 5).

The limited permission thus given to export their produce must be attributed to the increasing power of the land owners; and it may be taken as evidence that the cost of production in this kingdom was at least equally moderate with the cost in neighbouring countries, that in all this time no attempt was made to prohibit or restrict the importation of the produce of other countries. Such a restriction was however imposed in 1463 by the statute 3 Edward IV., c. 2, which on the plea that 'the labourers and occupiers of husbandry within this realm of England be daily grievously endamaged by bringing of corn out of other lands and parts into this realm of England, when corn of the growing of this realm is at a low price,' enacts that 'no person, from the feast of Saint John the Baptist next ensuing, shall bring into England any wheat, rye, or barley, not of English or Irish growth, unless the price of wheat shall exceed 6s. 8d. the quarter, that of rye 4s., and that of barley 3s., on pain of forfeiture of the grain.' The statutes here mentioned, by which the prices were established at which the importation and exportation of corn were respectively to cease, continued in force until 1534, when a new act (25 Henry VIII., c. 2) prohibits, except by licence from the crown, the exportation of grain, the reason for which alteration is thus quaintly expressed in the preamble to the act: 'Forasmuch as dearth, scarcity, good, cheap, and plenty of cheese, butter, capons, hens, and other victuals necessary for men's sustenance, riseth and chanceth of so many and divers occasions that it is very hard and difficile to put any certain prices to any such things, no person or persons, unless it be by licence under the king's great seal, from henceforth shall carry or convey any corn, beeves, muttons, veals, porks, or any other of the above said victuals to any parts beyond the sea, except only for the victualling the towns of Calais, Guinnes, and the marches of the same, and except for victualling of ships passing the seas.' The civil wars which preceded the accession of Henry VII. had caused much land to be thrown out of cultivation, and the act of 1534 was probably occasioned by the consequent diminution of produce, but this attempt failed, as it necessarily must, to increase the supply of grain, which effect would best have been brought about by a removal of all restriction. Such a course would have ill agreed with the imperfect ideas upon such subjects which then prevailed; but as the evil was increased during the next 17 years, and it was thought necessary to apply some remedy, the statute 5 and 6 Edward VI., c. 5, was then passed. This statute is entitled, 'An act for the maintenance and increase of tillage and corn,' and it enacts that thenceforth at least as much land should be tilled in every parish as had been under the plough at any time since the accession of Henry VIII., under a penalty, to be exacted from the parish, of 5s. for every acre that should be deficient. The general permission to export grain, which had been taken away in 1534, was restored in 1554 (1 and 2 Philip and Mary, c. 5) whenever the prices were at or under 6s. 8d. per quarter for wheat, 4s. for rye, and 3s. for barley. The preamble to this act makes it appear that it was passed, not in consequence of the prevalence of any sounder views of public economy, but because it was found impossible to prevent exportation, and it was thought that better success would

attend the regulation than the prohibition of the trade. In 1562 an alteration in the law was made, by enlarging the limits of the prices which governed exportation, and these were fixed at 10s. per quarter for wheat, 8s. for rye, and 6s. 8d. for barley; and nine years later it was enacted (13 Eliz., c. 13) that corn might be exported on payment of certain specified duties at all times when no proclamation had been issued to the contrary. The law of 1463 had all this time been in existence, prohibiting importation while the prices of wheat, rye, and barley should be under 6s. 8d., 4s., and 3s. respectively; but the prices that had for some time prevailed rendered this law inoperative, and the law of 13 Elizabeth therefore gave virtual freedom to the trade in corn.

In the succeeding reigns and up to that of William and Mary this system was continued, but accompanied by various modifications as regards the limiting prices and the rates of duty chargeable. The prices at which export was permitted were from time to time enlarged, until, in 1670, wheat might be shipped away at any time when the price did not exceed 53s. 4d. per quarter. At the same time import duties were imposed, so heavy as to amount to a prohibition, the object of these regulations being to keep the price of wheat always as high as 53s. 4d. per quarter for the advantage of the land-owners. Not satisfied, however, with this degree of favour, this powerful class succeeded in 1689 in procuring an act (1 William and Mary, c. 12) whereby they secured the payment of a bounty amounting to 5s. per quarter on the exportation of wheat when the price did not exceed 48s. per quarter; and bounties according to the same scale were granted for the export of barley and other grain.

Not content with interposing obstacles to a free trade in corn with other countries, our ancestors thought fit to place restrictions upon that trade within the kingdom. It was imagined that if the consumers could be brought to deal immediately with the growers, the profit of intermediate dealers would be saved. Under this impression, both parties looked unfavourably upon those dealers, the sellers imagining that they could obtain better prices and the buyers that they could purchase cheaper but for the middlemen, while the common people were easily led to believe that the dearths which then frequently occurred were attributable to the practices of the dealers in buying up corn and withdrawing it from the market. An act was passed, declaring it to be an offence to buy corn in one market with intent to sell it again in another, and persons guilty of this offence, to which the name of *engrossing* was given, were punished with imprisonment and the pillory. By a statute of Elizabeth, no person was permitted to convey corn from one part of the kingdom to another, unless he had a licence for the purpose, the right of granting or withholding which was confided to the magistrates in quarter sessions. These restrictions were modified in 1624, and by the act 15 Charles II., c. 7, the engrossing of corn was made legal, whenever the price of wheat did not exceed 48s. per quarter. So recently as the year 1800, when the price of wheat exceeded 100s. per quarter, engrossing however has been held to be an offence at common law, and a corn-dealer was convicted of it, but was not brought up for judgment.

The act of 1689 was modified in 1773, by reducing to 44s. per quarter the price at which the payment of bounty was to cease, and in 1815 the granting of bounty was discontinued by law. In fact no bounty could have been claimed at any time after 1792, in which particular year the average price for the whole year was below the price fixed in 1773. At that time (1773) importation was permitted upon payment of the nominal duty of 6d. per quarter whenever the price should be above 48s. This permission was considered injurious to their interests by the landowners, who, on the plea that the country might become dependent upon foreign countries for its supply of food, succeeded in 1791 in obtaining an act whereby the price at which importation was allowed at 6d. per quarter was raised to 54s., a duty of 2s. 6d. was imposed when the price was between 50s. and 54s., and 24s. 3d. per quarter was charged when the price was below 50s. A new law, passed in 1804, shifted the price at which the prohibitory duty of 24s. 3d. was charged to 63s.; between that price and 66s. the duty was 2s. 6d.; and above 66s., only 6d. per quarter. Under the act of 1791 the maritime counties of England were divided into twelve districts, and importation and exportation were regulated in each district by their respective prices, but in 1804 this plan was altered, and the aggregate average of the

twelve districts was taken as the measure for regulating importation and exportation to and from the kingdom.

A bill for raising the duties on importation, which was brought into the House of Commons in 1814, met with so much opposition that it was abandoned; but in the following year an act was passed, after great opposition, and exciting great clamour on the part of the people, allowing the free importation of corn from foreign countries, in order to be warehoused or re-exported, but forbidding the importation for consumption, unless the average prices were, for wheat 80s.; for rye, pease and beans, 53s.; for barley 40s. and for oats 26s. Every description of corn might be brought for consumption from the British colonies, when the prices were, for wheat 67s., rye, peas, and beans 44s., barley 33s., and oats 22s. The deficient harvests of 1816 and 1817 raised the prices above these limits, and so much grain was imported free of duty that a considerable surplus was left for future and more abundant years. One of these years of abundance occurred in 1822, and during the next twelve months the prices of grain fell below what they had been in any year since 1792. It was expected, on the part of the land-owners, that the effect of the act of 1815 would have been to keep the price of wheat steady at or about 80s. per quarter, but this expectation was so far from being realised, that, if we except the year of scarcity already mentioned, the average price of the period which elapsed before the system of prohibition was exchanged for that of a graduated duty in 1829, was only 58s. 5d. per quarter. In the mean time, by an act passed in 1823, the law of 1815 was modified so as to allow of importation whenever the prices were, for wheat 70s., for rye, peas, and beans 46s., for barley 35s., and for oats 25s. per quarter, but a duty of 17s. a quarter for wheat (and other rates in proportion for other grain) was to be payable during the first three months of importation, and 12s., &c. thereafter the prices of corn were never such during its continuance as to bring this act into operation. In 1825 the importation of wheat from the English colonies in North America was legalised upon payment of a duty of 5s. per quarter, without reference to the price in the English market. In 1826, a long continued drought caused great apprehensions concerning the coming harvests, and in order to prevent the opening of the ports to fresh importations, and the consequent probable admission of a quantity of corn beyond the actual wants of the country, by which prices would have been affected perhaps for years after, permission was given to the government to admit by proclamation 500,000 quarters of foreign wheat then warehoused in the kingdom.

The inconvenience of the system of alternate prohibition and unlimited importation was at length fully recognised by all parties, and in 1829 the act was passed (9 Geo. IV. c. 60) by which the trade in corn has since been regulated. The principle of this act is the constant freedom of importation upon the payment of duties fluctuating according to the average price of grain, decreasing as the price advances, and increasing as the price falls. The following table exhibits the scale of duties graduated according to the average prices of the different kinds of grain.

WHEAT.			BARLEY.		
When the price shall be—	per qr.		When the price shall be 33s. and

Rye, pease and beans—		
" until the average price shall be 41s. per qr.	3	0
" when " at or above 41s.	0	6

Meal or flour, the produce of each different kind of grain, is admitted at rates of duty equivalent to those chargeable on each kind of grain respectively. In calculating such duties the following quantities by weight of meal or flour are deemed to be equivalent to one quarter of grain, viz. Wheat-meal or flour, 392 lbs.; barley-meal, bean-meal, and meal of maize or Indian corn, 384 lbs.; rye-meal, 424 lbs.; and oatmeal, 176 lbs.

Having thus offered a brief sketch of the laws by which the trade in corn has been and is regulated in this country, it remains to be shown what has been the course and extent of that trade during the period for which authentic records exist.

Various attempts have been made at different times to estimate the consumption of this kind of food within the kingdom, but in the absence of any machinery for that purpose, such estimates must always partake of a great degree of uncertainty.

The following estimate of the produce of England about the close of the seventeenth century, was made by Mr. Geoffrey King, whose statistical calculations have usually been received with much confidence. At that time wheat formed a much smaller proportion of the food of the English people than it does at present.

Wheat	14,000,000 bushels.
Rye	10,000,000
Barley	27,000,000
Oats	16,000,000
Pease	7,000,000
Beans	4,000,000
Vetches	1,000,000

79,000,000 in all.

The quantities here assumed were not all consumed within the kingdom, a part being exported under the Bounty Act, as hereafter stated. Mr. Charles Smith, the author of the celebrated 'Tracts on the Corn Trade,' estimated that the six millions of inhabitants, then supposed to be living in England and Wales, consumed annually 3,750,000 quarters of wheat, 1,016,125 barley, 999,000 rye, 1,791,125 oats—and that there were besides used annually within the kingdom—

90,000 quarters wheat—distilled, and made into starch.	
3,300,000 " barley—made into beer;	
117,000 " ditto—applied to other uses;	
2,461,500 " oats—used for horses, &c.	
31,000 " rye—used by tanners, and for fattening hogs;	
90,000 " beans and pease—for negroes, horses, and hogs;	
134,000 " pease—for sailors, &c.;	
90,000 " rape and other seed—for obtaining oil.	

The aggregate of these quantities makes up nearly 50 per cent. more than the estimate of Mr. King, without making any allowance for the shipments to foreign countries, which, at that time, averaged about 1,500,000 bushels annually, and not taking into account the quantity required for seed, which must have amounted to about as much as the exports.

Dr. Colquhoun estimated the average annual consumption of the United Kingdom in 1812, as follows:—

Species of Grain.	Population (using each kind of grain.)	Average quantity.	Consumed by man.	Consumed by animals.	Used in beer and spirits.	Used in various manufactures.	Total number of quarters.
		Bushels.	Quarters.	Quarters.	Quarters.	Quarters.	
Wheat	9,000,000	8	9,000,000	..	..	170,000	9,170,000
Barley	1,500,000	10	1,875,000	210,000	4,250,000	..	6,335,000
Oats	4,500,000	12	6,750,000	10,200,000	..	..	16,950,000
Rye	500,000	10	625,000	59,000	..	1,000	685,000
Beans and Pease	500,000	8	500,000	1,360,000	..	..	1,860,000
	16,000,000		18,750,000	11,829,000	4,250,000	171,000	35,000,000

No allowance for seed is included in this estimate, which, besides, was made when the population was less than two thirds of its present amount. If we allow that four millions of the population in Ireland are fed without having recourse to corn, we still have more than twenty-two millions of grain-consuming people. Taking those circumstances into consideration, it will perhaps not be beyond the truth if we estimate the quantity of grain actually used in the United Kingdom at about fifty-five millions of quarters annually. The most careful estimate that has yet been made concerning the employment of the soil in the United Kingdom gives rather more than nineteen millions of statute acres for arable and garden land; and if we assume that the produce of all kinds of grain, taking one kind with another, amounts to three quarters to the acre, which is known to be very near to the actual produce, we arrive by that mode of computation at a result which agrees substantially with the estimate already offered.

The circumstance to which allusion has just been made, that half the population of Ireland do not employ grain for their subsistence, leaves a considerable quantity of the produce of that part of the kingdom for use in England. The greater part of Irish grain thus brought to other parts of the kingdom consists of oats; the quantity of wheat is also considerable. The shipments have increased very materially since the Union up to 1828, but since that time have been nearly stationary, as will be seen from the following statement, which includes all sorts of grain.

Quarters.	Quarters.	Quarters.
1801 . 900	1813 . 977,164	1825 . 2,203,962
1802 . 467,067	1814 . 812,805	1826 . 1,692,189
1803 . 343,548	1815 . 821,192	1827 . 1,829,743
1804 . 316,958	1816 . 873,865	1828 . 2,826,135
1805 . 306,923	1817 . 699,809	1829 . 2,305,806
1806 . 466,947	1818 . 1,207,851	1830 . 2,212,729
1807 . 463,406	1819 . 967,861	1831 . 2,419,643
1808 . 656,770	1820 . 1,417,120	1832 . 2,605,734
1809 . 933,658	1821 . 1,822,816	1833 . 2,736,281
1810 . 632,849	1822 . 1,063,089	1834 . 2,742,586
1811 . 430,189	1823 . 1,528,153	1835 . 2,679,342
1812 . 600,268	1824 . 1,634,024	

The proportions of different kinds of grain in the last three years of the series were as follows:—

	1833.	1834.	1835.
Wheat	844,201	779,504	661,776
Barley	107,519	221,578	166,503
Rye	167	982	615
Oats	1,762,519	1,719,501	1,822,767
Indian corn	117	75	—
Beans	19,113	18,770	24,234
Pease	2,645	2,176	3,447
	2,736,281	2,742,586	2,679,342

Until the breaking out of the war of the French Revolution, this country may be said to have been an exporting country for corn. In the ten years from 1760 to 1769 there were only two years in which the quantity of wheat exported did not exceed the quantity imported; the aggregate average price during those ten years being 45s. 10d. per quarter; or excluding the two years of importation (1767 and 8), 41s. 9d. per quarter. At these prices the export was not much stimulated by the bounty, the whole excess of the quantity sent abroad being only 1,384,561 quarters. In the next decennary period, five were years of export and five of import, the average prices of each division being 40s. 6d. and 49s. 5d. respectively. In the next period of the like duration, viz., 1780 to 1789, six were years of export and four of import, the average prices being 44s. 5d. for the years of exportation, and 47s. 10d. for the other years. Of the next decennary period, 1792, the last year of

peace, was likewise the last year of exportation; if that year, when the average price was 41s. 9d., be excluded, the average price of the period was 57s. 6d. per quarter, and the importation amounted to 3½ millions of quarters. The importations of wheat from foreign countries, including our North American colonies, in each year from 1800 to 1835 inclusive, and the average price according to the London Gazette, have been as follows:—

	Quarters.				Quarters.			
1800	1,242,507	110s.	5d.	1818	1,503,518	83	8	
1801	1,396,359	115	11	1819	122,133	72	3	
1802	498,359	67	9	1820	34,274	65	10	
1803	297,145	57	1	1821	2	54	5	
1804	398,067	60	5	1822	..	43	3	
1805	842,879	87	1	1823	12,137	51	9	
1806	280,776	76	9	1824	15,777	62	0	
1807	379,833	73	1	1825	525,231	66	6	
1808	..	78	11	1826	315,892	56	11	
1809	424,709	94	5	1827	572,733	56	9	
1810	1,491,341	103	3	1828	842,050	60	5	
1811	238,366	92	5	1829	1,364,220	66	3	
1812	244,385	122	8	1830	1,701,885	64	3	
1813	425,559	106	6	1831	1,491,631	66	4	
1814	681,333	72	1	1832	325,435	58	8	
1815	..	63	8	1833	82,346	52	11	
1816	225,263	76	2	1834	64,653	46	2	
1817	1,020,949	94	0	1835	28,483	39	4	

It was one principal object of the framers of the law of 1829 to prevent fluctuations in the prices of English grain. How far that object has been attained will be seen by the following statement of the highest and lowest prices that have occurred in each of the years since elapsed, and the per-centage difference between the same, calculated upon the lowest price of the year.

	Highest.		Lowest.		Per-centage fluctuation.
	s.	d.	s.	d.	
1829	75	3	56	3	33½
1830	72	11	56	1	30
1831	73	5	60	5	21½
1832	63	5	52	5	20½
1833	55	5	49	10	11½
1834	49	6	41	5	19½
1835	42	10	36	8	17

The fluctuation during the whole period of seven years is thus seen to have exceeded 100 per cent. if calculated upon the lowest price.

The principal supplies of foreign corn to Great Britain are drawn from Danzig, Hamburg, Rostock, and the ports of Russia on the Baltic. The shipments from Danzig are of the produce of Poland, and are brought down the Vistula on rafts to the port of shipment. The permission to import from British colonies at a low rate of duty has not occasioned the shipment of any considerable quantity. There is reason for believing that the produce of our North American colonies is not usually more than enough, if indeed it be enough, for their own consumption, and that in every case where corn has been shipped thence for England, at least an equal quantity has been procured from the United States to supply its place. During the last one or two years this trade has been interrupted by the high prices in the United States, and the shipments to Europe from British America have consequently nearly ceased.

CORNA'CEÆ, a small natural order of polypetalous exogens, recently cut off from Caprifoliaceæ, to which they were formerly referred. They consist principally of shrubs, very rarely of herbaceous plants, having opposite strongly-veined leaves without stipules, an inferior ovary, in each of whose cells is one pendulous ovule, four valvate petals,

four stamens alternating with them, and a drupaceous fruit with two cells; the embryo lies in some fleshy albumen.

Many of the species are cultivated in European gardens, especially *Cornus mas*, or cornel-tree, *Cornus alba*, sanguinea, and sericea, called dogwood, together with *Benthamia fragifera*. They are valued either for their bright red shoots, which in the winter are highly ornamental, or for their richly-coloured fruit. *Benthamia fragifera*, in particular, has its drupes collected in roundish strawberry-like heads, which have a beautiful effect in the south-west of England, whither it has been some years introduced from the Himalaya Mountains. The bracts of some species of this order are very large, and resemble petals, and being white, they are a gay substitute for the flowers themselves, which are small and inconspicuous. This is particularly the case with *Cornus herbacea* and *florida*, and *Benthamia fragifera*. Medicinally, Cornaceous plants are of great importance. The American physicians esteem the bark of *Cornus florida* and *sericea* equal to *Cinchona* as a febrifuge.

Formerly the *Cornus mas* used to be cultivated in gardens for the sake of its fruit, which were called cornelian cherries. It is a deciduous tree, with clusters of small starry yellow flowers appearing in the spring before the leaves. The leaves are ovate-lanceolate, acute, wavy, and of a dull greyish green. The fruit consists of oblong drupes of a red or occasionally a yellow colour; they are excessively austere before ripe, but eventually *blet* like medlars, and then become eatable.

[*Cornus mas*.]

1, an expanded flower, with the petals and stamens; 2, an ovary cut through vertically, showing a cup-like disk surrounding the base of the style, and the pendulous ovules; 3, a fruit cut so as to show the stone; 4, a vertical section of the stone, exhibiting the embryo and albumen.

CORNA'RO, LUIGI, or LEWIS, a Venetian nobleman, celebrated for the successful care he took of his health, by means of diet. He was originally of a weak constitution, and by the time he had attained mature manhood his intemperate indulgence in eating, drinking, and other pleasures, had brought on so many disorders that life was a burden to him. He informs us, that from his thirty-fifth year to his fortieth, he spent his nights and days in almost unremitted suffering. Having tried all their other remedies in vain, his physicians earnestly recommended a more temperate course of life, and when he was forty he began gradually to diminish the quantity of his food, and to eat

and drink nothing but what nature required. At first he found this severe regimen very disagreeable, and he confesses that he did occasionally relapse to 'the flesh-pots of Egypt.' But as each of these relapses brought back his old symptoms, he soon exerted all his resolution, and by a spare and simple diet became a hale man within a year. From temperance he proceeded to abstemiousness, until at last the yolk of an egg was often considered sufficient for a meal. His health and spirits kept improving all the while, and as for enjoyment in eating, he says he brought himself to relish dry bread much more than he had ever done the most exquisite dainties of the table. At the same time he carefully avoided heat and cold, over-fatigue, late hours, sexual excesses, and all violent passions of the mind, having fully ascertained that nothing is more destructive of health and longevity than an indulgence in ambition, envy, hatred, and the like. Melancholy was to be equally avoided, but from this depressing passion his light food and peaceful slumbers kept him wholly free. He recommended, by practice, exercise, riding on horseback, the sports of the field, and those gentle excitements derivable from fine scenery in the country, the contemplation of architectural and other works of art in towns and cities, and the hearing and playing of music.

He records of himself, that when he was a very old man he used often to sing with his grandchildren, and that too with a voice louder and clearer than when he was a young man.

When he was seventy years old he suffered a dreadful accident, by which his head and body were battered, and a leg and arm dislocated. Considering his advanced age, the physicians thought these injuries must speedily prove fatal, but after his limbs had been set, he recovered under the slightest medical treatment, and without experiencing any fever. Hence he inferred that a life of strict temperance is a safeguard against the ill effects that generally follow such accidents. When he was about seventy-eight, the quantity of nourishment he took in the twenty-four hours was, of bread, light meat, yolk of egg, and soup, twelve ounces in all; of wine, fourteen ounces; and these were portioned out into four separate meals. By the advice of his medical friends he then added two ounces to his solid food, and two ounces to his wine; but this trifling increase was soon given over, as it destroyed his ease and vivacity, and made him peevish and melancholy. In his eighty-third year he wrote his treatise 'Of the Advantages of a Temperate Life.' He subsequently added three other discourses on the same subject, the fourth and last being included in a letter to Barbaro, the patriarch of Aquileia, to whom he states, that though at the age of ninety-five, he is still in possession of health, vigour, and the perfect use of all his faculties.

Cornaro died at Padua in 1566, when, according to the best authorities, he was ninety-eight years old. His work was very frequently published in Italy, both in the vernacular tongue and in Latin. It has been translated into all the civilized languages of Europe, and was once a most popular book. There are several English translations of it, the best being one which bears the date of 1779. Addison praises the original work in the 'Spectator.' 'This treatise,' he says, 'has been taken notice of by several eminent authors, and is written with such a spirit of cheerfulness, religion, and good sense, as are the natural concomitants of temperance and sobriety. The mixture of the old man in it is rather a recommendation than a discredit to it.' Cornaro's system has had many followers. The best authenticated case we know of its being rigorously and successfully pursued in England is that of Thomas Wood, a miller of Bilericay in Essex, to whom a neighbouring clergyman lent the 'Life of Cornaro.' (*Medical Transactions of the College of Physicians*.) The old Venetian does not insist on such extreme abstinence as he practised—both the quality and the quantity of food, he says, ought to depend on the constitution; but he is probably right in hinting that men of all constitutions shorten their lives and weaken their enjoyments by over-eating and drinking.

CO'RNEA. [EYE.]

CORNEILLE, PIERRE, commonly called the father of the French drama; not that he was really the earliest of the French dramatists, for he was preceded by Jodelet, Gamier, and many more, but because he so far excelled his predecessors, that they are now forgotten, while he remains one of the French classics. He was born in the year 1606, at

Rouen, where his father was an advocate. Pierre himself was destined for the bar, and had begun to practise in that profession, in which, however, he had but little success. Having been taken by one of his friends to see a lady of whom the latter was enamoured, he fell violently in love with her himself, an incident which furnished him with the plot of his first comedy *Milete*, produced in 1629, which was followed by the dramas of *Chitandre*, *La Veuve*, *La Galerie du Palais*, and *La Place Royale*, all produced between that time and the year 1636. It appears that Cardinal Richelieu then aspired to be the grand arbiter in matters of dramatic taste. He sketched the plan of a comedy, with which Corneille, although a poet patronized by the Cardinal, had the hardihood to find fault, and this produced a lasting hostility on the part of the priest-prime-minister against the dramatist.

In 1636 Corneille's fame rose at once to its height. M. Chalon had recommended him to study the Spanish dramatists, particularly Guillen de Castro; and it is on the 'Cid' of this author that the celebrated Cid of Corneille was principally founded. This piece delighted the Parisians to enthusiasm; they had seen nothing equal to it, and they looked on it as a complete miracle. The author had before exhibited some tragic power in an earlier work called 'Medée,' but it is not till the production of the Cid that we must look on him as 'le grand Corneille.'

The French Academy, which was founded by Richelieu, was by no means disposed to share the general enthusiasm. They (or rather Chapelain) wrote an elaborate critique on the Cid, in which they ventured to point out some defects, while they allowed the poet genius of the highest order, and rather found fault with the subject of the drama than Corneille's manner of treating it. This critique is in most editions of Corneille's works, affixed to the tragedy of the Cid, under the title of 'Sentimens de l'Académie Française sur la Tragi-comédie du Cid.'

Corneille felt himself hurt by an imputation cast upon his inventive powers; it was hinted that he borrowed his plot from the Spanish, because he had not imagination enough to contrive a new one. He long sought for a subject which should silence these aspersions of his enemies, and at last turned his attention to Roman history, from which he drew the plots of his tragedies 'Horace' and 'Cinna,' both produced in 1639. The former fully proves his ingenuity in moulding a complicated story out of scanty materials.

These were followed by 'Polyeucte,' founded on the history of the martyr of that name, which by some is reckoned his chef-d'œuvre. 'La Mort de Pompée,' and 'Le menteur' (an adaptation of the Spanish comedy 'La Sospechosa Verdad') succeeded, and were followed by a train of pieces with varying success till the year 1653, when the tragedy of 'Pertharite' was produced, and was decidedly unsuccessful. This misfortune disgusted Corneille for a time with the stage, and he turned his attention to other kinds of poetry, and began to versify Thomas à Kempis, 'De Imitatione Christi.' Six years wore off his disgust, and he again turned to the drama: the success of 'Œdipe,' produced in 1659, encouraged him to go on. He even turned his attention to opera writing, and the 'Toison d'Or' remains a specimen of what he has done in that species of composition. The success of this piece was decided, but it was only the flame of an expiring lamp; in vain he wrote fresh tragedies, in vain did his friends laud them to the skies; the public began to suspect that his genius was worn out, and he had ceased to be popular before the production of his last pieces, 'Pulcherie' (1672) and 'Surenne' (1674). His latter works have sunk entirely into oblivion. He died in the year 1684, at the age of seventy-eight, having been a member of the Académie thirty-seven years. In private life he was a quiet domestic man, with a bluntness of manners that was almost repulsive. If we may trust his biographers, he had a few small faults, but no vice; his whole pleasure was centred in his own family. He and his brother had married two sisters, and resided together in one house, till death separated them.

It was, we have seen, by the 'Cid,' that Corneille first rose into celebrity; two or three passages of his 'Medée' are occasionally quoted, to show the development of a young poet, but as a whole it is forgotten, and probably would never have been cited, had not its author distinguished himself by his subsequent productions. His early comedies have sunk deservedly into oblivion, being dry tedious

pieces of declamation, without point, and founded on a false morality; their only redeeming merit is ingenuity of construction.

If we now peruse the 'Cid,' we shall be at a loss to discover the cause of that enthusiasm which its appearance created in France, when, as it is said, all Paris saw Chimène (the heroine) with the eyes of Rodrigue (the hero). But it must be remembered that the French stage was in a wretched state before the appearance of Corneille; the pieces of his predecessors were for the most part dull and heavy, and without the slightest attempt at delineation of character. As a specimen of these old dramas, we refer to a translation of Garnier's 'Cornelia,' in Dodsley's old plays, which, strange to say, is commended by Ben Jonson. The chief fault found with the 'Cid' by contemporary critics was the selection of the subject. Don Rodrigue, to revenge a blow given to his father, kills the father of Chimène, his mistress, in a duel; she at first makes every effort to accomplish his death, but at length, at the request of the king of Spain, she marries him. It is the contention between love and duty in the heart of the heroine which is the leading feature of the drama. The Aristarchus of the 'Académie' called the lady a monster of filial impiety, and said that she had no right to love Rodrigue at all; the opposite party contended that the preservation of her early love under all circumstances, was perfectly amiable and feminine. This literary battle, indeed, seemed rather to be fought for the morals of the heroine, than the merits of the play. Those who would wish to read the charge and its answer, may turn to the 'Examen' above referred to, and La Harpe's 'Cours de la Littérature.' It should be observed that this drama of the 'Cid' is, by critics of the romantic school, preferred to his other works, as partaking somewhat of that spirit of chivalry which animated their idol, the Spanish drama.

The other most celebrated piece of Corneille's is 'Horace,' the last act of 'Cinna' being reckoned a chef d'œuvre rather than the whole play. Fontenelle's praise of 'Horace,' for the ingenuity of its construction, is unquestionably just. 'Corneille,' says he, 'has but a combat to work upon, that of the Horatii and Curiatii, and out of this scanty subject he constructs a tragedy.' The prospect, indeed, was but barren, yet the tragedian, by giving Horatius a sister of the Curiatii to wife, while his own sister is (according to the old story) betrothed to one of these Curiatii, and by dwelling on the times immediately preceding and pending the combat, has thrown an interest into his piece which was scarcely to be anticipated. Here indeed his praise ends, for the last two acts are occupied by the murder of Horatius' sister, and its consequences; hence, as La Harpe justly observes, they form a separate plot, totally unconnected with the preceding part of the play. The father of Horatius, as an illustration of the stern Roman character, is the most commended by the admirers of this tragedy.

The general censure passed on Corneille's comedies does not extend to 'Le menteur,' which is one of his later productions, and is an excessively humorous and amusing piece. The English know it well from Foote's version, the 'Liar;' and indeed it was introduced into this country long before the time of Foote; an anonymous translation was acted in 1685, under the name of the 'Mistaken Beauty,' and a subsequent adaptation was written by Sir R. Steele, called the 'Lying Lover.'

The chief merit which is assigned to Corneille by his admirers is his dignity; they allow that Racine may be more elegant, more touching, but in a 'noble ferocity' they say that Corneille stands alone. It must be remembered that when Corneille wrote the French tongue was still in an uncultivated state; he must not therefore be taken as a model of French style, his verse being often defective, and his language disfigured by barbarisms.

Voltaire, on learning that a great-niece of Corneille was entirely without fortune and almost without friends, took her into his house at Ferney, where she completed her education, and in a few years was married by Voltaire to a captain of dragoons. Besides giving her a marriage portion, Voltaire undertook to write a commentary on Corneille, for the benefit of his protégée. The work, which was printed by subscription, and liberally patronized by the French king, the Duc de Choiseul, Madame de Pompadour and others, brought in 50,000 francs, as an addition to the young lady's marriage portion. Voltaire, though a great admirer of Corneille, was not blind to his numerous faults, which he

has pointed out at full length in his 'Commentaries' in two vols. 8vo. (vols. 48, 49). Edition of Lequien, Paris, 1826.

CORNEILLE, THOMAS, brother of Pierre, was twenty years younger, being born in the year 1625. He distinguished himself in early life by a comedy in Latin verse, which he composed during his education at the Jesuits' College. Like his brother he began by imitating the Spanish dramatists, and in the course of his career produced no less than forty-two pieces, tragedies and comedies. Nothing could exceed the popularity of some of his plays, which, however, was but transient, as they have, with about two exceptions, been long forgotten. The works by which he is chiefly remembered are 'Le Comte d'Essex,' and 'Ariane,' both tragedies. The former is much censured for the ignorance which it displays of English history: the latter is commended for the character of its heroine: here, however, its merit ends; the rest of the *dramatis personæ* being mere nullities. On the death of his brother, Thomas Corneille took his place in the *Académie*, and contributed to the 'Dictionnaire:' he also assisted his friend De Vise in editing the 'Mercurie Galant,' a noted periodical, and became a member of the Academy of Inscriptions. He died at Andelys in 1709, having shortly before lost the use of his sight.

CORNELIAN CHERRY. [CORNACEÆ.]

CORNET, a commissioned officer in a regiment of cavalry. He is immediately inferior to a lieutenant, and his rank corresponds to that of an ensign in a battalion of infantry.

The word is derived from the Italian *cornetta*, signifying a small flag; and hence, both in the English and French services during the sixteenth and seventeenth centuries, it was applied not only to the officer who had charge of the standard, but to the whole troop, which seems then to have consisted of 100 men and upwards, and to have been commanded by a captain.

CORNET, a shrill wind instrument formed of wood, which seems to have been known from the earliest times, and continued in use till the latter part of the seventeenth century, when it was laid aside for the oboe. In the *Musurgia* of Luscinius is a rude wood-cut of the cornet; but it is represented in a more satisfactory manner in Mersenne's *Harmonie Universelle*, from which it appears that the instrument was blown by a mouth-piece, and that there were treble, tenor, and base cornets. The compass of the first was from A, the second staff in the treble, to E in alt. The last was bent in rather a serpentine form, and reached nearly five feet in length, therefore was deep in tone.

CORNET-STOP, in the organ, is an imitative treble-stop, consisting of five ranks of pipes, in organs on a large scale, each key of the instrument causing all the five pipes to sound at once. These are tuned to a given note, its octave, twelfth, fifteenth, and seventeenth, though the whole together produce the effect of a single note. This is a harsh stop, and is now only used in union with others; but formerly, compositions were written exclusively for it, called *Cornet Pieces*, which, happily, the present improved taste in organ-playing has proscribed.

CORNICE. [CIVIL ARCHITECTURE; COLUMN.]

CORNOUAILLES, a name sometimes given to the town of Quimper, capital of the department of Finistère in France; but more commonly appropriated to a district formerly constituting the domains of a Breton count, who took his title from it. Its extent is not clearly ascertained, some making it co-extensive with the diocese of Quimper; others also including in it the diocese of St. Pol de Léon. It is noticed here only from the coincidence of its name with that of a part of England (Cornwall), from which it is probable that many of the Bretons emigrated.

CORNS are in the first instance merely thickenings of the cuticle, generally of the toes, arising from continued pressure over a projecting portion of bone. While superficial, a corn is moveable, and retains the lamellated structure of the cuticle; afterwards it acquires a base, attaches itself more firmly to the subjacent parts, and becomes a complete corn. 'A bursa or bag of synovial membrane, similar to those bursæ which are of original formation, but of very small size, is formed between the thickened cuticle and the cutis; it is this combination of thickened cuticle with a subjacent bursa which constitutes a perfect corn.' Corns are either hard and dry, which is the case when they are situated externally; or they are soft, when situated between the toes. The inconveniences arising from corns are

generally slight; sometimes they are very serious. The bursa under a hard corn is apt to suppurate, and the inflammation, pain, and irritation, are excessive. Tight or improperly-shaped shoes being the primary cause of corns, shoes or boots fashioned to the natural shape of the foot must be worn, and the material of which they are formed should be soft and pliant. To avoid pressure upon a corn already existing, a portion of leather spread with diachylon or other emollient plaster having a hole in it corresponding with the size of the corn may be worn; or if the outer portion of the corn, which is quite insensible, be pared or scraped away, temporary relief is obtained. For a corn which has become very sensible, the application of lunar caustic or concentrated nitric acid is necessary; if there be reason to suspect the existence of an inflamed bursa containing pus, the outer portion must be cut away with the scalpel, and the bursa freely laid open, so that the matter may escape, which will give great relief. If a soft corn become very sensible, as it often does, without an abscess existing beneath, concentrated nitric acid should be applied. Bunions differ from corns, inasmuch as the part affected is generally of greater extent; a bursa is always connected with them, and when inflamed, serum is secreted, which, if pressure and all causes of irritation be avoided, is again speedily absorbed. If the bursa be much inflamed, leeches and fomentations are necessary; and should pus have formed, it must be let out. If the abscess do not speedily heal, nitric acid should be carefully applied to its inner surface. Extirpation of corns has been recommended, but it is not free from danger, and should never be attempted except by a very skilful and dexterous person. A wound or laceration of the tendons or fibrous structures around the joints, is sometimes followed by the most alarming symptoms, even by tetanus and death. Amputation of the toe has been practised. (See Sir B. Brodie's excellent Lecture on Corns and Bunions, *Medical Gazette*, 13th February, 1836.)

CORNU AMMO'NIS, the old Latin name for the now well known fossil shell, the Ammonite. These *Cornua Ammonis*, *Cornes d'Ammon* of the French, were so called from a fancied resemblance to the horns with which the head of Jupiter Ammon was sculptured. In the earlier times their origin was variously accounted for: some thought them petrifications of real rams' horns, taking the name above mentioned in a strict and downright matter-of-fact sense; others thought they were the curled tails of certain animals; some took them for petrified marine worms rolled up; others saw in them coiled serpents, whence they were called *snake-stones*. The legends of the saints invested them with a sacred interest.

Of thousand snakes, each one
Was changed into a coil of stone,
When holy Hilda pray'd.

And the prayer, we are told, was not only followed by petrification, but by decapitation. We believe that there is a similar tradition of St. Keyna, who, when she found herself in a wood at Keynsham, between Bath and Bristol, surrounded by serpents, changed them by the fervour of her devotions into headless stones. Nor were these opinions confined to the mere vulgar. Wormius described Ammonites as petrified adders. Langius considered them to be either the vertebræ of serpents or convoluted marine insects. These notions were not lost on the dealers; and there are few fossil collections which do not even now possess what was called a *perfect Cornu Ammonis*, that is, an Ammonite with a carved serpent's head ingeniously fitted on to the fossil shell by way of aperture. Our limits will not permit us to dwell on this fabulous part of the history of Ammonites further than to observe that other learned men, Torellus Sarayna, Frascatorius, &c., considered them as *lusus Naturæ*, formed by the plastic power of the earth. The ancients held them in high estimation as very sacred and of the highest value to the dreamer. Thus Pliny (*Hist. Mund.*, book xxxvi., c. 10), 'Hammonis cornu inter sacratissimas Æthiopiarum gemmas, aureo colore, arietini cornus effigiem reddens, promittitur prædivina somnia representare;' and even to the present time the Indians are said to ascribe extraordinary properties to them.

To the zoologist Ammonites are objects of great interest, and to the geologist they are of the utmost consequence. 'It is easy,' says Mr. Phillips, in his 'Guide to Geology,' (8vo. 1834) 'to see how important, in questions concerning the relative antiquity of stratified rocks, is a knowledge of Ammonites, since whole sections of them are characteristic

of certain systems of rocks.' (sec. 82.) Dr. Buckland (*Bridgewater Treatise*, p. 333,) thus comprehensively describes the range of these extinct cephalopodous mollusks: 'The family of Ammonites extends through the entire series of the fossiliferous formations, from the transition strata to the chalk inclusive.'

According to Mr. Owen's system (respiratory), the Ammonites form the fourth genus of his second family (*Ammonitidæ*) of his first order *Tetrabranchiata*, of the class *Cephalopoda*. For Mr. Owen's definition of the Ammonitidæ, see *CEPHALOPODA*, vol. vi., p. 428. M. De Blainville, in his 'Malacologie,' thus defines the shell of *Ammonites*.

Shell discoid, more or less compressed; whorls of the spire more or less evident; the aperture with borders a little widened or opened out (*evasés*); the partitions constantly sinuous; a dorsal siphon.

In the 'Additions and Corrections,' the author states that he had observed at M. Defrance's many beautiful individuals of different species of Ammonites, which had been generously communicated to M. Defrance by M. Deslongchamps, of Caën, which present their apertures in a very complete state, and which he has figured. M. De Blainville further states that he is satisfied that this aperture is not always widened, as he had stated after an English author, and that it is often even rather contracted. The most constant character, he adds, is, that the border or lip is swollen into a thick margin (*bourrelet*), which is very regularly symmetrical, as in other univalve shells; and that this border, often subauriculated or rather notched at its root, is remarkably sinuous on each side; so that it becomes necessary to add to the character of this genus—'aperture symmetrical, a little widened or contracted, the border or lip thickened into a margin (*bourrelet*), and often notched or sinuous and auriculated in a variable manner at the origin.' This addition, though correct to some extent, should not be taken for granted as a *general* proposition, for there are certainly exceptions. M. Rang makes the genus *Ammonites* (Bruguière) embrace the following genera: *Orbulites*, *Planorbites*, *Planulites*, of Lamarck; *Ellipsolites*, *Amalthea*, *Pelagusa*, *Simplegas*, of De Montfort; *Ammonelliptites* of Parkinson; *Ophiopomorphites* of Plott; *Globites*, *Ceratites*, and *Goniaticites*, of De Haan.

The following is M. Rang's definition:—

Animal unknown.

Shell discoid, with the spire convoluted on the same plane, either enveloping or not enveloping; whorls contiguous, partitions more or less lobated on their borders, with ramifications or digitations; last chamber occupying the whole of the last whorl of the spire.

M. Rang observes that M. Defrance and M. D'Orbigny have remarked a particular disposition in the form of the borders of the aperture of Ammonites; these borders are sometimes furnished with a margin which is thick and reflected outwards; at other times two elongated tongue-like processes, terminated in a point or digitated, extend from each of the sides; lastly, adds M. D'Orbigny, in some others, a third appendage is given off from the middle of the two tongue-like processes, and bends (*se replie*) over the entrance of the aperture.

M. Rang proposes three groups:—

1.

Those with an embracing spire (*spire embrassante*). Example, *Ammonites subradiatus*, &c.

2.

Those with a demi-enveloping spire. Example, *Ammonites Mantellii*, &c.

3.

Those with a spire entirely uncovered. Example, *Ammonites giganteus*, &c.

Having given this sketch of the opinions of the authors above quoted, it will be necessary to meet the question whether the Ammonites were external or internal shells. Cuvier and Lamarck thought that they were internal. The former says (*Règne Animal*, last edition) 'La petitesse de leur dernière loge peut faire croire que, comme la spirule, elles étoient des coquilles intérieures.' These are great names, but we must differ from them. Mr. Owen, in his arrangement above quoted, says, 'Animal unknown, presumed to resemble the Nautilus'—'shell external' 'the last chamber the largest and lodging the animal,' and this we think was the actual state of things. Dr. Buckland, in his 'Bridgewater Treatise,' says, 'The smallness of the outer chamber or place of lodgment for the

animal is advanced by Cuvier in favour of his opinion that Ammonites, like the Spirula, were internal shells. This reason is probably founded on observations made upon imperfect specimens. The outer chamber of Ammonites is very seldom preserved in a perfect state; but when this happens, it is found to bear at least as large a proportion to the chambered part of the shell as the outer cell of the Nautilus Pompilius bears to the chambered interior of that shell. It often occupies more than half, and, in some cases, the whole circumference of the outer whorl. This open chamber is not thin and feeble, like the long anterior chamber of the spirula, which is placed within the body of the animal producing this shell, but is nearly of equal thickness with the sides of the close chambers of the Ammonite.'

[*Ammonites obtusus*.]

From Dr. Buckland; *a, b, c, d*, outer chamber. It should be remembered that the specimen is apparently imperfect at the aperture. The siphon or tube of communication may be traced from *d*, where it opens into the last or outer chamber, along the edge of the section, *e, f, g, h, i*, to the very nucleus of the shell. The waved transverse lines represent the partitions of the chambers.

The large proportion of the outer chamber is very strongly marked in specimens of *Ammonites rostratus*, that have the aperture perfect or nearly so.

[*Ammonites rostratus*.]

'Moreover,' continues Dr. Buckland, 'the margin of the mature Ammonite is in some species reflected in a kind of scroll, like the thickened margin of the shell of the garden snail' (*bourrelet* of the French), 'giving to this part a strength which would apparently be needless to an internal shell. The presence of spines also in certain species (as in *Ammonites armatus*, *A. Sowerbii*) affords a strong argument against the theory of their having been internal shells. These spines, which have an obvious use for protection, if placed externally, would seem to have been

useless, and perhaps noxious, in an internal position, and are without example in any internal structure with which we are acquainted.

Mr. De la Beche has proved from the mineral condition of the outer chamber of Ammonites from the lias at Lyme Regis, that the entire body was contained in it, these animals having been suddenly destroyed, and buried in the earthy sediment of which the lias is composed, before their bodies had either undergone decay or been devoured by the then existing crustaceans. Dr. Buckland notices this in his treatise, and adds, that in the Ammonites in question, the outer extremity of the first great chamber in which the body of the animal was contained, is filled with stone only to a small depth (cut of *Ammonites obtusus*, *a* to *b*); the remainder of this chamber, from *b* to *c*, being occupied by brown calcareous spar, which has been ascertained by Dr. Prout to owe its colour to the presence of animal matter, whilst the internal chambers and siphuncle are filled with pure white spar. 'The extent of the brown calcareous spar, therefore, in the outer chamber,' continues Dr. Buckland, 'represents the space which was occupied by the body of the animal after it had shrunk within its shell at the moment of its death, leaving void the outer portion only of its chambers, from *a* to *b*, to receive the muddy sediment in which the shell was imbedded. I have many specimens from the lias of Whitby of the *Ammonites communis*, in which the outer chamber thus filled with spar occupies nearly the entire last whorl of the shell, its largest extremity only being filled with lias. From specimens of this kind we also learn, that the animal inhabiting the shell of an Ammonite had no ink-bag; if such an organ existed, traces of its colour must have been found within the cavity which contained the body of the animal at the moment of its death.'

Dr. Buckland very happily illustrates the different arrangements by means of which a union of lightness and strength is secured to the shell both from the external conformation and the mode in which the transverse plates are disposed; and as our limits will not allow us to enter minutely into the subject, we must refer the reader to the 'Bridgewater Treatise' for the interesting details, which show that a more perfect instrument for affording universal resistance to external pressure—an instrument in which the greatest possible degree of lightness combined with the greatest strength was required—could scarcely be imagined, and must confine ourselves to the doctor's summary. 'As the animal increased in bulk, and advanced along the outer chamber of the shell, the spaces left behind it were successively converted into air-chambers, simultaneously increasing the power of the float. This float being regulated by a pipe passing through the whole series of the chambers' (see the cut of *Ammonites obtusus*), 'formed an hydraulic instrument of extraordinary delicacy, by which the animal could at pleasure control its ascent to the surface or descent to the bottom of the sea. To creatures that sometimes floated, a thick and heavy shell would have been inapplicable; and as a thin shell inclosing air would be exposed to various and often intense degrees of pressure at the bottom, we find a series of provisions to afford resistance to such pressure in the mechanical construction both of the external shell and of the internal transverse plates which formed the air-chambers. First, the shell is made up of a tube coiled round itself, and externally convex. Secondly, it is fortified by a series of ribs and vaultings disposed in the form of arches and domes on the convex surface of this tube, and still farther adding to its strength. Thirdly, the transverse plates that form the air-chambers supply also a continuous succession of supports, extending their ramifications, with many mechanical advantages, beneath those portions of the shell which, being weakest, were most in need of them.'

Reinecke*, Von Buch†, Zieten‡, and De Haan§ are among the other moderns who have written treatises on this interesting genus, or have illustrated it; and much information will be found in the works of Parkinson,

Schlotheim, James Sowerby (*Min. Con.*), De la Beche, Phillips, and others.

The species are very numerous. De Blainville quotes Defrance for 120 species, adding that he (Defrance) asserts that there are no more, but inquiring on what Defrance rests his assertion. M. Brochant, in his translation of De la Beche's Manual, enumerates 270.

The method of arrangement is various by various authors; but we think that when the subject is better known than it is at present, the shape of the aperture, which varies considerably, ought to be considered a leading character.

[Ammonites with perfect mouths.]

* *Maris protogæi Nautilus et Argonautas vulgo Cornua Ammonis in agro Coburgico et vicino reperiundos descripsit et delineavit, etc.*, D. I. C. M. Reinecke. Coburgi, 1818, 8vo.

† Ueber die Ammoniten in den älteren Gebirgs-Schichten. Gelesen in der Akademie der Wissenschaften, am, i. April, 1830. 4to. *Recueil de Planches de Pétrifications remarquables*, par Leopold de Buch. Berlin, 1831, folio.

§ Specimen philosophicum inaugurale, exhibens monographiam Ammoniteorum et Goniatiteorum, etc. 1825. Lugduni Batav.

These cuts, which are copied from De Blainville, will not only give the reader some idea of the shape of the aperture, but also of the external appearance of the shell, while the following, from Dr. Buckland's *Bridgewater Treatise*, will convey a notion of the concamerations in some of the species. An internal view of a very simple form of these and of the siphon or pipe will be seen in the cut of *Ammonites obtusus*.

[*Ammonites nodosus*.]

Geological Distribution.—Professor Phillips, in his '*Guide to Geology*' (8vo. 1834), thus distributes the Ammonites among the different formations.

SUB-GENERA OF AMMONITES.

	Goniatites.	Ceratites.	Arietes.	Falciferi.	Amalthei.	Capricorni.	Planulati.	Dorsati.	Coronarii.	Macrocephali.	Armati.	Dentati.	Ornati.	Flexuosi.

In Carboniferous system .	..	..	..	..	..	..	..	..	..	..	..	..	..	..
In Primary strata . . .	..	..	..	..	..	..	..	..	..	..	..	..	..	..

Total, 223 species.

The strata termed primary in Professor Phillips's table are those which Dr. Buckland has included in the lower region of the transition series in his section. (*Bridgewater Treatise*, pl. 1.)

We are indebted to Dr. Buckland for forwarding to us several specimens of Ammonites and some orthocerata from the Isle of Man, where they were collected by Captain Benham in a small bay near Castletown, in a confined space

(of a few yards), about high water-mark, resting on clay slate. The rock in which they were found appears to be transition limestone imbedded in slate. The shells are converted into arsenical pyrites, and some of them are included in lumps of the same mineral.

Geographical Distribution.—As the Ammonites were evidently principal agents for keeping within bounds the mollusks, &c., the crustaceans, and perhaps fishes of the periods prior to the chalk formation, and belonging to the latter epoch, we should expect to find them widely distributed. Accordingly, they occur in Europe, Asia, and America in strata apparently of the same date. In some instances, the genera and even the species are identical. Dr. Gerard found in the Himalaya Mountains, at an elevation of 16,000 feet, *Ammonites Walcoti* and *Ammonites communis*, fossils that are found in the lias of Lyme Regis. M. Ménard met with one in the Maritime Alps at an elevation of 1500 toises. Their numbers must have been great. M. Dufresne informed Lamarck that the road from Auxerre to Avalon in Burgundy was absolutely paved with them. The individual agency too of some of these carnivorous instruments for preserving the balance of marine animal power must have been of no small importance. Lamarck says that he has seen Ammonites of two feet (French) in diameter. Mr. James Sowerby and Mr. Mantell record Ammonites in the chalk with a diameter of three feet; and Dr. Buckland states that Sir T. Harvey and Mr. Keith measured Ammonites in the chalk near Margate which exceeded four feet in diameter; and this in cases where the diameter could have been in a very small degree enlarged by pressure.

Dr. Buckland is of opinion that the Rhyncholites, or beak-stones, which occur so abundantly in the oolite of Stonesfield, in the lias at Lyme Regis and Bath, in the Muschelkalk of Luneville, &c., were the mandibles of Ammonites as well as of fossil Nautili, and there can be no reasonable doubt of the fact.

We must here close a subject on which we could say much; and we leave it the more willingly, because the student will find in Dr. Buckland's *Treatise* a full and copiously illustrated account of Ammonites, more especially as regards the varied properties of support and the hydraulic action of the siphuncle.* *Ammonites heterophyllus*, figured at plates 38 and 39, affords a beautiful example, as the Doctor observes, of the manner in which the mechanical strength in each transverse plate is so disposed, as to vary its support in proportion to the different degrees of necessity that exist for it in different parts of the same shell.

CORNUCOPIA, or **CORNU-COPIÆ**, the horn of plenty, fabled to have had its origin in the infant days of Jupiter. Ovid, in his '*Fasti*' (lib. v. 115-128), tells us that one of the goats of Amalthea, who nursed Jupiter in Crete, broke off its horn against a tree, when the nymph, having wreathed it with flowers and filled it with fruit, presented it to the god. Jupiter, when he came into power, called his nurse to the skies, and made the horn the emblem of fertility. The Greeks called it κέρας Ἀμαλθείας, the horn of Amalthea. In his '*Metamorphoses*' (lib. ix. v. 82, &c.), Ovid derives the origin of the Cornucopia from a different fable. He speaks of it as the horn of the river god Achelous, broken off by Hercules, and consecrated by the Naiads:—

'Naiades hoc, pomis et odore flore repletum,
Sacrarunt.'

The Cornucopia occurs very frequently in the types of ancient coins, particularly upon those of Sicily. (See the medal of ARSINOË.)

CORNUS. [CORNACEÆ.]

CORNWALL, an English county, forming the south-west extremity of the island of Great Britain. The form of the county approaches that of a right-angled triangle, of which a line about seventy miles long, drawn E.N.E. and W.S.W. from Penlee Point at the entrance of Plymouth Sound, to the Land's End, may be regarded as the base; another line, forty-two miles long, drawn N.N.W. and S.S.E. from Penlee Point to the north-east corner of the county, as the perpendicular; and a line eighty-one miles long, drawn north-east and south-west from the last-mentioned point to the Land's End, as the hypotenuse. The area of the county, exclusive of the Scilly Isles, is 1330

* Geology and mineralogy considered with reference to natural theology, by the Rev. William Buckland, D.D., &c., &c., London, 1836, 8vo. See vol. i., p. 333 to 357, and vol. ii., plates 35 to 42.

square miles, being rather less than the area of the triangle above described. Cornwall lies between $49^{\circ} 55'$ and $50^{\circ} 55'$ N. lat., and $4^{\circ} 9'$ and $5^{\circ} 42'$ W. long.

The only county with which Cornwall is conterminous is Devonshire, which bounds it on the east (or rather on the E.N.E.): on all other sides it is surrounded by the ocean. The north-west coast is high and rocky. Tracing it from the border of Devonshire, it runs south by west, and forms two very shallow bays (Bude Bay and Widemouth Bay), succeeded by the headlands, Dazard Point, Castle Point, Penkenner Point, and Carnbeak. From Carnbeak the coast runs south-west, and forms several headlands, Tintagell Head being the principal; and several small bays as far as Pentire and Stepper Points, near the mouth of the river Alans or Camel, the entrance of which forms the haven of Padstow. A few miles W.S.W. of these is Trevoze Head, the most prominent headland on this side of the county: this is succeeded by Constantine, Watergate, and Towan bays, Towan Head, Fistal, Cranstock, and Holywell bays, Penhale Point, Ligger or Piran Bay, and St. Ives' Bay, Gurnard's Head, Cape Cornwall, Polpry and Peden-Mean-Due points, the last of which is less than a mile from the Land's End. The general direction of the coast from Trevoze Head to Cape Cornwall is south-west; from Cape Cornwall to the Land's End due south. Along this side of the county are scattered several islets and insulated rocks, but nothing that is worthy of notice. Off the Land's End are the Scilly Islands, a numerous and not unimportant group. [SCILLY ISLANDS.]

The coast from the Land's End to Plymouth Sound is marked by bolder promontories and deeper bays: it possesses for the most part the same character as that just described, but there are more frequent intervals of low and shelving beach. From the Land's End to Mount's Bay, the coast forms a line convex to the ocean, broken by a number of small headlands with intervening coves. Mount's Bay takes its name from St. Michael's Mount, a remarkable insulated rock opposite the town of Marazion, and connected with the main land by a causeway over the sands: Cuddan Point forms the eastern boundary of the bay. From Cuddan Point the coast runs south-east to the Lizard, the most southern point of England: and from thence turning north-east, forms the headlands of Innis Head, Black Head, Chynals Point, Dranna Point, Nare Point, Rosemullion Head and Pendennis Point, which last two form the extremities of Falmouth Bay. Between Nare Point and Rosemullion Head is the wide æstuary of the Helford river. Between Pendennis Point and Zone or St. Ann's Point (the next important headland) is the wide æstuary of the Fal, known by the name of Carrick Road, of which Falmouth harbour and St. Mawes harbour are branches. From Zone Point the coast still runs north-east to Greber Head, forming Gerrans, Veryan, Megavissey, St. Austell and St. Blazey bays, with the intervening headlands Pennare Point, Dodman or Deadman Point (379 feet high), Chapel Point, and the Black Head. From Greber Head the coast runs east to the Rame Head and Penlee Point (which is the entrance of Plymouth Sound), forming Looe and Whitesand bays. The rocks and islets along this coast are too unimportant to require notice.

Launceston, which has commonly been considered as the county town, is on the eastern border of the county; but Bodmin, which has a better title, is more central: it is about 210 miles from London in a direct line W.S.W., or 235 miles by the road through Salisbury, Dorchester, Exeter, and Launceston.

The population of the county by the census of 1831 was 300,938, including the Scilly Islands, or 298,473 without them; the latter number, compared with the area of the county as stated above, gives about 224 inhabitants to a square mile: which is considerably under the average of England and Wales, and still more under the average of England alone. (*Arrowsmith's Map of England and Wales; Ordnance Map; Population Returns for 1831; Paterson's Roads.*)

Surface, Hydrography, Communications.—From the central part of Cornwall, which is the highest, the land slopes towards the sea on each side. The whole surface of the county is irregular. The great post-roads pass over the central high ground, which, being for the most part waste moorland, give travellers a more unfavourable opinion of the soil, than, taken altogether, it deserves: for, in many parts, it is pleasingly diversified by hill and dale; some of

the valleys are beautifully picturesque, presenting corn and meadow land, wood and water. On the northern coast the land is generally high, with short narrow valleys: on the south coast the valleys are wider. The central ridge approaches, on the border of Devonshire, the N.W. coast: the streams that flow from its S.E. side have consequently a longer course, and are the most considerable in the county. The height of some of the hills is considerable, but they have not generally striking or picturesque forms, except where they extend down to the coast, and form abrupt headlands, as at Tintagell, Cape Cornwall, and the Land's End. The principal elevations are—Brown Willy, at the source of the river Fowey, 1368 feet; Carraton, or Caradon Hill, north of Liskeard, 1208 feet; Kit Hill, on Hingeston Down, near Callington, 1067 feet; Hensbarrow Down, north-west of St. Austell, 1034 feet; Cadon barrow, near Tintagell, 1011 feet; Carnmarth, south-east of Redruth, 849 feet; Carnmenelez, Carn-Menelis, or Carbonellis, south of Redruth, 822 feet; Carnminnis, south-west of St. Ives, 805 feet; Carn-Brea, south-west of Redruth, 697 feet; Pertinney, near the Land's End, 689 feet; Bindown, between East Looe and Liskeard, 658 feet; Bodmin Down, south-west of Bodmin, 645 feet; St. Agnes Beacon, near St. Agnes, 621 feet; St. Stephen's Down, north of Launceston, 605 feet; the town of Launceston, 591 feet; St. Buryan, near the Land's End, 415 feet; the town of Redruth, 414 feet; Maker Heights, on Plymouth Sound, 402 feet; and Sennen, near the Land's End, 387 feet. The above elevations are, with one or two exceptions, from the 'Ordnance Survey.'

The principal rivers of Cornwall are the Tamer, with its tributaries; the Fawey, or Fowey; the Fal; the Alan; the Seaton; the Looe; the Hel, or Helford; and the Heyl. The Tamer rises in the moors which form the north-east point of the county, and extend into Devonshire; and flows south-south-east into Plymouth Sound, forming, almost throughout its course, the boundary between Cornwall and Devonshire. It has no tributary worthy of notice, until it reaches the little village of North Tamerton, where it receives two large streams, the Deer and the Claw, from Devonshire. Lower down it receives a more considerable stream, to which in the 'Ordnance Survey' no name is given, but which Messrs. Lysons designate as the river Werington, from a village near its banks. The Attery, a smaller river, which flows by Launceston, falls into the Tamer, about a mile below the Werington; and about the same distance below that the Tamer is joined by the river Lyd, from Devonshire, and a few miles farther down by the river Inny, from Cornwall. Below the junction of the Inny the course of the Tamer, hitherto tolerably straight, becomes more sinuous, especially where it skirts the base of Hingston Down. The bed of the river then widens, and it becomes an æstuary, or tide-water. Near its mouth it receives the Tavy, from Dartmoor forest; and the Lynher or St. German's river from the downs between Launceston and Bodmin. The whole course of the Tamer is about 56 miles; viz. 24 from the source to the junction of the Attery, just below which it becomes navigable; about 21 from thence to the point to which the tide flows; and about 11 miles of tide-water, including Hamoaze, which is the harbour of Plymouth, or rather of Devonport. The length of its principal Cornish tributaries is as follows: the Werrington, about 17 miles; the Attery, about 10; the Inny, about 18; the Lynher, about 22; and the Tidi, a feeder of the Lynher, 9 or 10 miles.

The Fawey or Fowey rises on the east side of Brown Willy, to the right of the high road from Launceston to Bodmin. It flows south-south-east for several miles, and then turning westward receives on the right the rivers St. Neot's and Warleggan, besides a number of brooks: it then turns south, and passing Lostwithiel, falls into the sea at the borough of Fowey. It is not navigable above the point to which the tide flows. Its whole length is about 30 miles; the tide flows about 5 miles up; formerly it flowed higher up.

The Alan or Camel (*i. e.* the Crooked River) rises about 3 miles north-north-east of Camelford, and flows south-by-west past Camelford, until it is joined by the river De Lank, which rises near Brown Willy, and flows through a marshy valley. From this junction the course of the Camel is rather more to the south-west, until it is joined by the united waters of two brooks from the south and south-west: afterwards it flows north-west to Padstow, a little below

which it falls into the sea between Pentire Point and Trevoze Head, on the north-west coast. Its whole course is about 28 miles, of which about 7 are navigable from the tide flowing up. It receives a considerable tributary (10 to 12 miles long) about 2 miles above where the navigation commences. The mouth of the Camel forms a harbour for ships of 200 tons.

The Fal rises in Tregoss Moor, near the high road from Bodmin to Truro; and flows south, or south-by-west, to Grampound and Tregony, receiving by the way the water of a number of brooks. From Tregony it flows south-west 5 or 6 miles into the Mopus Road formed by the waters of St. Clement's Creek, which rises near St. Michael or St. Mitchell, and flows south-by-west, and of the rivers St. Allen, Kenwin, and another, which meet at Truro, just before they join St. Clement's Creek. From its junction with the Mopus Road the Fal flows southward into Carrick or Carreg Road, where it is joined by a river from the neighbourhood of Redruth. Falmouth Harbour is an inlet of Carrick Road on the west side; St. Mawes Harbour is another inlet on the east Road. The whole course of the Fal is probably about 25 miles, of which more than half is tide-water; the tide also flows up St. Clement's Creek for some distance, up the united channels of the Saint Allen and the Kenwin, as far as Truro, and up Falmouth Harbour as far as Penryn. Vessels of 100 tons can get up to Truro and Penryn. Carrick Road, with its inlets, is reckoned one of the finest harbours in Great Britain.

The Seaton and the Looe are two small rivers, rising not far from Liskeard, and flowing south into the sea: the former on the east, and the latter on the west of the town of Liskeard: the Seaton, which is the longer of the two, is rather more than 10 miles long. The Looe, which falls into the sea between the towns of East Looe and West Looe, is joined near its outfall by the Black Looe. The tide flows for a short distance up both these streams. Another river of nearly similar name (the Loo) which runs by Helston, forms a lake or pool immediately below that town.

The Hel or Helford is a small river, remarkable only for its large æstuary, which penetrates about 4 or 5 miles inland, nearly half the length of the river: the mouth of the Hel is between Nare Point and Rosemullion Point, near Falmouth. The river Heyl, which falls into St. Ives Bay, is about as long as the Hel, and has also a large æstuary. It is indeed only their tide-waters that render the Cornish rivers of any account as means of communication. Except the Tamer, they are not navigable above the point to which the tide flows. The æstuary of the Hel forms a haven for vessels of 200 tons; that of the Heyl, owing to a bar at the mouth, is accessible only to sloops of 50 or 100 tons burthen.

Cornwall has four navigable canals. The Bude and Holsworthy canal, part of the course of which is in this county, runs eastward from Bude Haven, to near the channel of the Tamer; from which point the Bude and Launceston Canal branches off to the south-south-east to Launceston. The chief object of these canals is to facilitate the introduction of Welsh coal, and the carrying of shelly sand from the coast to the interior, to be used as manure. The Liskeard and Looe canal runs south from Liskeard to the æstuary of the river Looe, and is designed to facilitate the transport of timber, coal, manure, and the mineral products of the district. A canal extends about 5 miles east and west from near St. Columb Major to Mawgan Porth, on the coast near Towan Bay: it was intended for the export of minerals, and conveying manure to the adjoining lands, but was never completed, and its channel is now partly filled up.

The mail-road from London to Falmouth passes over a considerable part of the county: it enters it by Poulston bridge, over the Tamer, not far from Launceston, and runs south-west by Launceston, Bodmin, and Truro. A road branches off to the right from this at the village and ex-borough of St. Michael's, and another at Truro; these, uniting at Redruth, proceed by Marazion, or Market Jew, and Penzance to the Land's End. Two other branches run from the neighbourhood of Penryn, and one from Penryn itself, unite not far from that town, and proceed by Helstone to Marazion, where they join the road to the Land's End. Another road from London by Exeter and Tavistock crosses the Tamer at New Bridge, and runs south-west by Callington, Liskeard, and Lostwithiel, St. Austell, and Grampound, to Truro. A branch road from Launceston runs in a circuitous direction by Camelford and

Wadebridge to St. Columb: and a road along the coast runs from Mount Edgecumbe or Plymouth Sound to East and West Looe and Fowey. The mail-coach roads are very good.

Geological Character.—The rocks which predominate in Cornwall are among the lowest in the arrangement of the strata of our island, and belong to the primitive and transition classes. The high land which occupies the centre of this peninsular county, and extends from between Launceston and Bodmin on the north-east to the Land's End on the south-west, is composed of granite, which in several extensive districts rises to the surface. The highest parts of this ridge are towards the north-east, and the elevation gradually diminishes towards the south-west; the height at which the granite is found on the surface also diminishes. The granite cliffs of the Land's End are not more than fifty or sixty feet high. Occasional veins or shoots from this granite formation penetrate northward and southward into the superincumbent strata; but they do not generally extend far from the principal masses of granite, nor are they insulated. It may be observed, that the eminences which are formed of granite commonly have their north-east side more abrupt than the south-west. The granite of Cornwall contains numerous metallic veins, both of copper and tin. It is liable to decomposition, to which cause is ascribed the existence of a tract of loose white kaolin or porcelain earth, some miles in extent, near St. Stephen's, between Bodmin and Grampound, and on the south side of the granite range: it is sent to Worcestershire. The decomposition of granite has probably formed those singular phenomena which were once regarded as relics and memorials of druidical superstition, the Logan or Logging Stone, Cheese-wring, &c. St. Michael's Mount, in Mount's Bay, is chiefly composed of granite, split into irregular masses. The fissures which are found in the Cornish granite have led many to suppose that it was stratified; but the supposition is now generally rejected. Granite is termed by the Cornish miners *Grouan*.

The rock commonly reposing on the granite is the *killas* of the miner, the clay-slate of geologists. It appears to have been erroneously designated *grauwacké* in the Survey of the Geology of Devonshire and Cornwall, by Dr. Berger, in the 'Geological Transactions,' vol. i. pp. 93 et seq. *Grau-wacké* is found, indeed, accompanying the clay-slate, but not to any great extent. On the south or south-east side of the granite formation, the strata dip south-east at an angle of about seventy degrees; on the opposite side of the granite formation the dip is nearly north-east. The *killas* is traversed by veins or dykes of porphyritic rocks, termed by the miners *Elvan*. These dykes (or channels, in the language of the miners) are rarely found in the granite; their general direction on the surface is east and west, or rather, according to Mr. Greenough's Geological Map, north-east and south-west; they vary from a few fathoms to fifty and even eighty fathoms in thickness; and in some cases are continuous through a long tract of country. The metallic veins, both of tin and copper, commonly pass through them, but are for the most part narrower when in the *Elvan* than when in the superincumbent and subjacent rocks. Roofing slate is quarried in this formation (the *killas*) near Tintagell Head. What is termed granite of the newer formation, but which is not true granite, is found in Cornwall resting on the clay-slate. A substance approaching to gneiss sometimes intervenes between the granite and the clay-slate.

The metallic veins which contain copper or tin, or both, run usually east and west, and penetrate both the granite and clay-slate; those which contain lead, silver, cobalt, or antimony, run north and south, with little exception, and are believed to be always in the clay-slate.

The Lizard Head and the neighbouring country are composed of serpentine: the relative geological position of this rock and the clay-slate has not been ascertained. The serpentine is accompanied by other rocks, mica slate, diallage, metalloïde, and greenstone. Near the Lizard it incloses veins of soap stone, which, when first raised, is so soft that it may be kneaded like dough, but becomes friable after being exposed to the air; it is used in the manufacture of porcelain. The serpentine incloses and passes into asbestos, and small quantities of native copper have been found in it.

Thin beds of limestone are found in Cornwall, alternating with *killas*, or clay-slate; it is of a blue colour, and contains veins of calcareous spar.

Copper and tin are the most important minerals of Cornwall. The extent of the metalliferous veins is unknown, as well as the depth to which they extend: no miner has yet seen the end or bottom of a vein. Their width varies much, from the thickness of a sheet of paper to thirty feet; but they are usually from one to three feet in thickness. The ores of copper or tin do not often occur together in the same vein at any great depth. If tin be discovered first, it sometimes disappears, after sinking 100 feet more, and is succeeded by copper; in others, tin is found to the depth of 1000 feet beneath the surface, almost without a trace of copper; if copper be first discovered, it is very rarely, if ever, succeeded by tin. It is seldom that either ore is found nearer to the surface than 80 or 100 feet. If a copper vein meets one of tin, it usually passes through it, and heaves it out of its course. The veins not metalliferous usually pass through the tin and copper veins, or lodes, as they are termed: these non-metalliferous veins have their course usually north and south.

The copper and tin mines, excepting some mines, chiefly of tin, near Callington, are south-west of the rivers Alan and Fowey. The chief mining district extends from St. Agnes on the north coast by Redruth to the neighbourhood of Helston and Marazion; and some mines are worked west of Marazion. St. Austell is in the centre of another but less extensive mining district near the south coast. (*Transactions of Geological Society; Phillips's Selection of Facts as to the Geology of England and Wales; Greenough's Geological Map of England and Wales.*) Some of the more remarkable natural curiosities of the county will be noticed under a subsequent head.

The lead-mines of Cornwall are not numerous, though the ore has been discovered in many parts of the county. Some silver is obtained from the veins of lead, and from a copper mine called Huel Mexico, between St. Agnes and St. Michael. Iron ore is also obtained, and shipped to Wales. Zinc, antimony, cobalt, and arsenic are procured, as well as some other of the semi-metals. Freestone of different qualities is quarried.

Agriculture.—Cornwall, being situated between two seas, is more subject to variations of weather than most other counties; the mountains attracting the clouds, charged with moisture, which the prevalent west winds bring from the Atlantic. From this cause, the harvest is not in general so early as in the more inland counties, which are in a more northern latitude by two or three degrees. The soil of the mountainous districts is extremely barren and unproductive; but in a few of the vales a tolerably rich soil is found, well adapted to the growth of corn, roots, and artificial grasses. The substratum of the whole county being rocky, and slate being the predominating rock, the surface consists chiefly of an argillaceous earth produced by the decomposition of the slate, mixed with various portions of vegetable matter accumulated in the course of ages. This soil is not naturally stiff or retentive of moisture, but rather a loose and porous soil. Excess of wet will sometimes convert it into a soft mud, where the substratum is not sufficiently porous to allow the water to percolate freely; but generally the land is not of a cold wet nature, like the clays in the midland counties. The most fertile lands are found from Endellion to St. Columb, on the north coast, in the peninsula which terminates in the Lizard Point, the neighbourhood of Burian and St. Germain's, the lands near the Fawey, and a great part of the hundred of Stratton. The rest of the county is comparatively barren. As may be expected from the nature of the soil, there is no great extent of natural meadows, and the want of them is made up by laying down part of the arable land with artificial grasses. This, however, is not done in the perfect and profitable manner adopted in the northern part of Britain; but the second or third crop of corn has grass-seeds sown amongst it when the land is nearly exhausted and full of noxious weeds. The scanty pasture thus produced is neither profitable to the farmer, nor does it serve to restore much fertility to the soil. The system of paring and burning the surface is adopted after the land has been some time in pasture; and with the help of sea-sand, which contains a great portion of comminuted shells, sea-weed, lime, and occasional manuring with pilchards, the land is brought into a state in which it may bear two or three moderate crops of corn. This at least is the old Cornish and Devonshire system, and is still adhered to by many.

Amongst the varieties of grain raised in Cornwall, we may notice the naked barley, which is there called *Pillez*. It is sown in the western part of the county for the purpose of fattening pigs and poultry, and likewise for making gruel to fatten calves. It bears nearly the same price as wheat. If the word be of Cornish origin, as is asserted, meaning *bald*, it would indicate that this variety of barley, highly praised by the French agriculturists under the name of *orge pillet*, has been originally introduced into France from Cornwall. It is highly productive, and well worthy of being introduced into other parts of the country.

The soil and climate of Cornwall are peculiarly favourable to the growth of potatoes, of which two abundant crops are sometimes produced in one season, an early crop taken up in June, and a second in October. The early crop has been known to produce 100 sacks per acre, and the second or main crop twice that quantity. This of course was in a deep and highly-manured soil. In many leases the farmer is restricted from growing potatoes except for his own use, than which nothing can be more absurd, as it deprives the farmer of a means of paying a higher rent, and cultivating his farm to advantage. The only condition should be the purchasing lime and manure in proportion to the potatoes raised and sold.

The principal cattle in Cornwall are of the Devonshire breed. The old Cornish breed, which was a small black mountain breed, is nearly extinct, as are likewise the small Cornish sheep: they have been superseded by better breeds. In no county are oxen more generally used for the plough than in Cornwall. Horses were formerly used only to carry loads on their backs. Good roads and the use of carts and waggons are comparatively new improvements, and by no means general. But there is a very simple and light wain peculiar to this county, which is deserving of notice. It has no sides like a waggon, but hoops over the wheel to keep the load from impeding their motion. It has some distant resemblance to the light waggons used in the mountainous part of Switzerland. The implements of husbandry are either of a rude construction or adopted from other districts. The Cornish plough is simple, and has a straight mould-board: where four or six oxen are put to a plough, the draught is not much considered. To prevent the breaking of the beam, in case stones are met with under the surface, the oxen are attached by a wooden pin, which breaks on any sudden check, acting as a kind of safety-valve.

Leases are generally for three lives, renewable on the death of one of the lives by paying a fine; a kind of tenure between a renter and a proprietor. A term of years is preferable, as being more certain. Farms let at rack-rent are let for seven, fourteen, and twenty-one years, as in other counties.

The county is rather bare of trees. Forests probably once existed, but they have now disappeared. Young plantations are much exposed to the sea winds, except where sheltered in valleys. Many proprietors, however, have planted on a large scale; and forest trees are beginning to rear their heads on many eminences, to the great improvement of the face of the country.

In the mining districts the land is naturally barren; but many spots have become clothed with verdure, and are cultivated by the miners, to whom spots of barren soil have been let at a low rent, on condition of their building habitations for themselves and families.

Improvements in agriculture are chiefly introduced by proprietors who occupy their own land. The common farmers, who are not men of capital nor enterprise, prefer following the routine of their forefathers. Large commons give a facility for keeping cattle without much expense, and this is seldom favourable to an industrious cultivation of arable land.

The county is however advancing slowly but steadily towards an improved system of cultivation.

The following are the principal fairs held in Cornwall:—Bodmin, January 25; Saturday after Midlent Sunday; Saturday before Palm Sunday; Tuesday and Wednesday before Whit Sunday; Dec. 6. Bolingey, March 16. Boyn-ton, Aug. 18. Boscastle, Aug. 5; Nov. 22. Camborne, Feb. 24; March 7; Whit Tuesday, June 29; Nov. 11. Camelford, Friday after March 10; May 26; July 17; Wednesday after Michaelmas-day. East Looe, Feb. 13; July 10; Sept. 4; Oct. 6. Falmouth, Aug. 7; Oct. 10. Five

Lanes, Monday week after Jan. 24; last Thursday in October. Fowey, Shrove Tuesday; May 1; Sept. 10. Gram-pound, Jan. 18; June 11. Goldwithney, Aug. 5. Gweek, nearest Monday to Feb. 20; June 1; nearest Wednesday to Aug. 7; Sept. 22; Oct. 2. Helstone, Saturday before Midlent Sunday; Saturday before Palm Sunday; Whit Monday; July 20; Sept. 9; Oct. 28; Second and Third Saturday before Christmas Eve. Kellington, May 4; Sept. 19; Nov. 12. Kilhampton, Holy Thursday; Three weeks after Aug. 26. Launceston, First Thursday in March; Third Thursday in April; Whit Monday; Old Michaelmas-day; Nov. 17; Dec. 6. Liskeard, Shrove Monday; Monday before Palm Sunday; Holy Thursday; Aug. 15; Oct. 2. Lostwithiel, July 10; Sept. 4; Nov. 13. Marazion, Sept. 29. Menheniot, April 23; June 11; July 28; First Friday in December. Padstow, April 18; Sept. 21. Penryn, Wednesday after March 6; May 12; July 7; Dec. 21. Penzance, March 25; Thursday after Trinity Sunday; Sept. 8; Thursday before Advent Sunday. Redruth, Easter Tuesday; May 2; Oct. 12; Nov. 3. St. Austell, Maundy Thursday; Whit Thursday; First Friday after July 23, and Oct. 16; Nov. 30. Saltash, Feb. 2; July 25. St. Blazey, Feb. 2. St. Columb, Thursday after Midlent Sunday; June 9; Thursday after Nov. 12. St. German's, May 28, Aug. 1. St. Ives, Saturday before Advent. Stratton, May 18, Nov. 8; Dec. 11. Summercourt, Holy Thursday; July 28; Sept. 25. St. Laurence, Aug. 21; Oct. 29. Tregony, May 3; July 25; Nov. 6. Treganatha, May 6; Aug. 6. Truro, Wednesday in Midlent; Whit Wednesday; Nov. 19. Wadebridge, May 12; June 22; Oct. 10. Week, St. Mary, July 29; Sept. 15; Wednesday before Christmas-day. West Looe, May 6.

Divisions, Towns, &c.—Cornwall was formerly divided into seven hundreds—Conarton, Fawiton, Pawton, Rialton, Stratton, Tibesta or Tibesterna, and Winneton or Winnenton. There are now nine hundreds; Stratton hundred and East hundred, on the east along the bank of the Tamer; Lesnewth and West hundreds, to the west of these; Trigg hundred, to the west of Lesnewth; Pyder and Powder hundreds, west of Trigg and West hundreds; and Penwith and Kerrier at the western end of the county. In the above enumeration, when two hundreds are mentioned together, the most northerly is named first. According to Dr. Borlase, it is not easy to discover the limits of the antient divisions, or to reconcile them with the present. He considers that Conarton included the modern Penwith, and Tibesta the modern Powder; Winneton the modern Kerrier, and Stratton the modern Stratton, Lesnewth and Trigg; Fawiton the modern East and part of West; Pawton, the remainder of West and part of Pyder, and Rialton the rest of Pyder.

The number of parishes according to Camden is 161; according to others as mentioned by Carew, 180; the last population returns give 205, including the parish of Maker, which is partly in Devonshire, and also the parish of St. Mary, which comprehends the Scilly Isles; and counting as one the parishes of St. Erney and Landrake, which in the population returns are given as united.

The number of market towns is thirty, viz.:—St. Agnes, St. Austell, Bodmin, Boscastle, Callington, Camborne, Camelford, St. Columb Major, St. Daye, Falmouth, Fowey, Gram-pound, Helston, St. Ives, Launceston, Liskeard, East Looe, Lostwithiel, Marazion, St. Mawes, Mevagissey, Padstow, Penryn, Penzance, Polperro, Redruth, Saltash, Stratton, Tregony, Truro. Of these, St. Austell near the coast of the English Channel (population in 1831, 8758); Bodmin, near the centre of the county (pop. in 1831, 3782); Falmouth on Falmouth Haven (pop. of parish in 1831, 7284); Helston on the river Loo (pop. in 1831, 3293); St. Ives on St. Ives' Bay (pop. in 1831, 4776); Launceston on a feeder of the Tamer (pop. in 1831, 2231); Liskeard, between the Seaton and the Looe (pop. in 1831, 4042); Penryn near Falmouth (pop. in 1831, 3521); Penzance, near the Land's End (pop. in 1831, 6563); Redruth (pop. in 1831, 8191); Truro (pop. in 1831, 8468); are of sufficient importance to require notice in distinct articles.

St. Agnes is on the N.W. coast, in the hundred of Pyder, between Padstow and St. Ives, 260 or 261 miles from London by Salisbury, Dorchester, Exeter, Launceston, Bodmin, and St. Michael. It is a small town; the market, for which there does not appear to be any charter on record, has been held from time immemorial for all sorts of wares and provisions except corn. Thursday is the market day. The

parish comprehends an important mining district, and had a population of 6642, in 1831. There is a harbour at Trevenaunce, in this parish, which has been much improved of late years; the pilchard fishery has been established here since the beginning of the present century. St. Agnes was antiently called Breanick or Bryanick.

St. Agnes is a parochial chapelry, united with the vicarage of St. Perran-in-Zabulo or Piranzabuloe. The two are stated to produce 419*l.* net yearly revenue, and are in the gift of the dean and chapter of Exeter, in whose peculiar jurisdiction they are. In a dingle called Chapel Combe was an antient chapel called Porth Chapel, the ruins of which were taken down 1780; there are the remains of an antient chapel at Malow or Morlah, in the parish of St. Agnes. There are a free-school, a sunday-school, and three dissenting places of worship. Opie, the painter, was born at St. Agnes.

St. Agnes Beacon is on a pyramidal hill near the town, 621 feet above the level of the sea; it is formed out of an antient cairn or tumulus, and was used as a beacon during the alarm of invasion in the beginning of the present century.

Boscastle, (which name is a corruption of Bottreux castle,) is in the hundred of Lesnewth, and on the north-west coast, not far to the north-east of Tintagell Head. It is a poor little place, but in a very romantic situation. The castle from which it takes its name, is no longer standing. It has a weekly market.

This little town is partly in the parish of Forrabury, a rectory (net annual value 70*l.* with a glebe house), and partly in that of Minster, a rectory (net annual value 224*l.*), both in the diocese of Exeter and archdeaconry of Cornwall, and in the gift of T. J. Phillips, Esq. The joint population of the two parishes does not exceed 855. There is a pier at Boscastle, to which vessels come with coals. Near the market-place are the remains of an antient church or chapel, dedicated to St. James, also some remains near the church of Minster, (which is remote from the town) of a former cell of Black or Benedictine monks dependent upon an abbey at Angers in France.

Callington is in the hundred of East, and on the road from London by Tavistock to Liskeard, Lostwithiel, St. Austell, and Truro; 216 miles from London, and above 40 from Truro. The situation of the town is low and unpleasant, at the foot of Hingston Down, and not far from the Lynher, a feeder of the Tamer; and the buildings, with the exception of the church, are mean and unimportant; the houses are chiefly arranged in one broad street. The church, or rather chapel, was almost wholly rebuilt about the middle of the fourteenth century, by Nicholas de Asheton or Assheton, serjeant-at-law. Some cloth is manufactured here. There is a market on Wednesdays for corn and provisions. Some mines are worked in the neighbourhood. There are two dissenting places of worship. The population in 1831 was 1388.

Callington is a perpetual curacy, held with the rectory of Southill; their joint net annual value is 748*l.* with a glebe house; they are in the diocese of Exeter and archdeaconry of Cornwall, and in the gift of Lord Ashburton.

This was one of the boroughs disfranchised by the Reform Act. It was the last town in Cornwall admitted to the right of sending members, not having acquired that privilege till 1585.

Camborne is in Penwith hundred, and on the road from London by Redruth to St. Ives; 3½ miles from Redruth, and 265 from London. It is neatly built, in the midst of the mining districts: the country around affords some extensive and delightful prospects. The church is a fine specimen of the granite churches of this county, built in the perpendicular English style: there is a good south door under a porch, a modern south chapel, and a modern font. (Rickman's *Gothic Architecture*.) There are places of worship for different classes of Methodists. The market, established in 1802, is considerable; it is held on Saturday: the market-house was built by Lord De Dunstanville, of the parish. The population, in 1831, was 7699.

The living is a rectory (net annual value 790*l.* with a glebe house), in the diocese of Exeter and the archdeaconry of Cornwall, and in the gift of Lord De Dunstanville.

Camelford is in the hundred of Lesnewth, and on the road leading from Launceston by Wadebridge to Padstow, 228 miles from London, and 14½ from Launceston. It is described as an ill-built town, in a situation 'as dismal as

can well be imagined.' The streets, however, are broad and well paved; and there is a town-hall, which was built about 30 years since by the Duke of Bedford. The river Camel, which rises about four miles to the N.N.E., flows through the town, and gives name to it. The parish church is at Lanteglos, more than a mile south-west of the town. There is an endowed school. The population of the parish, in 1831, was 1359. There is a market on Friday for corn and provisions. The town was made a free borough by Richard, earl of Cornwall, better known by his subsequently acquired title of King of the Romans, brother of Henry III. The present corporation was incorporated by a charter of 25 Charles II. From the time of Edward VI. the borough sent two members to the House of Commons, who were elected by the corporation and a few freemen. Camelford was disfranchised by the Reform Act.

The living of Lanteglos is a rectory, united with the neighbouring rectory of Advent; their joint annual value is 474*l.* with a glebe house: they are in the diocese of Exeter and the archdeaconry of Cornwall: the patronage is in the king as duke of Cornwall. There was formerly a chapel in the town of Camelford; it is now in ruins. The petty sessions for the hundred are held here. The neighbourhood of Camelford is supposed by some to have been the scene of the battle in which King Arthur fell; and of another fought in 823 between the Britons and the West Saxons under Egbert.

St. Columb Major is in the hundred of Pyder, on a rivulet which flows into the sea between Trevoise Head and Towan Head, and a little to the right of the main road from London by Launceston and Bodmin to Truro; 246 miles from London and about 11 from Bodmin. It is a small place, but pleasantly situated, being on the slope of a hill which commands some interesting prospects. The buildings are antient, and the town for the most part ill paved. There is a spacious cross church, the interior of which exhibits some curious specimens of early workmanship and numerous monuments: there was formerly a chantry attached to this church. There are meeting-houses for the Wesleyan and Calvinist Methodists. There were in antient times four free chapels in the parish, which is very extensive, comprehending 11,680 acres, or more than 18 square miles. The population in 1831 was 2790. There is a market on Thursday, and, in the summer, one also on Saturday. The living, a rectory, is of the yearly value of 1296*l.* with a glebe-house: it is in the diocese of Exeter and archdeaconry of Cornwall.

St. Daye is in the parish of Gwennap, in the hundred of Kerrier: it is between Truro and Redruth; 261 or 262 miles from London, and about 2 miles from Redruth. It appears to have been of more consequence in former times, but had fallen much into decay: of late years it has greatly recovered, owing to the increase of the mining population in the neighbourhood. There was formerly a chapel, of which there are now no traces: this chapel is said to have been much resorted to by pilgrims in former days, and from the resort of these pilgrims arose a market, which continued to be held without any charter: this market was however given up. The present market, which is held on Saturdays for butchers' meat and other provisions, was established some years since for the benefit of the miners. The parish of Gwennap, which is rather large, contained in 1831 a population of 8539, principally consisting of miners.

The living of Gwennap is a vicarage (net annual value 482*l.* with a glebe-house) in the diocese of Exeter and archdeaconry of Cornwall, and in the gift of the dean and chapter of Exeter. There is near St. Daye a curious amphitheatre of rude construction, supposed to have been of British origin; it was selected by Wesley as a place for public preaching, and is still used by his followers at some of their anniversaries.

Fowey, in the hundred of Pyder, is on the right or west bank of the river Fowey, near its mouth, 240 miles from London, through Tavistock, Callington, and Liskeard, or 243½ miles through Plymouth and East Looe. The scenery around this town is very picturesque. The rocks about Polruan, on the opposite side of the river (which here expands into a good haven), rise to a considerable height, and are broken into rude cliffs and bold promontories. At the mouth of the haven are the ruins of two square stone forts or blockhouses, one on each side, built in the reign of Edward IV. to protect the entrance. They were provided with port-holes for cannon, and had apparently four floors:

the walls are six feet in thickness. The harbour is now defended by two modern batteries, and by a fort, called St. Catherine, which was built in the reign of Henry VIII. The town is built in a very straggling manner, the houses extend a considerable way along the haven, and the streets are so narrow and full of angles as to be almost impassable for carriages. Most of the buildings are of stone. The church is a spacious and lofty fabric of the perpendicular English style of architecture: it was rebuilt, or at least much altered about 1466. There was formerly in the town a chapel called St. Catherine's Chapel, which gave name to St. Catherine's Hill: it existed in Leland's time. There is a spacious market-house, with a town-hall over it, and a public walk overlooking the town and harbour.

The population of Fowey in 1831 was 1767. The chief business of the town consists in catching and curing pilchards: this fishery employs many vessels. Fowey is a corporate town; the corporation consists of a mayor, recorder, eight aldermen, and a town-clerk. Fowey sent members to parliament from the time of queen Elizabeth up to the passing of the Reform Act, by which it was disfranchised. The living is a vicarage, of the annual value of 179*l.*, with a glebe-house, in the diocese of Exeter and archdeaconry of Cornwall. There is a market on Saturday. There are two free-schools, and an almshouse for eight poor widows. The harbour has excellent anchorage, and is always safe.

Fowey was antiently a place of greater importance than it is now. The townsmen acquired wealth by feats of war and by piracy in the wars of Edward I. and III., and Henry V., and their wealth enabled them to increase the commerce of the town to a great extent. Fowey furnished more ships to the fleet of Edward III. before Calais than any other port in England, and more mariners than any other port except Yarmouth. About the same time the Fowey men had a sharp battle with the Rye and Winchelsea men, because they (the Fowey men) would 'vale no bonet, being required:' the Fowey men obtained the victory, and hence rose the name of 'the gallaunts of Fowey.' The French burnt the town in 1457. When peace was made between England and France in the time of Edward IV. the Fowey men still kept up hostilities, for which the king ordered their fleet to be confiscated. The possession of the town was repeatedly contested in the struggle between Charles I. and his parliament.

Grampound is in the parishes of Creed and Probus, in the hundred of Powder, 248 miles from London, by Tavistock, Liskeard, and St. Austell. The river Fal flows through the town, the greater part of which is to the east of that river, and consists of one main street on the declivity of a hill. The town did not contain in 1831 more than 113 houses, and 715 inhabitants. The parish church is at Creed, a mile from the town, but there is a small chapel of ease in the town, and a granite cross. The market is inconsiderable: it is held on Saturday. There is a corporation, consisting of a mayor, eight aldermen, a recorder, and town-clerk. Grampound sent members to parliament from the reign of Edward VI. until 1821, when it was disfranchised for bribery. The living of Creed (or St. Creed,) is a rectory of the net annual value of 351*l.*, with a glebe-house, in the diocese of Exeter and archdeaconry of Cornwall. Grampound has been supposed, but with little reason, to have been a Roman station.

East Looe is in the parish of St. Martin, in the hundred of West: it is on the left or east bank of the river Looe, which here falls into the sea; 234 miles from London by Plymouth. It is built on a flat piece of ground between the river Looe and the sea, and is described as a labyrinth of short narrow dirty alleys, above which rises the low embattled tower of a little chapel of ease. On the land side rises a high steep hill, over which the road leads into the town. East Looe is united with West Looe on the opposite side of the river by a bridge of thirteen, or, according to other accounts, fifteen arches: this bridge is 141 yards long, but only 6 feet two inches wide: there was formerly upon it a chapel or oratory dedicated to St. Anne. The number of houses in 1831 was 167: the inhabitants were 865. They are chiefly engaged in the pilchard fishery. The harbour, formed by the mouth of the river, admits vessels of 100 tons, and is protected by a battery of ten guns. There is a market on Saturday. The town was incorporated by Queen Elizabeth; the corporation consists of a mayor, recorder, and eight burgesses, and an unlimited number of freemen. It returned members to parliament

from the time of Elizabeth to the passing of the Reform Act, by which it was disfranchised. The election was in the mayor, burgesses, and freemen. There is an endowed free-school for teaching mathematics, especially those branches connected with navigation. There is an endowment of 27*l.* per annum attached to the chapel of ease, which is held with the living of St. Martin.

The living of St. Martin is a chapelry of the annual value of 48*l.*, with a glebe house, in the gift of the duke of Cleveland and the earl of Sandwich. It is in the diocese of Exeter, and the archdeaconry of Cornwall.

East Looe was formerly of much greater importance: it united with Fowey in sending a member to a council of trade held at Westminster in the reign of Edward I., and furnished 20 vessels and 315 men to the fleet of Edward III.

Lostwithiel (otherwise Loswithiel and Lestwithiel) is in the hundred of Powder, on the west or right bank of the Fowey, 234½ miles from London, by Tavistock and Liskeard. The number of houses in 1831 was 217, chiefly of stone, and covered with slate, of which large slabs are quarried in the neighbourhood. The streets are narrow and roughly paved. The church is a curious edifice, with a tower, in the early English style, and an octagonal lantern and spire of decorated English: there is a fine east window. The aisles are of later date. Within the church is a singular octagonal font. Near the church is an antient building said to have been a palace of the dukes of Cornwall. There is a town-hall, in which the Epiphany and Midsummer sessions for the county are held; the county members were also elected here until the division of Cornwall by the Reform Act. There are a grammar-school and a writing-school, supported by the corporation, and a school endowed by the trustees of Mr. St. John Eliot's donation. The market is on Friday. The population of the parish in 1831 was 1548: but the borough extends beyond it into the parish of Lanlivery.

The corporation of Lostwithiel consists of seven capital burgesses, one of whom is annually elected mayor, and seventeen assistants, or common-councilmen. The borough sent members to parliament from the time of Edward I. until it was disfranchised by the Reform Act.

The living is a vicarage of the net annual value of 96*l.*, in the diocese of Exeter and the archdeaconry of Cornwall.

Lostwithiel was made a free borough by Richard earl of Cornwall and king of the Romans. Edmund, earl of Cornwall, son of Richard, was also a great benefactor of this town, conferring upon it several important privileges, some of which however were lost upon his death. In the civil war of Charles I. and the Parliament, the Royalists under Sir Richard Grenville were defeated in a skirmish near Lostwithiel by the Parliamentarians. Restormel castle, in the parish, was however soon afterwards taken by Sir Richard Grenville, and the earl of Essex, commander-in-chief of the Parliamentarians, retired from Lostwithiel, where he had his quarters, to Fowey, where his infantry was obliged to capitulate, though on very favourable terms.

Lostwithiel is, by some antiquaries, considered to have been a Roman station: Camden and Borlase fix here the *Ουξελα* (Uxela) of Ptolemy, which later antiquarians fix on the Parret, in Somersetshire.

Marazion, or Market Jew, is in the hundred of Penwith, on the coast of Mount's Bay, 281 miles from London, through Exeter, Launceston, Bodmin, Truro, and Helston; and 15 miles from the Land's End. This town is built on the slope of a hill, which rises towards the north and shelters it from cold winds. The mildness of temperature which results from its situation, renders the town and neighbourhood inviting to invalids, though these advantages are partly counterbalanced by the quantity of rain. The town contained 260 houses in 1831, and had a population of 1393. The parish church (that of St. Hilary) is two miles distant.

There are two dissenting places of worship, if not more. This town was formerly of more importance than it is now. At present there is one market held on Saturday, and well supplied. Ready-made shoes are sold in considerable quantities. The chief trade of the town consists in the importation of timber, coals, and iron, for the use of the neighbouring mines. The origin of the popular name of this town, Market Jew, has been much disputed: some have supposed it had at an early period a market to which foreign Jews came to buy tin; others that the name was derived from a market held on Thursday (*die Jovis*); it more probably has arisen from a popular corruption of the antient name, which appears to have been variously written, Marchadyon, Mer-

dresein, Marghasyon, and Marghasiewe, from which last Market Jew seems to have sprung. It appears to have been burnt by the rebels under Humphrey Arundell of Lanherne, in 1549, and most of the public buildings and dwelling houses lay in ruins till long after.

Marazion has a corporation consisting of a mayor, eight burgesses, and twelve capital inhabitants. It appears to have elected two members of parliament in the year 1658, but it does not appear that they ever took their seats: it is thought to have had representatives at an earlier period.

The parish of St. Hilary, in which Marazion stands, had in 1831 a population of 1728, besides the population of the town, making 3121 in all: many of these are engaged in mining. The living is a vicarage in the diocese of Exeter and archdeaconry of Cornwall, of the net annual value of 311*l.*, with a glebe-house.

Opposite the town of Marazion is St. Michael's Mount, which is connected with the main land by the sands when the tide is out, but is insulated when it is high water. Across the sands is a narrow causeway of pebbles to render the communication more perfect. According to some antient traditions, the Mount was formerly attached to the shore, and surrounded with trees; but an examination of the geological features of the spot has shown that the traditions are groundless, and that the Mount could not have been separated from the land but by some great convulsion far beyond the reach of tradition or historical record.

It is supposed, and apparently with reason, that St. Michael's Mount was the *Ιετις* of Diodorus Siculus, the depôt for the tin refined and cast into ingots by the Britons. Previous to 1044 a priory of Benedictine monks had been established on the island; in that year Edward the Confessor gave to the monks the Mount, with all its appendages; but before 1085 Robert earl of Moreton (Mortagne?) and Cornwall, annexed it to the abbey of St. Michael in periculo Maris in Normandy. It was included in the suppression of the alien priories in the reign of Edward III., but restored as a religious house, and afterwards given, first by King Henry VI. to King's College, Cambridge, and then by King Edward IV. to the Brigittine nunnery at Sion, in Middlesex. At the Dissolution the lands belonging to this house were valued at 110*l.* 12*s.* The Mount is said to have been regarded with religious reverence as early as the fifth century. In the dark ages it was much resorted to as a place of pilgrimage. It was regarded also as a stronghold, and a castle was built on it. The Mount was seized and the monks expelled by Henry de la Pomeroy, who supported prince (afterwards king) John in his attempt to seize the throne during the captivity of his brother, Richard Cœur de Lion. It was however surrendered by Pomeroy on the approach of the royal army, supported by the sheriff with the posse comitatus: the monks were restored, and a small garrison placed in the castle. In the War of the Roses, the castle was seized by the earl of Oxford, a Lancastrian, after the battle of Barnet; the Yorkists besieged the place for several months, and at last took it by capitulation. Perkin Warbeck had possession of this castle for a while, and left his wife here as in a place of security. Upon the suppression of the monastery, the Mount was given to Humphrey Arundell of Lanherne: and when he placed himself at the head of the Cornish insurgents in 1549, the possession of this strong-hold was obstinately contested. In the civil war in the time of Charles I., the Mount was held for the royalists by Sir Francis Bassett, but was taken by the Parliamentarians in 1646. In Leland's time, there were houses at the foot of the Mount, with shops for fishermen; but before 1700 the place had so far decayed that there remained only one cottage, inhabited by a widow woman. In 1726-27 Sir John St. Aubyn rebuilt the pier, and since then the number of inhabitants has much increased. In 1831 there were 42 houses and 161 inhabitants; but in the pilchard season the number is generally increased. The Mount is extra-parochial.

The island, containing the Mount and a level piece of ground at its foot, is about a mile in circumference, and comprehends 70 acres of surface. The Mount is 231 feet in height from the level of the sea to the platform of the chapel tower. The ascent is steep, and is defended by two small batteries; the summit is occupied by the remains of the monastic buildings, which have been repaired and converted into a dwelling-house. Formerly the inhabitants had no other water than rain water collected in drains; but about the middle of the last century, on sinking a well, a fine spring

was found, at the depth of 37 feet. Specimens of tin ore are said to be very plentiful all over the Mount, which is principally composed of granite. Human bones are frequently dug up wherever the soil was deep enough to allow of interment.

St. Mawes is in the parish of St. Just, in Roseland, in the hundred of Powder, on an arm of the Carrick Road, an inlet of the sea on which Falmouth stands: it is 260 miles from London, through Tavistock, Liskeard, and Tregony. This is a wretched little place, consisting of one street under a hill by the sea, and containing a few houses inhabited by fishermen. There was neither church nor chapel until 1812, when the marquis (now duke) of Buckingham built one. The parish church of St. Just is distant two miles. There is a castle built by Henry VIII., nearly at the same time as Pendennis castle, on the other side of the roadstead, but much inferior to it in size; it is now used as a residence for the lieutenant-governor. The market, which is on Friday, is very small. St. Mawes returned two members from 1562 up to the passing of the Reform Act, by which it was disfranchised. The parish of St. Just contained, in 1831, 337 houses and 1558 inhabitants. The living is a rectory of the net annual value of 425*l.*, with a glebe house. It is in the diocese of Exeter and archdeaconry of Cornwall.

Mevagissey, in the hundred of Powder, is a small town on the coast of the channel, on Mevagissey Bay, several miles to the left of the road by St. Austell and Grampound to Truro and Falmouth, 250 miles from London. The parish, which is small, contained in 1831 340 houses, and 2169 inhabitants. In 1821 the population was 2450: the diminution is ascribed to the failure of the pilchard fishery, on which the inhabitants chiefly depended. Ships of 100 tons may ride securely in the pool or basin of Mevagissey. The market, which is held by prescription, is on Saturday.

The living is a vicarage, in the gift of the Earl of Mount Edgumbe; net annual value 186*l.*, with a glebe house. It is in the diocese of Exeter, and archdeaconry of Cornwall.

Padstow, in Pyder hundred, is at the mouth of the river Alan, or Camel, which here forms a wide æstuary; it is 246½ miles from London, by Launceston and Camelford. The town is in a vale, adorned with gardens on each side, and the beauty of the situation is increased by the æstuary, which, when the tide is up, presents a clear expanse of water apparently land-locked by the granite cliffs which form the banks. The harbour is the best on the northern coast of Cornwall, and, though the entrance is much obstructed by sand, is capable of receiving vessels of great burden. The streets are in general narrow, and many of the buildings antiquated; but the town has been much improved within the last half century by the erection of many new houses: the general roofing is a fine blue slate. There is an excellent pier, a custom-house, several quays and shipwrights' yards, a workhouse, and a school-room over it. The church is in the perpendicular style of architecture. There were formerly several chapels in this parish; the east wall of that of St. Saviour, on a precipice overlooking the town and harbour, yet remains. The number of houses in the parish in 1831 was 325; the population at the same period was 1822. In the time of Leland the town carried on a considerable trade both with Ireland and Wales; the chief imports now are coals and iron from Wales, timber from Norway, and various goods from Bristol: corn, malt, and block tin are exported. The market is on Saturday. There is a school endowed with 5*l.* per annum from the Rev. St. John Eliot's donations, two Sunday schools, and several day schools, established by voluntary subscription and private benevolence. (Lysons' *Magna Britannia*, 1814.) There is supposed to have been at Padstow a monastery founded by St. Petrock, about A.D. 520, and destroyed by the Danes in 981. The place appears to have had antiently the name of Adelstowe or Aldestowe, and in the Cornish language Lodenek.

The living is a vicarage, of the net annual value of 202*l.*, with a glebe-house. It is in the diocese of Exeter and archdeaconry of Cornwall.

Polperro, in the hundred of West, lies partly in the parish of Lansalloes and partly in that of Talland; it is on the coast between Plymouth and Fowey, 6½ miles from Fowey, and 237 from London. The situation of this little town is singularly romantic, the houses being on the side of two steep rocky hills, forming a very narrow valley; a small river which divides the two parishes runs through this

valley. There is a harbour for vessels of 150 tons; an extensive hook and line fishery is carried on, by which Bath, Plymouth, and other places are supplied with fish: there is also a pilchard fishery, and some trade is carried on in coals, limestone, and grain. There was formerly a chapel dedicated to St. Peter on the brow of the more westerly of the two hills in the parish of Lansalloes; there are some remains of this, called the chapel house. The market is on Friday. The population of Polperro is not given separately in the population returns. The two parishes in which it stands contained together, in 1831, 1725 inhabitants, exclusive of the borough of West Looe, which is in Talland parish.

Lansalloes is a rectory, of the net annual value of 395*l.*, with a glebe-house. Talland is a vicarage, of the net annual value of 110*l.*: both are in the diocese of Exeter and the archdeaconry of Cornwall. There are two endowed charity schools at Polperro; one for boys and one for girls.

Saltash is on the right bank of the Tamar, a little above its junction with the Lynher, and is in the parish of St. Stephens. The town is built on the ascent of a steep hill, the summit of which is crowned by the chapel of ease and the town or mayoralty hall, beneath which is an open market-place. The streets are narrow and indifferently built; the principal street is at right angles to the river: the buildings are chiefly of stone quarried in the rock on which the town stands. Saltash appears to have been of more consequence formerly than at present: it is now chiefly inhabited by fishermen. Some trade is carried on in malt. The number of houses in 1831 was 245; of inhabitants 1637. The rest of the parish, which is tolerably large, contained at the same time 280 houses and 1455 inhabitants. The market is on Saturday. Besides the chapel of ease, there are two dissenting meeting-houses, if not more, and a free school.

Saltash was made a free borough in the reign of John or Henry III. The borough sent members to parliament from the time of Edward VI.: it was disfranchised by the Reform Act. The town of Saltash, as one of the passes into Cornwall, was the object of many contests in the great civil war. It was first fortified by the parliament, but surrendered without resistance to the Royalists under Sir Ralph Hopton in 1642: in 1643 the Parliamentarians, finding it open, hastily fortified it; but the Royalists soon after took it by assault. It was subsequently twice occupied by the Parliamentarians, and as often recovered by the Royalists; but was finally abandoned by the king's troops in 1646. Saltash was antiently called Esse or Asheburgh or Ashe. Trematon Castle, in the parish of St. Stephens, will be noticed hereafter.

The perpetual curacy of Saltash is worth 45*l.* per annum, with a parsonage house; the living of St. Stephens is a vicarage, of the net value of 139*l.* per annum, is in the diocese of Exeter and archdeaconry of Cornwall.

Stratton, in Stratton hundred, is in the northern extremity of the county, on a rivulet the waters of which ultimately fall into the sea at Bude Haven, in Bude Bay. It is 222½ miles from London by Exeter, Crediton, Hatherleigh, and Holsworthy. The harbour at Bude admits only small vessels. Sea sand is sent from Bude far inland for manure. The number of houses in the parish in 1831 was 305: the number of inhabitants was 1613.

Stratton, or the immediate vicinity, has been generally allowed to be the site of a Roman station, Musidunum; but its chief historical interest is derived from the battle fought near it in the civil war of Charles I. The scene of action was really in the neighbouring parish of Ponghill: the earl of Stamford, with the parliamentary army, was attacked May 6, 1643, by the Cornish royalists, who were far inferior in number, under Sir Ralph Hopton, Sir Beville Grenville, and others. The Royalists gained a complete victory, taking the camp of the enemy, with all their artillery, baggage, and provisions, and many prisoners. Sir Ralph Hopton was created Lord Hopton of Stratton, and after his death, Sir John Berkeley, who had distinguished himself in the battle, was created Lord Berkeley of Stratton.

Tregony is a borough, in the parish of Cuby, in the hundred of Powder, on the left or east bank of the river Fal, 251 miles from London, through Tavistock, Liskeard, and St. Austell. This town was formerly of some consequence, but it began to decay as Truro began to flourish. The houses are chiefly arranged in one long street on the side of a hill sloping down to the Fal, over which there is a bridge. The

number of houses in 1831 was 234: the number of inhabitants was 1127 in the borough, or 1282 in the whole parish. The parish church of Cuby is in the upper part of the town. The market is on Saturday. The corporation of Tregony consists of a mayor, recorder, and seven or eight capital burgesses. The borough is said to have sent members to parliament in the time of Edward I.; but if this, which is doubtful, be admitted, it appears that the franchise was disused till the reign of Queen Elizabeth. From that time two were returned until the borough was disfranchised by the Reform Act. Tregony is considered to have been a Roman station, Cenium or Voluba. There was a castle of the Pomeroyes at Tregony, of which there are now no remains.

The living of Cuby is a vicarage, united with the vicarage of Tregony, the church of which, dedicated to St. James, was in old Tregony, and was partly standing in the last century: their joint value is 311*l.*; in the gift of J. A. Gordon, Esq.; in the diocese of Exeter and archdeaconry of Cornwall.

Bossiney [BOSSINEY], St. German's, West Looe, and St. Michael's, are decayed boroughs. For the borough of Newport, we refer to LAUNCESTON.

St. German's is in the hundred of East, on the river Tidi, which unites with the Lynher, forming the St. German's river; 228 miles from London through Plymouth and Saltash. It is on the slope of a tolerably high hill, which rises on the north side of it. The houses (which, in 1831, amounted to 491 for the whole parish, one of the largest in the county), are arranged mostly in one street. The inhabitants of the parish (2586 in 1831) derive their chief support from agriculture and fishing. St. German's was at a remote period the seat of a bishopric, which was afterwards united with that of Crediton, and from this union arose the see of Exeter. Athelstan, king of England, had established here a college of priests, who were afterwards made canons of the order of St. Augustine; and the manor of St. German's was divided between the priory thus formed and the bishop of Exeter. At the Suppression, the revenues of the priory were valued at 243*l.* 8*s.*, Dugdale and Speed; or 227*l.* 4*s.* 8*d.* according to the Clare MS. Valor. The conventual church, now used as the parish church, was formerly much more extensive. The antient chancel fell to the ground in 1592, in consequence of the necessary repairs having been neglected: the church now consists of a nave and two aisles. The west front has two towers, both of which are supposed to have been once octagonal in the upper part, and quadrangular below: the north tower retains that form, but the south tower has been altered, and is quadrangular throughout. Between the towers is the entrance, formed by a very deep Norman arch with shafts and mouldings, and two small Norman windows above. The architecture of the south aisle is very dissimilar, and the use of the pointed arch indicates its later erection; indeed the pointed arch is found even in the west front, which has probably undergone partial alteration. In the part now employed as the chancel is a rude antient seat, generally called 'the bishop's chair,' but probably nothing more than the seat of one of the monks. There is a fine altar-piece, a pulpit curiously veneered and inlaid, and several monuments. The seat of the earl of St. German's, called Port Eliot, is in the immediate vicinity of the church, and occupies the site of the antient priory: the outside is irregular and devoid of magnificence, but many of the apartments are convenient and spacious, and decorated with paintings. The site of the abbey and other lands were, at the Dissolution, leased to John Champernowne and others, and afterwards granted in fee, in consideration of a sum of money, to Catherine, widow of John, and two other persons. Champernowne is said to have obtained his share in the monastic plunder by a trick creditable to his ingenuity rather than his fairness. Two gentlemen making suit to the king for these lands, Champernowne, then in attendance at court, kneeled behind them when they kneeled to his majesty, as though he had been a party to the petition, joined with them in returning thanks, and afterwards claimed his share, which, on an appeal to the king, was allowed him. From the Champernownes the estate passed to the Eliot family, of which the present earl of St. German's is the representative. There are two cattle fairs in the year. There is a free school, founded and endowed by Nicholas Honey, and we believe farther supported by the Eliot family. St. German's returned members to parliament in 1562, when its right to send was questioned. The right of election

was nominally in all householders within the borough (which however contains only a few houses), but was virtually vested in the freemen, who amounted, according to Oldfield's *Representative History*, Lond., 1816, to seven: the borough was disfranchised by the Reform Act. The living is said, in the *Clerical Guide* (1836), to be a perpetual curacy, of the annual value of 101*l.* with a glebe house, in the gift of the dean and chapter of Windsor; in the diocese of Exeter and the archdeaconry of Totnes; but according to Messrs. Lysons (*Magna Britannia*), it is in the peculiar jurisdiction of the bishop of Exeter.

West Looe is separated from East Looe by the river Looe. It contained, in 1831, 126 houses, and 503 inhabitants. It is in the parish of Talland, which includes also a part of the market-town of Polperro. There is a narrow bridge over the Looe, uniting the two boroughs of East Looe and West Looe. There was formerly a chapel at West Looe dedicated to St. Nicholas, but it is now converted into a guildhall. The market, which was on Wednesday, has been long discontinued. This place was incorporated by Queen Elizabeth: the corporation consists of twelve burgesses, including the mayor. This borough sent members to parliament from the time of Edward VI.: the election was in the corporation. West Looe was disfranchised by the Reform Act.

St. Michael's, otherwise Michell, is on the main road from Bodmin to Penzance and the Land's End, 248 miles from London: it is partly in the parish of St. Enoder, and partly in that of Newlyn, both in the hundred of Pyder. This place deserves notice only as being one of the boroughs disfranchised by the Reform Act. It returned two members from the time of Edward VI. The right of election was declared in 1700 to be in the lords of the manor capable of being portreeves (the portreeve is the returning officer), and in the inhabitants paying scot and lot. The latter, in the time of Browne Willis, were in number twenty-six; but Sir Christopher Hawkins having purchased the borough, pulled down the cottages as fast as they became empty, and so reduced the number of voters to four, exclusive of the lords of the manor. The population of St. Enoder was, in 1831, 1124; that of Newlyn, 1218.

The living of St. Enoder is a vicarage, in the gift of the bishop of Exeter, of the annual value of 278*l.*, with a glebe-house: that of Newlyn is a vicarage, also in the gift of the bishop, of the annual value of 380*l.*, with a glebe-house. Both are in the diocese of Exeter and the archdeaconry of Cornwall. Both churches are distant, St. Enoder three miles north-east, Newlyn two miles north-west, from St. Michell.

Divisions for ecclesiastical and legal purposes.—Cornwall was antiently a diocese by itself; and opposite opinions have been entertained as to the place where the see was first established: according to Camden, Tanner, and Gough (the editor of Camden), the see was fixed at Bodmin first, and afterwards removed to St. German's; while Mr. Whitaker, who is followed by Messrs. Lysons, contends that it was originally fixed at St. German's, and continued there until it was united with the see of Crediton. Out of this union rose the see of Exeter, in the diocese of which Cornwall is now included. The limits of the county nearly coincide with those of the archdeaconry of Cornwall; but thirty-two parishes, according to Messrs. Lysons, are exempt from the archdeacon's jurisdiction. The archdeacon's visitations are held about a month after Easter in each year at Launceston, Liskeard, Bodmin, Truro, Helston, and Penzance. The archdeaconry is subdivided into eight rural deaneries—East, Kerrier, Penwith, Powder, Pyder, Trigg Major, Trigg Minor, and West. The office of rural dean is in this county an efficient office. The deans are appointed yearly, and make regular visitations to all the churches within their deaneries, reporting the state of the churches at the archdeacon's visitation.

Messrs. Lysons give the number of parishes as 203 (two less than those given in the Population Returns), of which 85 are rectories, 100 vicarages, and 18 donatives or curacies.

Cornwall is in the western circuit. The Spring assizes are held at Launceston, the summer assizes at Bodmin. The Epiphany and Midsummer quarter-sessions are held at Lostwithiel, the Easter sessions at Truro, and the Michaelmas sessions at Bodmin. There are a county gaol and house of correction at Bodmin, and another older county gaol at Launceston, which is used at the assizes. The Cornish sessions are not attended by barristers. (Lysons' *Magna Britannia*.)

This county is however under a peculiar jurisdiction, which requires notice here,—that of the duke of Cornwall. The duchy of Cornwall was created in 1337 in favour of Edward the Black Prince, and settled by act of parliament on the eldest son of the king of England. The Duke enjoyed large revenues, arising from the lordship of castles, boroughs, and manors, granted to him in Cornwall and Devonshire; the profits arising from the coinage of tin, and various other sources. The annual revenue on the average of the three years subsequent to the death of the Black Prince was 2493*l.* 7*s.* 3½*d.*; the clear revenue in the 15th year of Henry VIII. amounted to 10,095*l.* 11*s.* 9½*d.*; in the 44th year of Queen Elizabeth, in 1602, it had fallen to 4569*l.* 12*s.* 2½*d.*; and at the publication of Messrs. Lysons' *Magna Britannia* (1814), the gross amount was estimated at 22,000*l.*, of which 8500*l.* arose from the tin-duty in the county of Cornwall, and 3500*l.* from the rents of manors, fines, &c. in the same county: the sources from which the remainder was derived are not mentioned. The tin-duty before the war of 1793 had been 14,000*l.* per annum. The immediate government of the county was vested in the Duke, who has still his Chancellor, Attorney-general, and Solicitor-general, and his court of exchequer. He also appoints the sheriffs. The mining trade is under the separate jurisdiction of the Stannary Courts; the Lord Warden of the Stannaries, and the Vice-warden, are at the head of this jurisdiction, with a final appeal to the duke and his council. The miners claim to be free from all jurisdiction but that of the Stannary Courts, except in cases affecting land, life, or limb. The Vice-Warden's Court is held once a month, and is a court of equity for all matters relating to the tin mines and trade; no writ of error lies to the courts at Westminster, but there is an appeal to the Warden, and from him to the Duke in council, or, when the duchy is vacant, to the King in council. Issues are frequently directed by the Vice-warden to be tried in the Stannary Courts, which are held at the end of every three weeks before the Steward of each of the four 'Stannaries' or mining districts: in these courts all civil actions, in which either plaintiff or defendant is a privileged tinner, are tried before the Steward and a jury: from these courts an appeal lies to the Vice-warden, and from him as in other cases. The four Stannary districts are Foy More, Blackmore, Tywarnhaile, and Penwith and Kerrier. The Stannary laws are revised, or new ones enacted, by the Duke and his council, with the consent of what is called the Stannary Parliament, consisting of twenty-four Stannators, gentlemen of property in the mining districts, chosen six for each stannary. Those for Foy More are chosen by the mayor and corporation of Lostwithiel, those for Tywarnhaile by the mayor and corporation of Truro; and those for Penwith and Kerrier by the mayor and corporation of Helston. The last Stannary Parliament was held at Truro in 1752, and continued by adjournments to September, 1753. The Stannary laws have been repeatedly published. The Stannary prison was at Lostwithiel, but by the recent Act (which we shall presently mention) it is now at Bodmin. The antient records of the Stannaries were kept at Lostwithiel till they were burnt in the great civil war of Charles I., in 1644, by the parliamentary army.

An act was passed in the 6th and 7th Wm. IV., cap. 106, entitled 'An Act for the better and more expeditious Administration of Justice in the Stannaries of Cornwall, and for enlarging the Jurisdiction and improving the Practice and Proceedings in the Courts of the Stannaries.' By section 4 of this act, the equitable jurisdiction of the Vice-Warden is extended to all matters connected with the working of lead, copper, or other metal or metallic minerals within the county of Cornwall. By section 6, the Stannary Courts are consolidated, and are to be held before the Vice-Warden, who is to have the same authority that the stewards had. By section 14, the Vice-Warden is authorized to make rules and orders for the regulation of the practice and proceedings of his court; such rules as relate to the Equity side of his jurisdiction to be confirmed by the Lord Chancellor, and such as relate to the Common Law side by one of the judges of the superior courts of Common Law at Westminster. The Vice-Warden's Court (section 21) is made a Court of Record, and is held at Truro. For other details, see the Act.

Previous to the Reform Act Cornwall had the largest share in the parliamentary representation of all the English counties: up to 1821 it had sent forty-four members, viz.

two for the county, and two each for twenty-one boroughs, none of them of any great importance, and some of them utterly insignificant. The county was represented in parliament at the time of the first summons of Edward I., and in the latter part of that monarch's reign it returned two knights of the shire, and representatives for the six boroughs of Launceston, Bodmin, Lostwithiel, Helston, Truro, and Liskeard: to these were added, in the reign of Edward VI., Saltash, Camelford, West Looe, Grampound, Bossiney, St. Michael's, and Newport; in the reign of Mary, Penryn and St. Ives; and in that of Elizabeth, Tregony (though it has been asserted that this borough sent members in the time of Edward I.), St. German's, St. Mawes, East Looe, Fowey, and Callington. In 1821 Grampound was disfranchised. By the Reform Act the county was formed into two divisions, each returning two members: St. Michael's, Bossiney, St. Mawes, East and West Looe, St. German's, Newport, Camelford, Tregony, Saltash, Callington, Fowey, and Lostwithiel were disfranchised; and the members for Liskeard, Launceston, St. Ives, and Helston reduced to one each; making the number of members sent by the county only fourteen. The chief place of election for the eastern division of the county is at Bodmin, and the polling stations are Bodmin, Launceston, Liskeard, Stratton, and St. Austell. The chief place of election for the western division is Truro, and the polling stations are Truro, Penzance, Helston, and Redruth. The town of Falmouth was, by the Boundary Act, included in the borough of Penryn: the boundaries of other boroughs were enlarged, but no other addition was made that requires notice here.

Natural Curiosities.—The granite rocks of Cornwall present in different places an appearance so singular, that they have been mistaken for the efforts of human art in its earliest and rudest stage. The Cheese Wring or Wring Cheese occupies the highest ridge of a hill north of Liskeard, one of the hills which gradually decline from Brown Willy and Rough Tor, the highest parts of the county. The summits of all these hills are covered with granite cairns in different states of ruin, and their sides are strewn with bowlders which have fallen from them. Cheese Wring is a cairn or heap consisting of five stones piled one on the other, of which the upper ones are so much the largest as to overhang on all sides the lower ones, which form their base. The collective height of the whole pile is about fifteen feet, according to Dr. McCulloch, whose account (*Geological Transactions*, vol. ii. pp. 66-78) we follow; but Dr. Borlase states it at thirty-two feet. The formation of this group is ascribed by Dr. McCulloch solely to natural causes. It is, in fact, the remain of a much larger mass, the lateral parts of which have fallen away, not being so well poised as the singular part which yet remains. The granite of Cornwall is in general split by fissures, which tend for the most part to the horizontal or perpendicular; and by these fissures it is divided into cubical or prismatic masses. Where the rock rises above the surface, the influence of the atmosphere causes a gradual decay, by which first the angles formed by the fissures with the external face of the rock become rounded, then the surfaces in contact become separated, the masses originally angular acquire a curvilinear outline; and if the centre of gravity of the whole mass be high and far removed from the perpendicular of the fulcrum, the upper parts of the mass fall down, and by the continuance of the disintegration acquire the spheroidal form which the granite bowlders often exhibit. If, however, the centre of gravity be in the perpendicular of the fulcrum, the mass retains its position, as in the case of Cheese Wring, or produces the phenomenon that will be next described.

The Logging (or, as it is sometimes written, Logan) Stones are stones which are poised on a fulcrum, and which rock, when moved by an adequate force. The most remarkable of these Logging Stones is near the Land's End, on a peninsula of granite jutting out 200 yards into the sea, the isthmus still exhibiting some remains of the antient fortification of Castle Treryn. The granite which forms this peninsula is split by perpendicular and horizontal fissures into a heap of cubical or prismatic masses. The whole mass varies in height from 50 to 80 or 100 feet; it presents on almost every side a perpendicular face to the sea, and is divided into four summits, on one of which, near the centre of the promontory, the stone in question lies. The general figure of the stone is irregular; its lower surface is not quite flat, but swells out into a slight protuberance, on

which the rock is poised. It rests on a surface so inclined, that it seems as if a small alteration in its position would cause it to slide along the plane into the sea; for it is within two or three feet of the edge of the precipice. The stone is 17 feet in length, and above 32 in circumference near the middle, and is estimated to weigh nearly 66 tons. The vibration is only in one direction, and that nearly at right angles to the length. A force of a very few pounds is sufficient to bring it into a state of vibration; even the wind blowing on its western surface, which is exposed, produces this effect in a sensible degree. The vibration continues a few seconds. There is another Logging Stone at St. Just, and a third at Sithney, which has been thrown down; but this near the Land's End is the largest.

On the horizontal surface of the granite the action of water has formed excavations with rounded bottoms, occasionally circular in their outline, and as regularly spheroidal as if shaped with a turning-lathe. They are of various depths, and sometimes communicate with each other. The surface of 'the rock basin quoit' at Carn-brea is honey-combed by these hollows. In the parish of Constantine are two very singular monuments. One is a huge stone resembling an inverted cup or mortar, but not hollow, so regularly formed as to present the appearance of art. It is 30 feet in girth and 11 high, according to Dr. Borlase. The other monument is a vast stone perched on the points of two rocks, so that a man may creep under it; it is 33 feet long from north to south, which is its greatest dimension; the breadth from east to west is 18½ feet, and the thickness or vertical dimension is 14½ feet; the circumference is computed to be 97 feet, and the girth about 60 feet; it is estimated to weigh at least 750 tons. The top is honey-combed by rock basins similar to the rock basin quoit at Carn-brea. There are in Cornwall and the Scilly Isles other stones similarly supported; they are commonly designated by the name 'Tol-men,' i. e., hole of stone. (Borlase, *Antiquities of Cornwall*.)

The cairns on Carn-brea Hill, near Redruth, and the Roche Rocks, a little to the left of the road from Bodmin to Truro, are of granite, and owe their picturesque form to natural causes.

History and Antiquities.—Before and at the time of the Roman invasion, Cornwall was probably included in the territory of the two tribes, the Damnonii and the Carnabii. Ptolemy mentions only the former of these, whom he terms Δουμνόνιοι, Dumnonii; and they seem to have occupied the south-eastern part, comprehending all the Channel coast. The Carnabii are not, we believe, noticed by any writer except Richard of Cirencester, who considers that they gave to the county the name which it had in the Latin of the Middle Ages, Cornubia. It is, however, more probable that the district gave name to the people, and that both Carnabii and Cornubia contain the Celtic root kern or corn, signifying a horn. The second part of the modern designation of Cornwall is derived from the Saxon Wealas, a name given to the Britons, some of whom, on the Saxon invasion, retired into the western part of the island, and maintained a long struggle for their national independence. Mr. Whitaker considers that the Cimbri, a people mentioned also by Richard, extended into Cornwall; but this supposition does not appear to be well supported.

At an early period this part of the island was frequented by the Phœnicians of Gadeira (Cadiz), who came hither to procure tin, lead, and skins, but especially the first; in return for which they gave salt, earthenware, and copper goods. (Strabo, lib. iii. 175.) It was probably from these Phœnicians that the western extremity of Britain, with the Scilly Islands, obtained the name of the Cassiterides (κασσιτερίδες), 'tin-islands,' from a root which, in some of the oriental tongues, as well as in Greek, denotes tin. The Greeks appear to have had some knowledge of those parts of the island where tin was wrought, before the time of the Roman conquest. (Borlase, *Antiquities of Cornwall*.)

To this remote period we may probably refer some of the rude stone monuments which are still numerous in this part of the island. Rough blocks or obelisks standing in pairs, and supposed to be memorials of the dead, are found at Dryft, in the parish of Sancreet, between Penzance and the Land's End, and at Trewren, in Maddern parish, near Penzance. There are two stones at Bolleit in St. Buryan or Burian (also near the Land's End) which are a furlong apart, one twelve, the other fifteen feet high. On the

downs between Wadebridge (near Padstow) and St. Columo are nine rude stone blocks or pillars placed in line, bearing north-east and south-west, and called the Nine Maids. The circles of stones are numerous in this county, and are generally known by the name of Dawns Men, i. e., the stone dance. Boskednan circle, in the parish of Gulvall and Boscawen-ûn in St. Buryan, are formed of stones placed at some distance from each other, and, for the most part, according to the plates given by Dr. Borlase, yet erect. Boscawen-ûn has a stone in the centre fixed in the ground, and leaning so far, that unless fixed at the base, it would surely fall. Other circles are formed by stones not erect, but placed near each other, so as to form a kind of fence; such are Zenor Circle, between St. Ives and Cape Cornwall, and Kerris Roundago, near Penzance, an oval inclosure, with four stone pillars at one end, marking out a quadrangular space. All these are in the western part of the county. Near Liskeard are three circles, very near each other, formed by erect stones placed at some distance; several of the stones have been carried away, and others overthrown. Popular superstition has attached to this monument a legend that the blocks were once men transformed into stones as a punishment for engaging in the sport of hurling on the Lord's Day: hence the name given to this monument of 'The Hurlers.' A similar legend is attached to a monument in the parish of St. Buryan, where nineteen maidens are said to have been turned into stone for dancing on the Lord's Day. At Botallack, in St. Just parish, near Cape Cornwall, are several stone circles intersecting each other; and on the hill Carn-Menez in the parish of Wendron, between Redruth and Helston, is a stone circle, having in the middle of it a natural rock of four masses piled on each other after the manner of the Cheese Wring. Other stone circles are found at Tredinek in Gulvall parish, near Penzance; at Crellas, in Sancreet parish, between Penzance and the Land's End; and in two of the Scilly Islands, St. Mary and Tresco. There are also in Cornwall several circles, which Dr. Borlase supposes to have been devoted to the purposes of an amphitheatre. They are called 'plân an guare,' 'the plain of sport or pastime.' The amphitheatre of St. Just, near Cape Cornwall, may be taken as a specimen of these circles; it consists of circular stone seats rising regularly one above another, and enclosing an area of 126 feet diameter. The seats or steps, six in number, are of stone, 14 inches wide and 1 foot deep, surmounted by a rampart 7 feet wide, and rising 1 foot above the highest seat, with a ditch outside 10 feet deep from the top of the rampart. In the other amphitheatres the seats are usually of turf, as at Piran Round, or Perran Round, between St. Columb Major and St. Agnes. If we may infer anything from the more regular construction of these circles, we should assign to them a much later date than the period of which we are now speaking.

Various other antiquities may be noticed here as having probably had a British origin, though of uncertain date. There are several barrows, or sepulchral mounds, composed some of loose stones, others of earth, and others of stones and earth mingled. Some of these, on being opened, have been found to contain sepulchral urns; others, in the Scilly Isles, have an outer ring or edge of large stones, and within a cavity formed by stone walls, with flat stones at the top, and the cavity covered with the mound of loose stones or earth. There are also several cromlechs, the top stones of which are in Cornwall called 'quoits.' The quoit of Lanyon Cromlech is 19 feet long and 47 feet in circumference; its thickness varies, being in some parts as much as 2 feet; it is raised so high that a man can sit on horseback under it. It has four upright stones, but one is too short to give it any support.

Among the smaller relics of antiquity may be mentioned the sepulchral urns dug up from some of the barrows; some hollow instruments of brass or other mixed metal, apparently the heads of weapons called celts, a similar instrument of stone; spear-heads and broken pieces of copper swords; lumps of fine copper, evidently designed for melting; and a considerable number of gold coins found in 1749 near Karn-bré or Carn-brea Hill, in the neighbourhood of Redruth: these coins, which are described as rude imitations of Greek coins, are considered by Dr. Borlase to be British. Messrs. Lysons would refer the neatly-executed sepulchral urns to the Roman period, as well as the barrows that contain them; possibly, however, they may be more antient, as well as the brass or copper weapons and instruments;

for instruments of copper and pieces of earthenware are recorded by Strabo among the Phœnician importations.

There are also in Cornwall several artificial caves or subterranean galleries, formed by walls of upright stones, with other stones laid across; some of the galleries extend 30, or even 60 feet in length. The upright stones, or obelisks, with inscriptions in the Roman character, and in the Latin tongue, must be referred to a period subsequent to the Roman invasion; and from their inscriptions or symbols, several must have been posterior to the introduction of the Christian religion. Other miscellaneous antiquities of British origin we must pass over.

The period at which Cornwall fell under the power of the Romans is not known. Dr. Borlase ascribes the conquest to Agricola; Dr. Stillingfleet to Vespasian. As however none of the Roman historians who have recorded the affairs of Britain noticed the conquest of Cornwall, or of the tribes inhabiting it, it is probable that it was not signalized by any great exploits. Some of the older antiquaries denied that Cornwall ever came under the Roman dominion; but, apart from the improbability of the rich mines of this county escaping the notice, or being defended from the power of that people, the quantity of Roman coins and other Roman remains found in Cornwall, shows that Cornwall shared in the general subjection of South Britain.

The geography of Cornwall during the Roman period is very obscure. Ptolemy notices the headlands of Antivestæum, or Bolerium (*Αντιουίσταιον*, or *Βολέριον*), supposed to be the Land's End; and Ocrinum, or Damnonium (*Ὀκρινον*, or *Δαμνόνιον*), supposed to be the Lizard; and Richard of Cirencester adds the *Κριόν μέτωπον*, or Rame Head. Ptolemy mentions the æstuaries of the river Tamarus (*Τάμαρος*) which the name enables us to identify with the Tamer, and the Cenion (*Κενίων*), probably the Fal, which has the most remarkable æstuary west of the Tamar. Of the towns of the Damnonii, mentioned by Ptolemy, Voluba, or Voliba (*Ὀβολίβα*), has been fixed at Tregony, or Grampound, or perhaps at Wolverdon, where is a camp, probably Roman, on the Fal, (the name of which has been supposed to be incorporated in the word Vol-uba), and at Lostwithiel, or elsewhere on the Fowey. Uxela (*Οὔξελα*), which some have fixed at Lostwithiel, is more generally regarded now as having been in Somersetshire. Tamare (*Ταμαρή*) fixed by Horsley at Saltash, is by others removed into Devonshire, to Tamerton. To these towns, all mentioned by Ptolemy, we may add on the authority of Richard, Cenia, whose name seems to connect it with the Fal, the *Κενίων* of Ptolemy, but which is nevertheless fixed by some at Condurra, on the river Hel, or Helford, where are the remains of a Roman camp; Musidum, or Musidunum, which is fixed near Stratton; and Halangium, supposed to be Karnbré. Two if not three Roman roads enter Cornwall from Devonshire. One was the continuation of the great road which ran westward from Isca Dumniorum, or Exeter, and it is said may be traced on the downs west of Liskeard; it is conjectured to have proceeded westward by Lostwithiel, St. Austell, and Grampound (or Tregony), to Bossens (where is a Roman camp), near the river Heyl, which falls into St. Ives' Bay, and from thence to Marazion, or rather to St. Michael's Mount, the presumed Ictis (*Ἰκτις*) of Diodorus. The other road came from the north of Devon to Stratton, and is conjectured to have led towards Bude Haven, which was probably then a large and more important harbour. The existence of a third Roman road is doubtful. A road, probably British, the direction of which is marked by the occurrence of barrows, runs from the Land's End, near Redruth, Michel or St. Michael's, and St. Columb, towards Stratton. Besides the places above mentioned, Launceston has been supposed to be a Roman station. Cornwall was included in Britannia Prima.

Upon the departure of the Romans, Cornwall recovered its independence, which it maintained for a long time against the invading Saxons. The famous Arthur, whose history has been so distorted by fable as to cast a doubt over his existence, is generally reputed to have been a native of this county.

The continued and resistless pressure of the Saxons having driven westward those Britons who refused to bear the yoke of the invaders, Cornwall and Devonshire became the place of refuge to many. It was probably about this time that part of the superabundant population thus compressed into the extremity of the island, took refuge in Bretagne, already colonized by their countrymen [BRETAGNE], and gave

to a district there the name of the country which they had left. [CORNOUAILLES.] The Cornish Britons and those of Wales appeared to have recognised one supreme authority until about the middle of the seventh century, when Cadwaladr, the last British sovereign, abdicated his throne, and went to Rome, where he died. Upon his death, A. D. 680, Ivor, son of Alain, king of Bretagne, was sent by his father with a powerful fleet to obtain the crown, and met at first with considerable success, defeating the West Saxons, and obtaining possession of Cornwall, Devonshire, and Somersetshire: he was however afterwards driven from the island by the West Saxon king Kentwin. In A. D. 710, Ina, king of Wessex, defeated the Cornish Britons, under their king Geraint. Æthelheard, successor of Ina, renewing hostilities, was defeated by Rodri Maelwynawc at Heilyn. In A. D. 743, Cuthred, king of Wessex, defeated the Britons, but from his having the assistance of the Mercians, we consider it likely that it was the Britons of Wales, not Cornwall (as Messrs. Lysons suppose), who were attacked by him. The Cornish Britons had however to sustain the hostility of Cynewulf, one of his successors.

In A. D. 800, Egbert ascended the throne of Wessex, and his first hostilities were directed against Devonshire and Cornwall: the Britons were defeated in 813, and he ravaged the country unchecked. In 823 a great but indecisive battle was fought at Gafulford (supposed to be Camelford), between the Cornish Britons and the Saxons, who had by this time acquired the partial if not the total possession of Devonshire. Twelve years afterwards, in 835, the Cornish men, assisted by the Danes, who were beginning to assail England, were defeated on Hengston-hill (Hingston Down), near Callington, by Egbert, who had now established the permanent supremacy of Wessex, and deprived the Britons of the relief which they had hitherto experienced from the dissensions of the Anglo-Saxon princes. Irritated by the aid which they had given the Danes, Egbert prohibited the Britons from setting foot within the Saxon territories on pain of death. During the reign of the successors of Egbert, we hear little of Cornwall until we come to the time of Athelstan, by whom the whole country, including the Scilly Isles, was reduced and incorporated with the now consolidated kingdom of England. From this time the provincial history of Cornwall offers little to interest the reader for many centuries. Some ravages of the Danes, and some intestine commotions, are the only memorable events. The attempt of Henry de la Pomeroy to seize St. Michael's Mount, in order to support the rebellion of Prince John against his brother, Richard I., has been already noticed.

Of the obscure and troubled period over which our historical notice extends, Cornwall retains many memorials in the camps and earth-works, which are more numerous in this country than in any other. These are, for the most part, nearly round or oval, a form which induces us to refer them to any other than a Roman origin. They possibly were formed during the severe and protracted struggles of the Cornish Britons with the Anglo-Saxons. In many places of the coast, a small promontory, or portion of the cliff, is enclosed by a rampart, or vallum, running from one edge of the cliff to the other, and strengthened on the land side by a ditch. These, if situation be any clue to their origin, may be ascribed to the Danes. The space enclosed is considerable; in one case (in the parish of St. Gorran, near Mevagissey,) it amounts to 100 acres. Our space forbids a description of these works, and a mere catalogue would be useless.

The ruins of castles and of monastic establishments belong to a later period than the earth-works; but in these Cornwall is not remarkably rich. On the hills are the remains of rude circular buildings, called castles, the walls of which were formed of dry stones, not joined with any cement: these must be referred to an early period; Dr. Borlase considers them to be of Danish origin. In the narrow part of the county west of Mount's Bay and St. Ives' Bay, there are no less than seven of these castles, of which the most remarkable are Caer Bran in Sancreet parish, Castle an Dinas in Ludgvan parish, and Chûn Castle in Morvah. Chûn Castle consists of an oval enclosure surrounded by a wall, which Borlase estimates to have been originally 15 feet high, or rather more; 8 feet thick at the present top, but thicker at the foundation: outside of this is a ditch 30 feet wide; and outside of this, an outer wall, probably 10 feet high, and about 5

feet thick. The entrance, made intricate for the purpose of defence, is enclosed by walls running from the outer wall, on one side of the entrance quite to the inner wall, and on the other to within three feet of it: two other walls running from the outer to the inner wall serve, with the entrance, to divide the ditch into three parts. Round the outer wall is a ditch, the width of which is not given. The space enclosed by the inner wall is 125 feet from east to west, and 110 from north to south; it is divided into several compartments ranged round the inside of the wall: there is a well in the enclosure.

Of castles intended for residence as well as defence, may be mentioned Karn-brê, or Carn-brea Castle, on Carn-brea hill, near the Land's End. This is very small, scarcely 60 feet long by 10 wide, built upon a ledge of rock, whose uneven surface has caused great diversity in the level of the rooms upon the ground floor. The building had three stories in some parts, in others but one. Part of the building is very antient and of rude architecture, and the less antient part is thought to have been built on older foundations. Carn-brea hill abounds with antiquities: there is an antient camp of irregular form, some cairns, and other antiquities of rough stone. Tintagell Castle has been already noticed. [BOSSINEY.] For Launceston Castle, see LAUNCESTON.

Trematon Castle is on an eminence over the river Lynher, in the parish of St. Stephens, and not far from Saltash. It has a base court surrounded by an embattled wall of irregular form, following the shape of the hill on which it stands, and pierced with loop-holes. The keep is on an artificial mound, at the north-east corner of the base-court, about 30 feet high: the walls of the keep are 30 feet high, and 10 thick: it is nearly oval, and its inner dimensions are 66 feet by 52. It has no windows in the outer wall. In the time of William Rufus this castle was held by the Valletort family. In the Cornish rebellion in 1549 (reign of Edward VI.), Trematon Castle was defended for a while against the rebels by Sir Richard Grenville.

Of Restormel Castle, in the parish of Lanlivery, near Lostwithiel, the only part now remaining is the keep, a building of large dimensions: it is on a steep mound, formed out of a rocky hill, and has a deep ditch. The enclosure of the keep is an exact circle of 110 feet diameter within; it has walls 10 feet thick at the top: from the present floor of the ground-rooms to the top of the parapet, is 34½ feet. Restormel Castle was a seat of the family of the Cardinans; it afterwards came into the possession of the earls of Cornwall: it is still attached to the duchy.

The castles of Fowey and St. Mawes have been noticed above. For Pendennis Castle, see FALMOUTH.

There are few remains of monastic buildings in Cornwall. The church of St. German's priory has been already described: the monastic remains on St. Michael's Mount have been also noticed. Of the monastery of St. Benet, near Lanivet, there are considerable remains, now occupied as a dwelling-house. The tower of the church is also standing. There is no certain account of this religious house, which is said to have been a Benedictine nunnery, subordinate to some foreign monastery. The chapel of St. Lawrence's Hospital, near Bodmin, remains. Morwinstow Church, in the northern extremity of the county, and Kilhampton or Kilkhampton Church, near Straton, are very antient, being wholly or chiefly of Norman architecture. Sheviok Church, near St. German's, has some portions of early English, and other portions of decorated English architecture.

In the war of the Roses, the Cornish men seem to have taken the Lancastrian side, induced mainly by the influence of Sir Hugh Courtenay of Boconnoc, and Sir John Arundell of Lanherne: they were present in the field at Tewkesbury; and it was in their country (at St. Michael's Mount) that the Earl of Oxford, one of the Lancastrian leaders, sought to make a stand after that fatal day. In the reign of Henry VII. (1495), they rose in rebellion on occasion of a tax levied to defray the expense of a war with Scotland. Thomas Flammock or Flamank, a man of respectable family, and a lawyer; Michael Joseph, a smith of Bodmin, and Lord Audley, were the leaders of this revolt: the common men were armed with bows and bills. The insurgents advanced towards the metropolis, but were entirely defeated on Blackheath, and their leaders executed. In 1497 the Cornish men were again in arms to support Perkin Warbeck, but the flight of that pretender caused the failure of the attempt. In the reign of Edward VI.,

in 1549, a new revolt broke out, connected with the religious revolution of that period. The Cornish men took up arms to sustain the antient (Catholic) church, and besieged Exeter; but were forced to raise the siege, and at last, though not without difficulty, were subdued. The change of the religious institutions of the county led to the change of the common language of Cornwall; the people, for the most part of British descent, with comparatively few Saxons settled among them, had retained a language of their own, a dialect of the Celtic. The introduction of the English church service paved the way for its gradual decline. When Carew published his survey of Cornwall in 1602, it was going fast into disuse: 'the English speech,' says he, 'doth still encroach upon it, and hath driven the same into the uttermost skirts of the shire. Most of the inhabitants can speak no word of Cornish, but very few are ignorant of the English, and yet some so affect their own, as to a stranger they will not speak it; for if, meeting them by chance, you inquire the way or any such matter, your answer shall be "*Mee a navidra couza Sawzneck*," "I can speak no Saxon-age." In the reign of Charles I., some aged people near Penryn were quite ignorant of the English language. In the early part of the last century, the Cornish was still spoken by the fishermen and market women, near the extreme southern point of the county. At present this antient tongue is the study of the scholar and antiquary alone. A few MSS. in it are extant; the most remarkable of which are some interludes, partly written in the fifteenth century.

In 1595 Penzance and one or two places near it were burnt by the Spaniards.

In the great civil war of Charles I. and his parliament, the Cornish men seem to have been on the whole in favour of the king. At the beginning of the contest indeed, the Parliamentarians, under the leadership of Sir Alexander Carew of Anthony, and Sir Richard Buller of Morval, secured the eastern part of the county, and garrisoned Launceston and Saltash. Sir Nicholas Slanning, a zealous Royalist, held Pendennis Castle for the king; and the Royalists rising under the command of Sir Ralph Hopton and others, drove the parliament forces from Launceston and Saltash, and obtained entire possession of the county: these events were in 1642. In the winter of that year, the parliamentary forces under Ruthen, governor of Plymouth, attempted to regain it, but were defeated on 19th January, 1643, on Broad Oak or Bradock Down, near Liskeard. Saltash, which Ruthen had hastily fortified, was taken by storm, Ruthen escaping to Plymouth; and on May 15th, the Parliamentarians, under the Earl of Stamford, were entirely defeated at Stratton. The Cornish men afterwards distinguished themselves on the Royalist side at the battle of Lansdowne and the siege of Bristol in the same year: and the king in reward of their loyalty wrote them a letter of thanks, which he ordered to be printed and published, and a copy to be read in every church and chapel in the county. In July, 1644, the Earl of Essex marched into Cornwall at the head of the parliamentary forces, and took possession of Launceston, Saltash, Bodmin, Lostwithiel, and Fowey; but being followed by the royal army, under the king in person, was forced to retreat to Fowey with his infantry, his cavalry having previously got clear off. From Fowey Lord Essex escaped with some other persons to Plymouth; but his infantry, 6000 in number, under Major-General Skippon, were forced to capitulate 2nd September. In October, Saltash, which the Royalists had recovered, was seized by a detachment of the parliamentary garrison at Plymouth, but retaken by storm by Sir Richard Grenville. In the autumn and winter of 1645, Charles II., then Prince of Wales, spent some time in Cornwall: in March, 1646, he embarked at Pendennis Castle for the Scilly Isles, upon the approach of the Parliamentarians under Fairfax, who, after defeating Lord Hopton at Torrington, entered Cornwall, forced the Royalist cavalry to surrender, and acquired possession of the whole county. The Royalist army had been disorganized by the disputes of their leaders. Pendennis Castle, one of the last places in England which held out for the king, surrendered in August, 1646. The Scilly Islands had some time before been seized by the victorious party, and Prince Charles forced to flee, first to Jersey, and afterwards to France. In 1648 an attempt to raise forces to restore the king's cause was defeated by Sir Hardress Waller. In 1650 the Scilly Islands were held for the king by a body of English and Irish forces; but the islands were all taken in 1651 by the fleet under Sir George Ayscough.

The Dutch made two attempts on the Cornish coast in the war between them and the Commonwealth, but were defeated in both. Since this period the local history of Cornwall affords little interest.

STATISTICS.—Population. Cornwall may be considered as an agricultural as well as a mining county. It ranks the twenty-seventh on the list of agricultural counties, and has remained stationary in this respect since 1811. Of 67,737 males twenty years of age and upwards inhabitants of the county (in 1831), 24,464 were engaged in agricultural pursuits (of these 16,243 were labourers), and only 107 in ma-

nufactures, or in making manufacturing machinery. Of this latter number 50 were employed in the Jean iron foundry and rolling-mill at St. Erth, 17 in powder-mills at St. Gluvias and Stithians, 5 in a manufactory of tin at Gulvol, and the remainder in weaving, &c. at various places. The number of labourers of twenty years of age and upwards employed in labour, not agricultural, was 22,706.

The following table contains a summary of the number of inhabitants, in 1831, showing their occupations in each hundred, &c. in the county.

HUNDREDS, &c.	HOUSES.				OCCUPATIONS.			PERSONS.			
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other families not comprised in the two preceding classes.	Males.	Females.	Total of persons.	Males twenty years of age.

The population of Cornwall at each time the census was taken since the commencement of the present century was—

	Males.	Females.	Total.	Inc. per Cent.
1801	89,868	98,401	188,269	..
1811	103,310	113,357	216,667	15
1821	124,817	132,630	257,447	19
1831	146,213	154,725	300,938	17

Showing an increase of 112,719 between the first and last periods; which is an increase of rather more than 59 $\frac{3}{4}$ per cent., or 2 $\frac{3}{4}$ beyond the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates, when the census was taken, were—

In 1801	£ 54,648	which was at the rate of	5s. 9d.
„ 1811	103,736	„ „	9s. 7d.
„ 1821	104,178	„ „	8s. 1d.
„ 1831	102,151	„ „	6s. 9d.

for each inhabitant.

The sum expended for the same purpose in the year ending 25th March, 1836, was 74,856*l.* 3*s.*; assuming that the population has increased at the same rate per-centage as in the ten years preceding that period, the above sum gives an average of 4*s.* 7*d.* for each inhabitant. All these averages are below those for the whole of England and Wales.

The sum raised in Cornwall for poor-rate, county-rate, and other local purposes, ending 25th March, 1833, was levied upon the various descriptions of property, as follows:—

	£.	s.	d.
On land	91,906	5	0
„ dwelling-houses	18,995	0	0
„ mills, factories, &c.	2,582	4	0
„ manorial profits, navigation, &c.	7,951	19	0

Total money levied by assessment . 121,435 8 0

The amount expended was:—

For the relief of the poor	100,318	18	0
In suits of law, removal of paupers, &c.	4,453	4	0
For other purposes	15,163	8	0

Total money expended . £ 119,935 10 0

In the returns made up for the three succeeding years, the descriptions of property assessed for local purposes are not distinguished.

	1834.	1835.	1836.
The total money levied, was	£ 118,322 9 0	111,170 14 0	98,846 10 0
Expended for relief of poor	93,036 11 0	84,534 15 0	74,856 3 0
„ in suits of law, removal, &c.	4,182 6 0	3,450 13 0	3,233 1 0
Payments for or towards county rates		8,452 17 0	7,320 8 0
Expended for all other purposes	19,012 11 0	11,913 15 0	11,644 2 0
Total parochial rates expended	116,231 8 0	108,352 0 0	97,053 14 0

The difference of the sums expended for the relief of the poor in the respective years 1835 and 1836 is therefore 9678*l.* 12*s.*, which is rather less than 11 $\frac{1}{2}$ per cent.; the difference of the total of parochial rates expended is 11,298*l.* 6*s.*, making the whole amount of saving rather more than 10 $\frac{3}{8}$ per cent.

The number of turnpike trusts in Cornwall, as ascertained in 1834, was 13; the number of miles of road under their charge was 318; the annual income arising from the tolls and parish composition was 24,044*l.* 15*s.* 8*d.*; and the annual expenditure, 23,895*l.* 5*s.* 10*d.*

The amount of expenditure of county-rate, in the year 1834, was 8,024*l.* 9*s.* 7*d.*, disbursed as follows:—

	£.	s.	d.
Bridges, building, repairs, &c.	555	7	3 $\frac{1}{2}$
Gaols, houses of correction, &c., and maintaining prisoners, &c.	2,637	0	9 $\frac{1}{2}$
Lunatic asylums	200	19	11
Prosecutions	1,417	14	4
Clerk of the peace	344	17	11
Conveyance of prisoners before trial	548	3	2
„ of transports	97	17	6
Coroner	238	13	0
Debt—Payment of principal and interest	1,176	6	6
Miscellaneous	807	9	2

The number of persons charged with criminal offences in the three septennial periods ending with 1820, 1827, and 1834, were respectively 646, 679, and 1144; making an average of 92 annually in the first period; of 97 in the second, and of 163 in the third.

The number of persons tried at quarter-sessions in respect of which any costs were paid out of the county rates in each of the years 1831, 1832, and 1833, were 161, 174, and 168, respectively:

	1831.	1832.	1833.
Total number of felonies so tried	93	130	118
„ misdemeanors	68	44	50

The total number of commitments to the quarter-sessions in each of the same years was 142, 145, and 146, respectively : of whom

	1831.	1832.	1833.
The number convicted was	94	109	101
„ acquitted	18	19	14
Discharged by proclamation	30	17	31

At the assizes and sessions (in 1835) 206 persons were charged with criminal offences in Cornwall; out of which number 22 were charged with offences against the person, 11 of which were common assaults; 3 persons were committed for housebreaking; 145 for offences against property committed without violence; of the remaining 36 one was committed for killing and maiming cattle, 3 for forging and coining, 9 for assembling armed, &c., to aid smugglers, and 23 for riot, &c. Of the whole committed 144 were convicted and 62 acquitted, or no bills found. Among those punished 1 was executed; 29 sentenced to transportation for various periods; 18 imprisoned for terms between 2 years and 6 months, and 73 for 6 months and under; 2 were whipped, 15 fined, 4 discharged on sureties and 2 pardoned. Of the offenders 175 were males and 31 females. Among the whole number 106 could read and write, 55 could read only, 40 could neither read nor write, and the degree of instruction could not be ascertained of the remaining 5. The proportion of the offenders to the population, in 1835, was 1 in 1461.

The number of persons qualified to vote for the county members of Cornwall were, in

	1834.	1835.
The eastern division	4392	4446
western „	3612	3504
	8004	7950

which is 1 in 32 of the whole population, and 1 in 6 of the male population above 20 years of age. The expenses of the last election to the inhabitants of the county were 385*l.* 4*s.* 8*d.*, and were paid out of the general county rate.

There are eight savings-banks in this county. The number of depositors and amount of deposits on the 20th November were as follows:—

	1832.	1833.	1834.	1835.
Number of depositors	6245	6737	7181	7734
Amount of deposits	£252,776	269,885	85,075	306,676

The various sums placed in the savings-banks in 1834 and 1835 were distributed as under:—

	1834.		1835.	
	Depositors.	Deposits.	Depositors.	Deposits.
Not exceeding £20	2915	£24,923	3019	£25,623

Daily Schools	51	1544	52	2,206	795	21,024	75	4214
Sunday Schools	—	—	349	33,220	6	310	12	771
Total.	51	1544	408	35,678	906	23,341	91	5367

Assuming that the population between 2 and 15 years, increased in the same ratio as the whole of the population between 1821 and 1831, and has continued to increase in the same ratio since, we find that there must have been living in Cornwall in 1834 (the time this education inquiry was made) 100,756 persons between those ages. A very large number of the persons receiving instruction attend both daily and Sunday schools. Only six schools are returned from places where no other school exists, and the few children (207 in number) who are instructed therein, cannot be supposed to attend any other school; at all other places Sunday-school children have opportunity of resorting to other schools also; but in what number or in what proportion duplicate entry of the same children is thus produced cannot be ascertained. Twenty-six schools, containing 1381 children, which are both daily and Sunday-schools, are returned from various places, and duplicate entry is therefore known to have been thus far created; we may therefore conclude that scarcely more than half, or, at most, two-thirds of the children receive instruction.

The schools established by Dissenters, included in the above statement, are:—

	Schools.	Scholars.
Infant Schools	2	29
Daily „	7	220
Sunday „	173	18,738

Schools established since 1818 are:—

Infant and other daily schools	483	18,128
Sunday Schools	244	23,775

Fourteen boarding schools are included in the number of daily schools as given above.

No school in this county appears to be confined to the children of the Established Church, or any other religious denomination; such exclusion is disclaimed in almost every instance, especially in schools established by Dissenters, with whom are here included Wesleyan Methodists and one school for Jewish children. Lending-libraries of books are attached to 35 schools in this county.

CORNWALLIS. Charles, second Earl and first Marquis of Cornwallis, was born December 31, 1738, and educated at Eton, and St. John's, Cambridge. In 1761, during the Seven Years' War, he served abroad under the title of Lord Broome, as aide-de-camp to the marquis of Granby. In 1762 he succeeded to the peerage on the death of his father, in 1766 he was made colonel of the 33rd regiment of foot, and in 1770 governor of the Tower. He was also aide-de-camp to the king, who held him in high favour; and it is recorded to his honour, that though a general supporter of the administration, he exercised an independent judgment, and voted against ministers on several important questions. More especially, he was opposed to the steps which led to the American war; but when his regiment was ordered abroad, in 1776, he declined to profit by the special leave of absence obtained from the king, and sailed with it, leaving a devotedly attached wife, who is said to have lost her life in consequence of her grief and anxiety at the separation.

He served actively and with distinction, with the rank of major-general, under generals Howe and Clinton, in the campaigns of 1776-77-78-79 in New York and the southern states, and in 1780 was left in the command of South Carolina with 1000 men. He gained a victory over General Gates at Camden, August 16, 1780, and a second, less decisive, over General Greene at Guilford, March 15, 1781—both against superior numbers. But the population of the country being unfriendly to the royal cause, these advantages were transient. In the course of the spring of 1781 Cornwallis invaded Virginia, where he obtained no decided

success, but caused an immense amount of damage to private property. On receiving orders from Sir H. Clinton, then at New York, to embark part of his forces for New York, he moved to Portsmouth in Virginia; but here he received fresh instructions, under which he was ordered to Williamsburg, the colonial capital of Virginia, and directed to make Point Comfort his place of arms. But Point Comfort being found ill suited for this purpose, Cornwallis moved to York Town on York River, where he entrenched himself in the strongest way he could. He was there besieged by the French and American forces, assisted by the French fleet under De Grasse, and reduced to surrender himself and his troops prisoners of war, after an obstinate defence, October 19, 1781. More fortunate than Burgoyne, he escaped, owing perhaps to his favour with the king, such undeserved persecution as that general experienced. His capture however was a death-blow to the British cause, and principally led to that change of ministers and measures which resulted in the peace of 1782.

In 1786 lord Cornwallis was appointed governor-general and commander-in-chief of Bengal. His temper being mild and equitable, and his application to business constant and effective, he was honourably distinguished by a sincere desire to promote the welfare of our oppressed Indian subjects, and introduced a variety of internal changes, which were characterized by a great unfitness for the purpose they were intended to serve. His administration is chiefly remarkable for the war undertaken against Tippoo Saib [TIPPOO]. The disasters experienced at first by the English caused the governor to take the field himself, in 1791; and by a change in the quarter of attack, he succeeded in penetrating to the heart of Tippoo's dominions, and captured Bangalore, in March. In the following February siege was laid to Seringapatam, and the capture of that city was averted only by a treaty, which stripped the sultan of one half of his dominions. In August, 1793, lord Cornwallis returned to England, where he was received with distinguished honours, raised to the rank of marquis, and appointed master-general of the ordnance. In 1798 (the æra of the rebellion) he was made lord-lieutenant of Ireland. In the distracted state of that country, a man of generous and conciliatory temper was even more needed than one of military skill. He put down the rebellion: but he also checked the disgraceful outrages practised by the supporters of government, restored tranquillity, and acquired the good-will of the Irish. In 1801 he was succeeded by lord Hardwicke; and in the same year, being appointed plenipotentiary to France, he negotiated the peace of Amiens. He was re-appointed governor-general of India in 1805, and arrived at Calcutta in August, in bad health. Proceeding immediately to assume the command of the army in the upper provinces, he was seized with illness, and died at Ghazapore, in the province of Benares, October 5, 1805. His character as a soldier and statesman was highly respectable; but he was more distinguished by diligence, humanity, and integrity, than by the higher mental qualities.

COROLLA, the name given by botanists to the innermost of the envelopes by which the organs of multiplication of many flowers are covered. Like the calyx [CALYX] it is composed of leaves changed from the ordinary state of those parts in consequence of an alteration in the office they have to perform, but liable to resume the state of common leaves if exposed to the effect of any disturbing cause. The corolla is usually thin, delicate, perishable, and both larger and more richly coloured than the calyx; hence the older botanists considered those qualities proper to the corolla, and applied the term to all cases in which they existed. But it is now known that the calyx is frequently in the same state, and hence the only distinction that is now made between calyx and corolla is to consider everything calyx which forms the exterior of two or more rows of floral envelopes, everything corolla that belongs to the inner rows, and when there is only one row, to refer that to the calyx, whatever the colour or texture of it may be.

There is little doubt that when a calyx is green and leafy, its business is principally to protect the corolla; and that a corolla, when large, thin, and brightly coloured, is intended to exercise some special influence upon the fertilizing organs of the flower; for while the respiratory action of the calyx when green is not distinguishable from that of common leaves, the corolla differs most essentially in the want of all power of decomposing carbonic acid; it absorbs oxygen

from the air, but does not part with it again in a pure state; on the contrary, it combines it with its carbon, and throws off the carbonic acid thus formed. But although there is this difference between the calyx and corolla in ordinary cases, the functions of the corolla are performed by the calyx when it has the appearance of a corolla, and *vice versa*. The peculiar functions of these parts are therefore performed indifferently by the one or the other according to their structure.

The leaves of which a corolla is composed are called petals; and the endless varieties of its form and structure depend principally upon the different manner in which those parts are united, or upon the proportions they bear to each other. A monopetalous corolla for instance, is composed of several petals joined more or less together by their edges; campanulate corollas originate from petals without a claw or unguis; tubular corollas from unguiculate petals. In a regular monopetalous corolla all the petals are of equal size, and are united in the same degree; in an irregular monopetalous corolla, the petals are unequal in size, and perhaps unequally united.

The corolla is generally the part of the flower in which grotesque forms are most frequently met with; such as horns or spurs projecting from the base; or a cowed figure, or dark hairy appearances resembling the bodies of insects, as in the bee larkspur, various orchidaceous plants, &c. The cause of these singular forms is entirely unknown; they appear to be specific cases, of which no explanation can be given.

For the theory of the structure of the corolla, the modification of its form, and other particulars, see De Candolle's *Organographie Végétale*, Mirbel's *Elémens*, Lindley's *Introduction to Botany*, and generally all elementary books of the higher kind written within the last five or six years.

COROLLARY (Corolla, 'a little crown') is frequently used for any necessary consequence of a proposition; but technically applied in geometry, it means a consequence which immediately follows from the demonstration of a proposition, without the necessity of introducing any other proposition. But all the corollaries in our editions of Euclid are annexed by editors, none of them being in the original. Those of book i., prop. 32, were added by Campanus; but the first use of the word which we know of is in the English translation of Billingsley. [DEE, JOHN.]

A corollary of any proposition (which call A), should, in consistency with the majority of writers, mean a proposition which cannot be false, unless some part of the demonstration of A, or some notion which the existence of A implies, be false. In this sense all the propositions of the fifth book of Euclid are corollaries of the definition of proportion.

COROMANDEL COAST—originally Cholomandala, or according to Major Rennell, the Sora Mandalum of Ptolemy—is the sea board of the western side of the bay of Bengal, extending from Point Calimere on the south, in 10° 18' N. lat. and 79° 56' E. long., to the mouth of the river Krishna on the north, in 15° 45' N. lat. and 80° 53' E. long. Through its whole extent, about 350 miles, this coast does not afford any secure port or harbour; and owing to the prevalence of the surf, it is difficult to effect a landing except by means of boats peculiarly constructed for the purpose. [CUDDALORE—MADRAS—PONDICHERY.]

CORON, a town in the Morea, on the west coast of the gulf of Kalamata, the antient Messenian gulf. It appears to stand at or near the site of the antient Colónides, while the town of Corone, of which Pausanias speaks as having been built by the Messenians when they were restored to their country by the help of the Thebans, would seem, by the description which that author gives of its locality, to have stood farther north on the same coast, near the spot where the village of Petalidhi now stands. The present Coron is a place of some trade, and exports oil and silk which are produced in the neighbouring district.

The town consists of a large castle in tolerably good repair, in which the Turkish inhabitants used to reside before the Greek revolution, the Greek population then occupying the suburb called Varusi. The roadstead is open and exposed to the south winds, but the bottom of the shore being soft sand, vessels driven upon it often escape without much damage. The town stands on a promontory surrounded by a fertile plain, which is divided from the district of Modon, on the west coast of the Morea, by a barren ridge which runs

north and south through the peninsula to Cape Gallo, antiently Acritas. (Leake's *Morea*, vol. i.)

CORONA. [COLUMN.]

CORONA BOREALIS AND AUSTRALIS, the northern and southern crowns. The first is a northern constellation, found in Aratus, who says it was formed by Bacchus in memory of Ariadne. It is situated between Bootes and Hercules, and the bright star of its cluster (marked α) may be seen about an hour eastward of Arcturus, and about eight degrees nearer to the pole. Corona Australis is a southern constellation, first found in Ptolemy. It is situated between the front legs of Centaurus.

CORONATION, the act of crowning or consecrating a king. This rite is of remote antiquity, as may be gathered from the notices which we have in Scripture, in the first and second books of Kings, of the coronations of Solomon, and of Joash the son of Ahaziah, of the latter of whom it is expressly said that Jehoiada the priest took him, put the crown upon his head, and gave him the testimony, and they made him king, and anointed him. The act of anointing seems to have originated with the Jews.

In England, after the kingdoms of the Heptarchy had become united, we find the ceremony of coronation continually alluded to in the Saxon Chronicle, under the term *zehlzod*, by which is expressed that the king was hallowed or consecrated. Kingston-upon-Thames was the place where the Saxon sovereigns were crowned during nearly the whole of the tenth century. (See Diceto and the other historians in the *Decem Scriptores*.) Edgar, who succeeded to the throne in 959, is said to have been crowned either at Kingston or at Bath. Edward the Confessor was crowned at Winchester in 1042. The copy of the Gospels upon which the Saxon kings were sworn at their coronations is believed to be still preserved amongst the Cottonian Manuscripts in the British Museum, in the volume Tib. A. ii. Harold and William the Conqueror were crowned at Westminster. It was customary with the Norman kings to be crowned more than once. Henry II. crowned his eldest son, and associated him with himself in the administration during his own life.

In one or two instances, in the Norman times, we find the regnal years of our kings dated from their coronations only; the previous time, between the predecessor's death and the performance of the inaugural ceremony, was considered as an interregnum. This is a fact of no small importance to those who would accurately fix the dates of public instruments and transactions in the reigns of Richard I., John, and their successors.

The first English coronation of which we have any detailed account is that of Richard I., in the Histories of Diceto and Bromton. (See Twysd., *Script.* x. coll. 647, 1157.) An account of all the formalities observed at that of Richard II., taken from the 'Close Rolls,' is to be found in Rymer's 'Fœdera,' the old edition, vol. vii. p. 157. Froissart has given a short but interesting narrative of the coronation of Henry IV., which the reader may see in the English edition of his 'Chronicle,' by Lord Berners, 4to., Lon-

don, 1812, vol. ii., pp. 753, 754. The details of the English coronations of Henry V. and VI., and of the latter in France, are contained in the Cottonian Manuscripts, Tib. E. viii. and Nero C. ix. Hall and Grafton have described the ceremonies at the coronation of Richard III. The account of the coronation of Henry VIII., with the king's oath prefixed, interlined and altered with his own hand, is likewise preserved in the Cottonian Manuscript already mentioned, Tib. E. viii. The oath, with its interlineations, is engraved in fac-simile in the first volume of the second series of Ellis's 'Original Letters illustrative of English History.' Fuller, in his 'Church History,' and Ellis's 'Letters,' 1st Ser., vol. iii. p. 213, detail the particulars of the coronation of Charles I. Several editions of the Form and Order of Charles II.'s coronation at Scone in 1651 were published at the time in 4to. at Aberdeen; reprinted at London in folio, 1660; and the entertainment of Charles II. in his passage through London to his coronation, with a narrative of the ceremony at the coronation, by John Ogilby, with plates by Hollar, fol., London, 1662. Sandford's 'History of the Coronation of James II.,' fol., London, 1687, illustrated with very numerous engravings, is the most complete of all our works upon English coronations published by authority. That of George IV., of which two portions only appeared, was far more splendid, with coloured plates, but remains unfinished.

A very antient MS. of the ceremonial of crowning the emperors at Aix-la-Chapelle was purchased at the last of the sales of Prince Talleyrand's libraries, by the late Mrs. Banks, and is now among the additional manuscripts in the British Museum. Of foreign published coronations, that of Charles V. at Bologna as emperor, in 1530, is one of the most curious, engraved in a succession of plates upon a roll of considerable length. Thé 'Sacre de Louis XV., Roy de France et de Navarre, dans l'Eglise de Reims, 25 Oct. 1722,' is a work of pre-eminent splendour, full of finished engravings. The 'Description of the Ceremonies at the Coronation of Napoleon as Emperor of France, with his Consort Josephine, 2 Dec. 1804,' is a work of equal size, but the engravings are chiefly in outline: folio, Paris, 1807. There is a volume, with engravings, of the coronation of the empress Anne of Russia, fol. Petersburg, 1731; and many others might be enumerated.

The formulary which has served as the general model for the English coronations since the time of Edward III. is the 'Liber Regalis,' deposited in the archives of the dean and chapter of Westminster, and kept with a religious care. It is supposed to have been written for the particular instructions of the prelates who attended at the coronation of King Richard II. and his queen. Copies of this manuscript, without its illuminations, are preserved in one or two of our manuscript libraries. The substance of the ceremonial directed in it is abridged in Strutt's 'Manners and Customs,' vol. ii. p. 22-37.

The following is the form of and ceremonial in administering the *Coronation Oath* to our kings:—Sermon being ended, and the King having made and signed the declaration, the Archbishop goes to the King, and standing before him, administers the Coronation Oath, first asking the King 'Sir, is your Majesty willing to take the Oath?' and the King answering, 'I am willing;' the Archbishop ministereth these Questions; and the King, having a Copy of the printed Form and Order of the Coronation service in his hands, answers each Question severally as follows:—

Archb. 'Will you solemnly promise and swear to govern the People of this United Kingdom of *Great Britain and Ireland*, and the Dominions thereto belonging, according to the Statutes in Parliament agreed on, and the respective Laws and Customs of the same?'

King. 'I solemnly promise so to do.'

Archb. 'Will you to your Power cause Law and Justice, in Mercy, to be executed in all your Judgments?'

King. 'I will.'

Archb. 'Will you to the utmost of your Power maintain the Laws of God, the true Profession of the Gospel, and the Protestant Reformed Religion established by Law? And will you maintain and preserve inviolably the settlement of the United Church of *England and Ireland*, and the doctrine, worship, discipline, and government thereof, as by Law established within *England and Ireland*, and the territories thereunto belonging? And will you preserve unto the Bishops and Clergy of *England and Ireland*, and to the United Church committed to their charge, all such rights

and privileges as by Law do or shall appertain to Them, or any of them?"

King. 'All this I promise to do.'

Then the King arising out of his Chair, supported as before, and assisted by the Lord Great Chamberlain, the Sword of State being carried before him, shall go to the Altar, and there being uncovered, make his solemn Oath in the sight of all the People to observe the premises: laying his right hand upon the Holy Gospel in the Great Bible, which was before carried in the Procession, and is now brought from the Altar by the Archbishop, and tendered to him as he kneels upon the steps, saying these words:

'The Things which I have here promised I will perform and keep, So help me God.'

Then the King kisseth the Book, and signeth the Oath. (See the *Form and Order observed in the Coronation of his Majesty King George IV.*, 4to., London, 1821.)

CORONER. The coroner (*coronator*) is an antient officer by the common law of England. The name is said by Lord Coke to be derived 'a coronā, because he is an officer of the crown, and hath conusance of some pleas which are called *placita coronæ*.' In this general sense the chief justice of the Court of King's Bench is by virtue of his office the supreme coroner of all England, and may, if he pleases, hold an inquest, or otherwise exercise the office of coroner, in any part of the kingdom. Lord Coke mentions an instance in which Chief Justice Fineux in the reign of Henry VII. held an inquest on the body of a man slain in open rebellion, 5 *Reports*, 51. In this sense also, the Master of the Crown Office in the Court of King's Bench, is styled the 'coroner or attorney for the king;' his business being confined to pleas of the crown discussed in that court. But the officers now usually understood by this term are the coroners of counties, who are of high antiquity, being said in one of the most antient treatises on the common law to have been ordained together with the sheriffs to keep the peace of counties when the earls gave up the wardship. (*Mirror*, c. i. § 3.) In early times too, the office appears to have been one of great estimation; for by the statute 3 Edw. I. c. 10, they are required to be knights, and by the 28 Edw. III. c. 6, they must be 'of the most meet and most lawful men of the county.' By the 14 Edw. III. st. 1. c. 8, 'no coroner shall be chosen unless he have land in fee sufficient in the county, whereof he may answer to all manner of people.' No peculiar qualification is now required, though Serjeant Hawkins seems to express an opinion that the persons chosen, though not knights, must be 'of good substance and credit.' (Hawkins's *Pleas of the Crown*, book ii., cap. 9.) Most commonly there are four coroners in each county; but the number varies according to the usage of different counties. There have been recent instances in which, upon a representation made to the lord chancellor by the magistrates, that the existing number of coroners was insufficient for the business of the county, writs have issued for the election of additional coroners. (See 3 Swanston's *Reports*, 181.)

Coroners of counties are elected under the direction of the stat. 28 Edw. III. c. 6, by the freeholders in the county court, in the same manner as sheriffs and conservators of the peace formerly were; the election takes place by virtue of an antient king's writ, *De Coronatore Eligendo*, returnable in chancery. A recent statute, the 58 Geo. III. c. 95, makes detailed provisions for conducting these elections. By that Act, the sheriff is to proceed to the election of a coroner at the usual place for such elections at the next county court, unless such court occurs within six days after the receipt of the writ; if it occurs within such six days, he is to adjourn the court for the purpose of the election to some convenient time, not exceeding fourteen days. If the election is not determined upon a view by the consent of the freeholders present, the sheriff shall take a poll, which may continue open for ten days (Sunday excepted). The reasonable expenses of the sheriff at the election are to be paid, in equal proportions, by the candidates. After his election is declared, the coroner takes an oath of office before the sheriff.

Coroners in counties are elected for life; but if they accept an office incompatible with the duties, such as that of sheriff, or dwell in a remote part of the county, or are incapacitated by age or infirmity, they are removable by means of the writ *De Coronatore Exonerando*; and by the stat. 25 Geo. II. c. 29, § 6, they may be removed upon con-

viction of extortion, wilful neglect of duty, or misdemeanor in their office. The great seal has authority however, independently of the above statute, to remove coroners for neglect of duty. (1 Jacob and Walker's *Reports*, 451.)

At common law the coroner had authority to hear and determine felonies; but his powers in this respect were expressly abrogated by Magna Charta, cap. 17. The most usual duty of a coroner is that of taking inquisitions of death; and though his duties, as well as his authority in this respect, are said to have existed at common law, they are declared by the 4 Edw. I. stat. 2, commonly called the statute *De Officio Coronatoris*. By the directions of that statute, 'the coroner, upon information, shall go to the places where any be slain, or suddenly dead or wounded, and shall forthwith command four of the next towns, or five or six, to appear before him in such a place; and when they are come thither, the coroner, upon the oath of them, shall inquire in this manner; that is to wit, if they know where the person was slain, whether it were in any house, field, bed, tavern, or company, and who were there; who are culpable, either of the act, or of the force; and who were present, either men or women, and of what age soever they be, if they can speak, or have any discretion; and how many soever be found culpable, they shall be taken and delivered to the sheriff, and shall be committed to the gaol; and such as be found and be not culpable, shall be attached until the coming of the judge of assize.' And it is declared by the same statute, that 'if it fortune any such man be slain, which is found in the fields or in woods, first it is to be inquired whether he were slain in the same place, or not; and if he were brought and laid there, they should do so much as they can to follow their steps that brought the body thither, whether he were brought upon a horse or in a cart. It shall also be inquired if the dead person were known, or else a stranger, and where he lay the night before.' It is declared also by the same statute, that 'all wounds ought to be viewed, the length, breadth and deepness; and with what weapons; and in what part of the body the wound or hurt is; and how many be culpable; and how many wounds there be; and who gave the wound.' In like manner it is to be inquired by the coroner 'of them that be drowned, or suddenly dead, whether they were so drowned or slain, or strangled by the sign of a cord tied straight about their necks, or about any of their members, or upon any other hurt found upon their bodies. And if they were not slain, then ought the coroner to attach the finders and all other in the company.' The provisions of this ancient statute are still in force, and are to be followed by coroners in all their particular directions as nearly as possible at the present day in inquisitions of death. In case of a death happening upon the high sea, inquisitions are taken before the Admiralty coroner, who is appointed by the king or the Lord Admiral; and the county coroners have in such a case no jurisdiction. The inquisitions taken before the Admiralty coroner are returned to the Commissioners of the Admiralty under stat. 28 Hen. VIII., c. 15.

The coroner has authority to assemble a jury by means of a precept to the constables of the hundred or adjoining township, and the names of jurors who make default may be returned by him to the judges of assize, who may fine them. When the jury are assembled, they are charged and sworn by the coroner to inquire, upon view of the body, how the party came by his death. The coroner has no authority to take an inquisition of death, except upon view of the body by himself and the jury; and if he does so, the inquisition is wholly void. (*Rex v. Ferrand*, 3 Barn. and Ald. *Reports*, 260.) If a body liable to an inquest has been buried before the coroner has notice of the circumstances of the death, he has authority to cause it to be disinterred for the purpose of holding the inquest, provided he does so within a reasonable time. By a recent statute (7 Geo. IV. c. 64, § 4), which repeals an antient enactment on this subject, it is provided that 'every coroner, upon any inquisition before him taken, whereby any person shall be indicted for manslaughter or murder, or as an accessory to murder before the fact, shall put in writing the evidence given to the jury before him, or as much thereof as shall be material; and shall have authority to bind by recognizance all such persons as know or declare anything material touching the said manslaughter or murder, or the said offence of being accessory to murder, to appear at the next court of oyer and terminer, or gaol delivery, or superior criminal court of a

county palatine, or great sessions, at which the trial is to be, then and there to prosecute or give evidence against the party charged; and every such coroner shall certify and subscribe the same evidence, and all such recognizances, and also the inquisition before him taken, and shall deliver the same to the proper officer of the court in which the trial is to be, before or at the opening of the court.' And by a subsequent section, authority is given to the court to which the inquisition ought to be delivered to examine in a summary manner into any offence committed by the coroner against the act, and to punish him by fine. The coroner's inquisition may be removed into the Court of King's Bench, and the facts found may be traversed by the personal representative of the deceased; or the court may make it for any apparent defect.

For every inquisition taken in any place contributing to the county rates, the coroner is entitled to a fee of 20s., and also to 9d. for every mile he is obliged to travel from his usual place of abode for the purpose of taking it, to be paid by order of sessions out of the county rates. By a recent act of parliament, 6 and 7 Will. IV., c. 89, the coroner is empowered to order the attendance of legally-qualified medical practitioners upon an inquisition of death, and to direct the performance of a *post mortem* examination; and if the majority of the jury are dissatisfied with the first examination, they may call upon the coroner to summon a second medical witness, to perform a *post mortem* examination, whether it has been performed before or not. The statute also authorizes the coroner to make an order for the payment of a fee of one guinea to such witness, if he has not performed a *post mortem* examination, and of two guineas if he has performed such examination. Medical practitioners are also liable to a penalty of 5l. if they neglect to attend.

The coroner has also occasionally to exercise a ministerial office, where the sheriff is incapable of acting. Thus where an exception is taken to the sheriff on the ground of partiality or interest, the king's writs are directed to the coroners. This incident to the office of coroners points distinctly to their antient character as ministerial officers of the crown.

By the Municipal Reform Act, 5 and 6 Will. IV. c. 76, § 62, the council of every borough, to which a separate court of quarter sessions has been granted, is empowered to appoint a fit person, not being an alderman or councillor, to be coroner of the borough, who is to hold his office during good behaviour. The fees and general duties of borough coroners are the same as those of county coroners; but the former are required by the statute to make an annual return to the secretary of state of all inquests of death taken by them. [DEODAND.] (See Hawkins's *Pleas of the Crown*, book ii., cap. 9; Burn's *Justice*, tit. 'Coroner;' and Jervis's *Practical Treatise on the Office and Duties of Coroners*.)

CORONET, an inferior kind of crown worn by the nobility. Of coronets worn by foreign nobility much may be seen in Selden's 'Titles of Honour,' and in Montfaucon; see also Gough's 'Sepulchral Monuments,' vol. i. pp. 133, 134. No coronets belonging to peers can be found in England earlier than the time of Henry III. The coronet seems at first to have been the distinctive mark of an earl. William de Valence, earl of Pembroke, who died in 1304, and is buried in Westminster Abbey, has only a plain fillet. Aymer de Valence, however, acknowledged by his treasurer the receipt of a coronet at his creation of earl in 1319. (See Gough, *Sep. Mon.*, i. p. 86, from Selden's *Tit. of Hon.*) John of Eltham, second son of Edward III., who died in 1334, and is also buried in Westminster Abbey, has a coronet on which are leaves; it is the most antient of the sort we meet with. Edward the Black Prince, who is buried at Canterbury, has his helmet adorned with a coronet of oak-leaves, formerly enriched with paste, or false stones, of which the collets only remain. (Ibid. i. 136.)

Of the coronets of the British nobility, as at present worn, all surround caps of crimson velvet turned up with ermine. That of a duke is a circle of gold, richly chased, having on the edge eight strawberry leaves of equal height: that of a marquess, a circle set round with four strawberry leaves and as many pearls on pyramidal points of equal height, alternately: the earl's coronet has eight pyramidal points (five only being seen at a time), with as many pearls on the tops, placed alternately with as many strawberry leaves, lower than the pearls. The viscount has only pearls, with-

out any limited number, placed on the circle itself all round. A baron has only six pearls set at equal distance. Viscounts and barons had no coronets allowed them till after Queen Elizabeth's reign; the former had them granted by king James I., the latter by a grant from Charles II. in the thirteenth year of his reign. In Sir Symonds D'Ewes's letter, giving an account of the coronation of king Charles I. (already referred to under CORONATION), it is expressly said that when the higher order of the peerage put on their coronets, the barons sate bare.

The coronet of the kings of arms is a plain circle of gold, bearing sixteen leaves, eight of which are higher than the others: and on the band, the motto 'Miserere mei, Deus.'

CORO'NULA. [CIRRIPEDA.]

CORPORAL (in the French service *caporal*), a non-commissioned officer in a battalion of infantry. The word is derived from the Italian *capo*, signifying a head; and the title denotes that the person who bore it was the chief of a small squadron or party. During the reigns of Mary and Elizabeth, the corporal was a kind of brigade-major; he superintended the marches of the companies, and commanded the troops who were sent out on skirmishing parties. But at present he is immediately under the sergeant; he places and relieves the sentinels, and at drill he has charge of one of the squads. In the ranks he does the same duty as a private soldier, but his pay is rather higher.

Lance-corporal, originally *lance-spesata*, denoting a broken or spent lance, was a term applied to a cavalry soldier who had broken his lance or lost his horse in action, and was subsequently retained as a volunteer in the infantry till he could be remounted. He is now merely a soldier who does the duty of a corporal, but without the pay, previously to obtaining the full appointment to that grade.

CORPORATION. For the purpose of maintaining and perpetuating the uninterrupted enjoyment of certain powers, rights, property, or privileges, it has been found convenient to create a sort of artificial person, or body-politic, not liable to the ordinary casualties which affect the transmission of private rights, but capable, by its constitution, of indefinitely continuing its own existence. This artificial person is in our law called an *incorporation*, *corporation*, or *body-corporate*. The last of these names is the most correct, as well as the earliest, that occurs in our law. The former import rather the act of creating the body than the body itself, and do not appear to have been used in their modern sense till the fifteenth century. The institution of such bodies under similar or different names was common among the Romans [COLLEGIUM], and we believe we may venture to say that bodies possessing all the essential characteristics of modern corporations were known in the Greek polities.

Corporations are variously distinguished into aggregate and sole corporations, corporations ecclesiastical and lay, civil and eleemosynary, regular and secular. Again, they are divisible into corporations of a public character established for the purpose of general or local government, and those which have been created to facilitate the object of private associations.

The idea of a corporation *sole*, formed by a succession of single persons, occupying a particular office or station, and each in virtue of his character succeeding to the rights and powers of his predecessor, has been said to be peculiar to our law, and to be an improvement upon the original invention. (4 Blackstone's *Comment.* 469.) The king, a bishop, a parson, the chamberlain of London, &c. are usually referred to as examples of such corporations sole. It may be observed, however, with respect to the supposed novelty of the invention, that similar cases of official succession and representation probably occur in almost every system of laws, so that the claim of originality must be restricted to the mere name; and even in this respect, we incline to the opinion of Dr. Wooddesson, 'that as so little of the law of corporations in general applies to corporations-sole, it might have been better to have given them some other denomination.' (1 Wooddes. *Vin. Lect.* 471, 2.) The following notice will be chiefly confined to the law of corporations-aggregate.

The members of cathedral and collegiate chapters are examples of secular ecclesiastical corporations-aggregate. Before the reformation the law recognised a class of eccle-

siastical corporations-*regular*, consisting of abbots or priors and their respective convents, and, as it should seem, the societies of friars or mendicant orders. (Brooks' *Abr. Corporations*, pl. 12.) The heads of these conventual bodies were often distinct corporations-sole, as is still the case in many of the modern secular ecclesiastical establishments.

Colleges, in or out of the universities, and incorporated schools and hospitals, are instances of eleemosynary corporations; being endowed and established for the purpose of perpetuating the bounty of their respective founders.

But the largest class of corporations, and those which are most varied in their object and character, are lay and civil incorporations. Among these may be reckoned the universities, the municipal governments of different cities and boroughs, the East India Company, the Bank of England, the Colleges of Physicians and of Surgeons, the Royal Society and Academy, the Society of Antiquaries, and an infinite variety of commercial and other companies erected by charter or by act of parliament.

A corporation cannot be created by any authority except that of the king or the parliament. Where any such body has existed from time beyond memory, it is presumed to have a legitimate origin in one or the other of the above sources. As a matter of curiosity it may be noticed here, that until the period of the Reformation the pope and the bishop of the diocese were considered necessary parties to the foundation of any new society of monks or *regular* clergy. The refusal of the former to confirm the foundation of Sion Monastery in the reign of Henry VI. is known to have caused an alteration in the original plan of that establishment. (Cotton's *Abridgment*, 589.)

The principal incidents and attributes of a corporation-aggregate are the following:—

1. It can purchase, convey, and hold land or goods in perpetual succession, notwithstanding the changes and fluctuations that occur among the members successively appointed to fill the vacancies which happen in it.

2. It can become a party to proceedings at law, or to contracts, by the corporate name given to it on its foundation.

3. The act or assent of the majority is binding on all the rest; such at least is the general rule, wherever the instrument of foundation does not otherwise provide.

4. It signifies its assent, and testifies its corporate acts, by a common seal, without which hardly any voluntary contract is binding on the body politic.

5. It is competent to enact regulations called bylaws, binding on the members of the corporation, and, in some cases, on strangers within the scope of their jurisdiction. [BYLAW.]

6. The particular members of the body are not in general personally responsible for the acts, contracts, or defaults of the corporation. This exemption from individual liability makes it very desirable for commercial and other trading companies to obtain charters of incorporation, by which the members escape the risk of ordinary partnerships.

7. The personal defaults or misconduct of its members cannot in general be visited on the corporate body.

With respect to some of these incidents, it should be observed that the capacity of holding land is restrained by the statutes of mortmain, which make it necessary to obtain an express license to that effect from the crown or the legislature. This is agreeable to the Roman law, which forbids aggregated bodies of this kind 'hereditatem capere sine speciali privilegio.' [MORTMAIN.]

So with regard to the exemption from personal responsibility in respect of corporate acts, it must not be supposed that the members of the body can directly authorize an injury to be done to another under the sanction of a corporate act, without incurring the usual personal consequences. Thus, if a corporation should by an instrument under the common seal direct a trespass to be committed on a third person, every member of the majority who was present, and actually assenting to the act, would be liable in his private capacity.

The mode of filling up vacancies which occur in the constituent members of the body politic, is in every case determined either by the express provisions of the charter of incorporation, or (in the case of immemorial corporations) by ancient usage. The most common and regular method of maintaining the succession is by election. Sometimes the successor is appointed by the crown, or by a patron or founder. In the case of ecclesiastical corporations the

forms of election are in many instances preserved, but the substantial right of nomination has long been exercised either by the crown or by some authority or person independent of the chapter or other corporate body.

With a view to ensure the performance of those duties, and a strict adherence to those regulations which are imposed upon corporate bodies either by the will of their founders or the general tenor of their charters, the law has appointed certain persons and courts, whose office it is to exercise a coercive power of superintendence and correction.

In the instance of eleemosynary bodies, as colleges, schools, and hospitals, the person so appointed is called a *visitor*, and is either the heir of the original founder, or some person specially assigned by him, or (in the absence of either of these) the king. [COLLEGE.]

In ecclesiastical corporations, the bishop of the diocese is, of common right, the visitor. His right of visitation formerly also extended over all the monastic establishments within the same district, unless the abbot or other head of the convent had purchased a papal bull of exemption, the effect of which was to subject him to the sole superintendence of the pope himself. With regard to other lay corporations, such as municipal corporations, trading companies, and similar bodies, their irregularities are left for correction to the ordinary courts of justice, which upon a proper application to them will be found to possess powers abundantly adequate to that end.

Having treated of the creation and incidents of corporations, let us now consider how they may be dissolved.

1. A corporation may be extinguished by the natural death of all the members of it.

2. Where a select body of definite number, constituting an integral part of the corporation, is so reduced by death, or other vacancy, that a majority cannot be present at corporate meetings, the whole body becomes incapable of doing any corporate act, and, according to the better opinion, the corporation is thereby extinguished. This is the result of a rule in corporation-law,—that every act must be sanctioned, not only by a majority of the number actually present at a meeting, but also at a meeting composed of a majority of each definite body into which the corporation has been subdivided by the charter. Thus, if a corporation consists of a mayor, twelve aldermen, and an indefinite number of burgesses, at least seven aldermen must be present at every meeting; nor can a legal meeting be convened in the absence of the mayor, except for the purpose of electing a new one. The tendency of the rule is to compel the elective body to fill up vacancies without delay, and to secure the attendance of a competent number when the public business is transacted. The rule is inapplicable to a body of *indefinite* number, such as the general body of freemen; and it is liable to be modified and controlled by the charter, or other fundamental constitution of the corporation. The rule of the civil law, requiring the actual presence of two-thirds of the corporation at elections, seems to have been dictated by a similar policy: but Sir W. Blackstone (*Commentaries*, vol. i. p. 478) is in error, when he supposes that a bare majority of the body so assembled could not bind the rest. (See Pancirollus, *de Magist. Municip. apud Grævium*.)

- 3rd. A dissolution may be effected by a formal surrender to the crown; at least where the incorporation is by charter, and where all persons interested in it are concurring and competent parties.

- 4th. A corporation may be forfeited, where the trust for which it was created is broken, and its institution perverted. Such a forfeiture can only be declared by judgment of the superior courts on process issued in the ordinary course of justice, in which the fact of misuser, if denied, must be submitted to a jury.

Having already alluded to the religious corporations of monks and other regular clergy formerly existing in this country, we may here observe that the validity of the surrenders obtained by the crown at their suppression was deemed sufficiently doubtful to require the confirmation of an express act of parliament. Even then, in the opinion of the canonists, the *spiritual* incorporations still continued until suppressed by competent spiritual authority, and were capable of perpetuation, although their possessions were lost, and their civil rights extinguished. Hence it was that the Brigettine nuns of Sion, suppressed by Henry VIII., restored by Queen Mary, and again ejected by her successor, continued to maintain a migratory existence for two

centuries and a half in Holland, Belgium, France, and Portugal, and still claimed to be the same convent which Henry V. had founded on the banks of the Thames. (See letter of the Abbé Mann, 13 *Archæologia*.)

Under **BOROUGHs OF ENGLAND AND WALES** will be found a more particular description of that class of corporations which have been erected in this country for the purpose of local municipal government, and of the recent legislative changes which their constitution has undergone.

CORPORATION AND TEST ACTS. [**BOROUGHs OF ENGLAND AND WALES**, vol. v. p. 202.]

CORPORATIONS (MUNICIPAL) OF IRELAND.

The borough system of Ireland may be described in general as an immediate branch from that of England, which, at the same time that it has amply shared the effects of the policy of the crown in latter ages towards municipal bodies in general, has also been modified by the very peculiar and often fluctuating political circumstances of that division of the British empire. The motives which actuated the executive government of England in the course which it so long and so steadily pursued towards the entire remodelling of the town constitutions, and the operation of that course of proceeding in undermining the independence and destroying the local benefit of the municipal governments, we have endeavoured to trace distinctly in a preceding article [**BOROUGHs OF ENGLAND AND WALES**]. In this place, therefore, the historical part of our notice must be limited chiefly to the marking, in the general course of Anglo-Irish history, the progress of the Irish corporation system in particular.

The whole system of boroughs, which holds so conspicuous and important a place in the history of the political and general civilization of the British Islands, is, in nature as well as name, of purely Teutonic original; that particular species of organization having ever been found repugnant to the habits and spirit of the Celtic nations in their independent state. Thus, in Great Britain itself, its local limits advanced with the growth and extension of the Germanic colonies both north and south of the Tweed; and in Ireland we find that the native race were strangers to it until the settlement on their eastern and southern coasts, about the ninth century, of some of those Danish, North-man, or, as they were called in Ireland, Ost-man (East-man) bands, in that great æra of the permanent migrations of those formidable sea-rovers. Of these maritime settlements, five, viz., Dublin, Wexford, Waterford, Cork, and Limerick, appear as places of note at the commencement of the Anglo-Norman conquests in the island, and as possessing that municipal organization which constantly attended all the branches of the Teutonic race. The Ost-man colonists of Ireland, too, though for a considerable time after their first settlement they adhered to their antient paganism, had at the period in question, owing undoubtedly to the amicable relations which had arisen between them and the Irish population, and to the exertions of the Irish clergy, been long in the profession of Christianity; so that, it should seem, the first Anglo-Norman invaders might have recognised in them some degree of national affinity. But being ignorant and brutal, though subtle and daring adventurers, their thirst for plunder and for territorial acquisition would not permit them, in their career of murderous rapine, to make any distinction in treatment between the Scandinavian and the Celtic blood, between the Ost-man and the Irishman.

This unsparing temper of the early private invaders perfectly coincided with the policy of the English crown; and so soon as Henry II. had found leisure to take the business of the invasion into his own hands, one of his principal measures for securing the footing of his government on the Irish soil was the colonization of the Ost man ports with English or Anglo-Norman settlers. Thus the Ost-men of Dublin were thrust without the walls of their city to inhabit the suburb thence called Ost-man town, and still, by corruption, Oxmantown, giving place to a band of mercantile settlers from Bristol, who became the English king's 'burgesses' of Dublin, with a charter of liberties modelled exactly upon that of Bristol. In like manner, during the various fluctuations of the territorial conquest, down to its completion at the close of the reign of Elizabeth, every permanent extension of the English frontier extended the English organization of the territory, of which the establishment of fortified towns, with inhabitants municipally organized and trained to arms, was a constant and a pro-

minent feature. Of such of the municipalities established during that long period as still exist, or have left distinct traces, we give an enumeration from the report of the commissioners on the Irish branch of the late municipal inquiry. They are 45 in number, viz., Ardee, Ardfert, Athboy, Athenry, Bannow, Callan, Carlingford, Carlow, Carrickfergus, Cashel, Clonmel, Cork, Dingle, Donegal, Drogheda, Dublin, Duleek, Dundalk, Dungarvan, Feathard (county of Tipperary), Fore, Galway, Gowran, Inistiogue, Irishtown, Kells, Kildare, Kilkenny, Kilmallock, Kinsale, Knocktopher, Limerick, Maryborough, Naas, Navan, New Ross, Old Leighlin, Philipstown, Roscommon, Taghmon, Thomastown, Trim, Waterford, Wexford, Youghal.

The municipal commissioners could not help observing the 'marked distinction in the language of their charters, as to the constitutions of the municipal corporations in Ireland, according to the dates of those instruments,' that is, according as they were granted before or after the commencement of the reign of James I. The source of this remarkable difference will be found clearly explained on referring to the historical part of our account of the '**BOROUGHs OF ENGLAND AND WALES**,' (vol. v., p. 202,) where it will be seen that this was precisely the period when the crown was most actively exerting itself to secure the power of moulding the borough constitutions at its pleasure; and that in the middle of James's reign was given the notable judicial decision in favour of the prerogative of establishing close boroughs by charter, upon which the crown ever afterwards acted. In the same historical summary it appears that, far as the exercise of this power was carried in England, yet, in the hands of the Stuarts at least, it failed of the complete attainment of its object. But in Ireland, which presented a much clearer field for its exertion, it was used both lavishly and effectually, not only in establishing new boroughs, but in reframing the constitutions of the old ones. In the 'plantation of Ulster,' as the settling of British inhabitants upon the lately-forfeited lands there was then denominated, by charters granted by James to various 'undertakers' of the plantation, a number of incorporations were made beforehand, on the new and approved plan of towns 'to be built' on the respective lands. Another and very similar mode of making boroughs in Ireland at this period was the incorporating of some village already existing, at the same time placing its corporation under the absolute control of the lord of the manor existing previously or newly erected. The whole number of boroughs thus created by James I. and his two immediate successors, a large proportion of which were originally of the class just described, though some of them have since risen to importance, is 61, viz., by James I., Agher, Armagh, Askeaton, Athlone, Athy, Ballinakill, Ballyshannon, Baltimore, Bandonbridge, Bangor, Belfast, Belturbet, Boyle, Carrick-on-Shannon, Castlebar, Cavan, Charlemont, Clogher, Cloghnakilty, Coleraine, Dungannon, Ennis, Enniscorthy, Enniskillen, Feathard (county of Wexford), Gorey, Hillsborough, Jamestown, Kilbeggan, Killileagh, Killybegs, Lifford, Lismore, Londonderry, Lymavady, Mallow, Monaghan, Newry, Newtownards, Sligo, St. Johnstown (county of Donegal), Strabane, Tallagh, Tralee, Tuam, Wicklow; by Charles I., Banagher; by Charles II., Balinglass, Blessington, Cariesfort, Castlemartyr, Charleville, Dunleer, Granard, Harristown, Lanesborough, Longford, Middleton, Portarlinton, St. Johnstowne (county of Longford), Tulske.

Each of the 106 corporations in the two lists given above, sent two members to the Irish House of Commons, and many of those in the latter list served scarcely any other purpose from the beginning, their incorporation having been little more than a cover for the nomination of the two members by the landed proprietor. Many had consequently fallen into virtual disuse long before the legislative union with England. All however seem to have exercised some municipal function within the last century, excepting these seven,—Baltimore, Clogher, Dungarvan, Lismore, Mallow, Newry, Tallagh. With respect to the five following, the existence in them either of a corporation or of burgage tenure is noticed in antient records, but no charter of incorporation has been discovered, viz., Clonmines, Downpatrick, Ratoath, Swords, Taghmon, each of which likewise sent two representatives to the Irish parliament.

The mode of incorporation adopted by the crown in erecting the modern boroughs, presents little more than a parallel to the course it was pursuing in England; but in

order to explain how it was that the subversion which it effected in the *antient* borough constitutions of Ireland was so much more rapid and more complete than in those of England, we must advert to some very remarkable features in the politico-religious history of Ireland.

In the very first establishment of boroughs in that country, the Anglo-Norman crown had found itself under an absolute necessity of placing the new municipalities on the footing of the most favoured class of boroughs in England: the security of the English power upon the Irish soil required that the incorporated burgesses should be strong and prompt for defensive warfare; and, to be so, it was essential that they should be free. Not only therefore were the municipal and the parliamentary franchise enjoyed by the inhabitant householders at large, but their common exemption from burdensome duties and services, and from feudal jurisdictions, was rendered more effective than in England itself: and such, on the whole, did the civil condition of the Anglo-Irish boroughs continue to be until the completion of the territorial conquest. This completion, while it relieved the antient boroughs from the danger of external attack from the unsubdued native Irish population, rendered their internal freedom more liable to attack from the English crown, at length relieved from the risk and embarrassment of the old contest with 'the Irish enemy.' Another remarkable circumstance appeared just at the same period, which, while it commenced an entirely new æra in Anglo-Irish history, placed in the hands of the English government a weapon of sweeping efficiency for the prosecution in Ireland of its new policy towards antient boroughs in general. When Henry VIII. had abolished, to his own advantage, the papal supremacy in England, the new religious reformation, though received without difficulty by that small portion of the Anglo-Irish population which had close connexions with the English government, made little progress among that population at large: the great majority adhered as steadfastly to Catholicism as the native Irish themselves, and thus became involved with them in one and the same political proscription. To avoid giving a false colour to the whole subsequent tenor of Anglo-Irish history, it is most important to observe distinctly, that ever since the permanent establishment of the Church of England reformation, the great source of insolent political ascendancy on the one hand, and indignant political exclusion on the other, has been the difference, not of *racés*, but of *creeds*; and that of the *English* blood now existing on the Irish soil, far the greater portion circulates in the veins of those who are still subjected to political depression on *religious* grounds alone. In the reign of Elizabeth two statutes were passed relating to the crown's religious supremacy and to the uniformity of common prayer; but her government was too discreet to enforce either of them, except as to the clergy and the leading officers acting in civil capacities under the government. But James I. sent presidents or military governors through the Irish provinces for the immediate enforcement of the statutes in question, especially in the corporate towns; and from the language of the historians who panegyrize these presidents, we find that their threat was 'to cut with King James's sword King John's charters in pieces; to level the cities with the ground, and strew them with salt.' On arriving at these towns, they called before them the mayors and other principal corporate officers, and, after some further proceedings, deposed them, imprisoned them during his majesty's pleasure, imposed on them heavy pecuniary penalties, and for payment of these had their goods sold in the public streets. For a knowledge of these latter proceedings we are not indebted to historians, but the detail exists in reports exultingly made by the presidents themselves to the government of the day. The leading municipal officers being thus ejected, others, of known pliancy, were substituted in their places; and these persons readily resigned the rights and liberties of their towns into the king's hands, and took out new charters of incorporation. And here it was that the leading object of the crown was accomplished. To the several antient boroughs new charters were soon issued, so framed as to leave but a very small share of municipal power to the great body of the inhabitants. In these charters individuals were expressly nominated to fill the offices of mayor, sheriff, recorder, &c.: the members of the governing council of the corporations were in most instances nominated in like manner, with exclusive power to appoint their successors; so that the inhabitants at large were almost

wholly deprived of that share in their local government which, under the original constitutions of these boroughs, they had enjoyed for upwards of four centuries.

The system of exclusion was closely pursued by the persons thus newly placed in corporate authority, who, by this means, gradually severed their interests from those of the inhabitants at large: still they were unable wholly to extinguish the municipal rights of the antient class of freemen, who, though excluded by test oaths from the higher corporate offices, continued pretty numerous until the year 1654, when the army of the Commonwealth obtained possession of all such towns. No sooner was Charles II. restored than the Lords Justices of Ireland issued a proclamation confirming to every one holding by grant or contract with 'the late usurped powers,' all their lands and possessions, as well in towns as elsewhere, during a given period. Under the authority of this proclamation, when the Irish legislature was called together for the general arrangement of landed property, and other public interests, which had been completely subverted by so many years of civil war, the Commonwealth soldiery, who, under Cromwell, had possessed themselves of the walled towns, were able to return an overwhelming majority of members to that parliament which passed the Acts of Settlement and Explanation. The permanence of their interest was thus provided for; and the estates, rights, and liberties of those corporate establishments were vested in a body of men but recently settled in the kingdom. The unjust exclusion consequently maintained, became, in the course of the same reign, a subject of inquiry with the Irish government; but, wavering as that government has so often been between justice and expediency, it procured no effectual change in that system, the evils of which it seemed to deplore.

One measure, however, was taken at this period, the tendency of which was to mitigate in some degree the spirit of absolute exclusion prevailing in the Irish municipalities. The Act of Explanation empowered the Lord Lieutenant and Council, within seven years, to make rules, orders, and directions, for the better regulation of all cities, walled towns, and corporations. By virtue of this power, the Lord Lieutenant and Council, in 1672, issued what are called the 'New Rules,' which ordained that thenceforward the elections of persons to serve the offices of mayor, sheriff, recorder, or town-clerk, of Dublin, Limerick, Galway, and the several other towns therein mentioned, should be subject to the approbation of the Lord Lieutenant and Council; and that no person should be capable of acting as mayor, recorder, sheriff, treasurer, alderman, town-clerk, common-councilman, or master or warden, until he should have taken the oath of supremacy, except such only with whose taking that oath the Lord Lieutenant should think fit, by name and in writing, to dispense. But that part of these New Rules which tended to restore the antient basis of the municipal franchise, was a provision that all 'foreigners, strangers, and aliens, being merchants, or skilled in any mystery, craft, or trade,' then or thereafter residing and inhabiting within those cities or towns, should, on paying down a fine to the mayor and common council, or other persons authorized to admit freemen, be admitted to the freedom of such city or town respectively, and if they desired it, into any guild, brotherhood, &c., therein; that any person refusing to admit them so applying for their freedom should, upon due proof before the Lord Lieutenant and Council, be for ever deprived of the freedom of such city or town; and further, that on such refusal of admission by the corporate authorities, such person so applying should, on tendering twenty shillings, and taking the oath of allegiance before any justice of peace in the adjoining county, be therefore deemed, to all intents and purposes, a freeman of such corporation, guild, &c. Thus, in spite of the exclusive system then in operation, every resident trader in the corporate towns of Ireland was enabled, under these rules and orders, to become a freeman; though still, except by special dispensation, he could not fill the higher municipal offices, unless by taking the oath of supremacy and giving the other tests then required.

But after the Revolution of 1688, the spirit and intention of this portion of these rules were wholly disregarded. Owing, indeed, in some degree to James II.'s unsuccessful attempts against his opponents in the corporate towns of Ireland, the system of absolute exclusion pursued in the early part of his brother's reign was revived with aggravated rigour; and under such circumstances little was to

be expected from seeking the benefit of the rules and orders, or bringing in any other mode the rights of the excluded before such tribunals as then existed. From these causes, and from a sort of inviolability or sacredness of character which was thrown about corporate establishments in Ireland from the reign of William III. almost to the present time, the inhabitants at large of municipal towns have remained wholly unconnected in interests or feelings with the few individuals monopolizing all corporate authority.

The inquiry into the state of the municipal corporations of Ireland, commenced in 1833, was a branch of the general municipal inquiry which naturally followed the passing of the parliamentary Reform Acts. The Irish Commissioners took as the basis of their local investigations the 117 places which sent representatives to the Irish parliament; all of which have been enumerated in the several lists given above, except the six following, which, though they were empowered by charter to return each two members to parliament, appear never to have possessed a municipal character; viz., Antrim, Doneraile, Lisburn, Mullingar, Randalstown, and Rathcormac. And of the various municipal corporations above mentioned, only sixty appear to be now effectively existing and exercising corporate functions. These we shall here enumerate in the order of their respective magnitudes, commencing with the most populous, and descending regularly downwards: they are, of 100,000 inhabitants and upwards, Dublin, Cork; from 100,000 to 50,000, Limerick, Belfast; from 50,000 to 20,000, Galway, Waterford, Kilkenny, Londonderry; from 20,000 to 10,000, Drogheda, Sligo, Clonmel, Kinsale, Athlone, Youghal, Wexford, Dundalk; from 10,000 to 5000, Bandonbridge, Tralee, Armagh, Carlow, Carrickfergus, Ennis, Cashel, Tuam, Callan, Enniskillen, Enniscorthy, Coleraine, New Ross; from 5000 to 3000, Charleville, Strabane, Longford, Athy, Navan, Dingle, Kells, Ardee, Monaghan, Naas, Cloghnakilty, Dungannon, Boyle, Feathard (co. Tipperary), Trim, Maryborough, Portarlington, Gorey; from 3000 to 1000, Thomastown, Bangor, Wicklow, Middleton, Belturbet, Kilbeggan, Baltinglass, Hillsborough, Athenry, Kilmallock, Killileagh; from 1000 to 900, Inistioge, Castlemartyr. Of the extinct corporations, 30 have become so since the legislative Union with Great Britain; these vary in population from 6000 downwards; but the greater part of them are under 1000, and several are inconsiderable villages.

In Ireland, the total inadequacy of the present basis of municipal constituency is yet more universally glaring and more injuriously operative than it was in the unreformed system of England. 'The rights from birth, marriage, and apprenticeship,' say the Irish Commissioners, 'have, even where most liberally admitted, failed to supply in the body of the corporations, a general constituency comprising or representing sufficiently the various classes of the inhabitants. The two former qualifications are necessarily limited to persons related to, or connected with, the old members; and the last (apprenticeship) leaves to the old members complete control as to the class from which the new may be selected: thus, when a particular party has gained an ascendancy, these rights operate to preserve the corporate privileges to that party exclusively. The modes of admission which have become established in most corporations have further contributed to limit the number of freemen, and prevent the foundation of a general and comprehensive commonalty.... Possessed of these powers, the governing bodies have too commonly used them, without scruple, not as trusts to be exercised for the benefit of the community, but as the means of attaining for themselves an exclusive dominion over the general inhabitancy, and political influence in the election of members of parliament. The course which they seem to have almost universally pursued for this object has been to concede with the utmost parsimony to the inhabitants the right to become members of the corporations as freemen. Where the recognised rights to freedom are not directly resisted, difficulties are interposed to its attainment; in some cases, by the establishment of peculiar forms of admission, as in Bandonbridge, Dublin, and Drogheda, which give to the governing body, or some of its members, a direct power of negating or suppressing the claims. In others, as in Kilkenny and Limerick, unnecessary delays or technical obstacles have been interposed in the investigation and consideration of the title to admission; while the power of admission by especial grace may at all times be exercised without limit, to

counteract any increase on title supposed to be dangerous to the prevailing influence. The policy of the governing bodies has induced some of them, in recent instances, to endeavour to retrace their steps, and extend more liberally the corporate franchise, with the view of encountering the enlarged leasehold and household constituency introduced by the Reform Bill. Thus, in Clonmel, rights to freedom not recognised for eighty years prior to that Act being passed, have been since admitted. In Dundalk it was attempted to introduce a right of admission by birth, but unsuccessfully. In Waterford the same policy has led to the relaxation of restrictions previously existing on the attainment of freedom as of right. In Kinsale and Athlone, freemen were admitted in large numbers in 1831 for the same purpose, but the attempt was defeated by the provision of the Reform Act excluding honorary freemen admitted subsequently to the 30th of March in that year.'

The excessive abuse of the unlimited power of admitting non-residents into the local constituency, is a feature still more strongly marked in the character of the Irish corporations than in that of the English. 'In counties of cities and counties of towns,' say the commissioners, 'the acknowledged rights of the *freeholders* to vote at elections for members of parliament, while it has served to maintain the general independence of the community, has a decided though indirect tendency to the depression of the freemen as a class. The freeholders, who thus possessed the most valuable civil right without control of the corporate authorities, had less motive to seek admission as freemen; while the existence of an independent body of electors led, for the purpose of counteracting their influence, to the creation of non-resident freemen—a practice on the part of the corporations for the correction of which the legislature has lately interposed by one of the provisions of the Reform Act. In many corporations (we may instance those of Galway, Limerick, Cork, and Drogheda), the creation of non-resident freemen has prevailed to an extent apparently only limited by the necessity of providing a sufficient number in the interest of the corporation to bear down the resident freehold constituency. As members of the corporations for general municipal purposes, the non-resident freemen do not appear to have interfered; but such rights as they may have in that respect remain unaffected by the provisions of the Reform Act; and if the subject of contest should be of sufficient importance, they might still be resorted to by the governing body on occasion of the exercise of the corporate powers, where vested in the freemen at large.

'The admission of non-residents to such an extent seems quite inconsistent with the principles of municipal government and incorporation, and with the spirit of the charters, which are addressed to the citizens, commons, inhabitants, or commonalty of the corporate city or town, and abound in provisions for the benefit and exclusive advantages, commercial and civil, of those residing in the incorporated districts. We find the legislature itself, at a very early period, sanctioning and enforcing the principle and policy of a resident municipality, by a statute of the Irish parliament, passed in the tenth year of Henry VII. (c. 7), which enacts "that no city or great town receive or admit any person to be alderman, juror, or freeman within any of the said cities or towns, but such persons as have been prentice or have been continually inhabitant in the said cities or towns;" and (after some other provisions), "that if any city or town offend the premises or any part thereof, the mayor and commons of any such city or town, by whatever name they be incorporated by, to forfeit an hundred marks of money to the king as often as they or any of them shall offend the premises or any part of them." In practice, however, the terms of the charters and the intention of the legislature have alike been disregarded, and the provisions of the act of parliament have been considered as penal, but not prohibitory; imposing the prescribed penalty on the corporation which violates them, but not invalidating the admission of the persons in whose favour they are infringed. Election committees of the House of Commons have, in the cases of Limerick, Wexford, and Waterford, decided that the rights of election there were limited to freemen resident at the time of admission; but these decisions, which asserted a principle theretofore habitually violated in modern practice, have proceeded on evidence of the antient bye-laws and usages of these corporations, and in the case of Wexford on the special terms of the charter. In the case of Limerick, the legislature has interposed by the act for the regu-

lation of that corporation, 4 Geo. IV., c. 126; and made residence at the time of admission a necessary qualification for freedom. In Carrickfergus, also, the usage has been in conformity with this principle.

‘That the existence of such control and influence in such a body over the admission of the members is a main defect in the constitution of the municipal corporations, the results, contrasted with the objects of the institutions, appear to us to demonstrate. We apprehend the term municipal corporation may, in reference to our present inquiry, and on a view of the several charters which have come under our notice, be fairly considered to mean an incorporation of persons, inhabitants of, or connected with, a particular place or district, enabling them to conduct its local civil government. Accordingly, the regulation of the municipal district and its inhabitants, the preservation of the public peace within it by a magistracy chosen by and from the incorporated body, and the administration of justice to the community in domestic tribunals, are among the principal objects for which provision is made in the various charters of incorporation appearing to have been granted from time to time to the corporate cities and towns in Ireland. Another important object of many incorporations was the election of members to represent their respective cities and towns in parliament. A farther, and one which appears to have engaged more attention in former times than at present, was the protection and regulation of the local trade by means of commercial societies, or guilds. It appears to have been always considered conducive, if not necessary, to the attainment of the first object above noticed—that of providing for the regulation of the municipal district and its inhabitants—that the corporate body should be invested with powers to make ordinances or bye-laws for the purpose, and that such ordinances would be the more binding on the inhabitants of the district, and suited to their interests, if made with their common assent. We find, therefore, that in nearly all the charters of municipal corporations in Ireland in which the power of making bye-laws is expressly given (even in those the most restricted in other particulars), this power is vested in the whole body, including the commonalty equally with the other members. All the other objects sought by their creation alike imply that those institutions were originally designed for the peculiar and common benefit of the *residents of the corporate district*, and were intended to be identified in interest with them, and entitled to their confidence and support.

‘But the consequences of such exercise as we have described of the power of admission to the freedom of the municipal corporations in Ireland, have been to establish a very different condition of those bodies. It has followed, that in many towns there is no recognised commonalty; that in others, where existing in name, it is entirely disproportioned to the inhabitants, and consists of a very small portion, of an exclusive character, not comprising the mercantile interests, nor representing the wealth, intelligence, or respectability of the town. The corporations are, not without reason, looked on by the great body of the inhabitants of the corporate districts with suspicion and distrust, as having interests distinct from and adverse to those of the general community, whom they thus studiously exclude from a participation in the municipal government. Their members frequently consist entirely of the relatives and adherents of particular individuals or families, and the principles of their association and those which regulate admission or exclusion, have rarely any connexion with the common benefit of the district or the wishes of its inhabitants. In far the greater number of the close corporations, the persons composing them are the mere nominees of the “patron” or “proprietor” of the borough; while in those apparently more enlarged they are admitted and associated in support of some particular political interest, most frequently at variance with the majority of the resident inhabitancy.’

‘This system,’ they continue, ‘deserves peculiar notice in reference to your majesty’s Roman Catholic subjects. In one corporation alone, that of Tuam, the majority of the governing body is Roman Catholic. . . . The laws which for a series of years operated to exclude those professing the Roman Catholic religion from corporations were repealed in the year 1793 by the statute 33 Geo. III., c. 21; but the Roman Catholics have hitherto derived little practical advantage from the change. In the close boroughs they are almost universally excluded from all corporate privileges.

In the more considerable towns they have rarely been admitted even as freemen; and, with few exceptions, they are altogether excluded from the governing bodies. In some—and among these is the most important corporation in Ireland, that of Dublin—their admission is still resisted on avowed principles of sectarian distinction. Even in those corporations whose rights to freedom are acknowledged and conceded, the long operation of the penal code having prevented the acquisition of freedom by the immediate ancestors of the present Roman Catholic population, very few have been enabled, since its repeal, to establish the requisite titles. The admissions which have taken place, whether upon a claim of right or by favour, have, for the most part, been either the result of personal influence with the members of the governing body, or compliments to individuals of wealth or popularity. With the exceptions of Tuam, Galway, Wexford, and Waterford, the rule is exclusion. In Londonderry, at the passing of the Reform Act, there were only three Roman Catholic freemen. Previously to the relaxation of the penal code, the number of opulent Roman Catholics residing in the corporate cities and towns was necessarily limited. But since those changes in the laws which have enabled them to share in the general diffusion of wealth and in the benefits of unrestricted industry, they have risen and multiplied in the middle and upper classes, so that in most of the cities and towns they constitute, not only a majority of the whole population, but a large proportion of the more opulent orders. We feel bound to submit to your majesty that a system of municipal polity which excludes such a class of your majesty’s subjects from all substantial corporate privilege and power must be essentially defective in its structure. It fails to secure to the different classes of the local community participation in the regulation of their own concerns; and it operates far more widely and more mischievously than by the mere denial of equal privilege to persons possessing perfect equality of civil worth; for in places where the great mass of the population is Roman Catholic, and persons of that persuasion are, for all ancient purposes, excluded from corporate privilege, the necessary result is, that the municipal magistracy belongs entirely to the other religious persuasion; and the dispensation of local justice and the selection of juries being committed to the members of one class exclusively, it is not surprising that such administration of the laws should be regarded with distrust and suspicion by the other and more numerous body. The unpopular character of the municipal bodies is thus, in too many cases, aggravated by their being considered inimical, on the ground of sectarian feelings, to a great majority of the resident population, and they become instrumental to the continuance of the unhappy dissensions which it has so long been the policy of the legislature to allay.’

We proceed to notice the branch of our subject next in importance—the present constitution of the governing bodies of the Irish municipalities.

In some corporations the members of the legislative council are styled aldermen; in others, burgesses, or free burgesses; and in some there are two such classes, the one styled aldermen, the other burgesses. The number of each class is usually definite. In the numerous corporations created by James I. the corporate body was made to consist of a chief officer, twelve or more ‘free burgesses,’ and ‘a commonalty;’ but in the chief officer and free burgesses were exclusively vested the election of the principal officers, the filling of vacancies in the body of free burgesses, and the admission of freemen. Similar in effect, though not always with the same simplicity of form, are the constitutions of nearly all the Irish corporations; and the condition of those in which more popular principles are found affords generally but a seeming exception to the prevalent character of the governing bodies. Where a common council has been established to manage the whole or some portion of the corporate affairs, all the members of the superior classes are, with few exceptions, members of that assembly. In several corporations, representatives of the freemen at large are selected to act on their behalf in the common councils; but in few cases are they actually elected by the freemen; in most they are nominated by the superior classes of the corporation, or by the common councils themselves, without any interference whatever on the part of the general constituency. In some corporations the freemen have been altogether excluded from the governing bodies; while in the greater number of those of James I.’s creation

the 'free burgesses' have assumed the entire government, to the exclusion of the freemen altogether. The legislative constitutions of Dublin and Cork require more particular notice. The Dublin corporation is the only one in which all the members of the governing body are not elected for life. The common council consists of two bodies sitting apart; the lord mayor and board of aldermen in one chamber, the sheriffs and commons in another. The commons are composed of the 'sheriffs' peers,' being those freemen who have served the office of sheriff, whose number in the council is not to exceed 48, and of 96 members elected triennially by the various guilds of trades of which the corporation is composed: the aldermen are elected by the commons from a certain number of sheriffs' peers returned to them by the lord mayor and board of aldermen. Both sheriffs' peers and aldermen are members of the common council for life. In Cork, a more direct power is vested in the body of freemen. The acts of the common council, which consists of the mayor, recorder, sheriffs, and aldermen, and as many elected burgesses as will make up the number 24, are subject to approval by the court of freemen, in which also the election of its members is vested: but this apparent freedom of choice is in practice entirely controlled by a self-constituted association of a certain class of the freemen, of exclusive political and religious opinions.

A very remarkable feature peculiar to the legislative constitution of the Irish boroughs must here be stated. In England, non-residence has been held, in the majority of cases, to be a necessary disqualification for the legislative functions; but in Ireland, in the year 1747, the political spirit of the time induced the legislature, by statute 21 Geo. II., chap. 10, sec. 8, of the Irish parliament, to dispense with this important condition in all but a very few of the Irish corporations. After reciting that 'many of the towns corporate and boroughs not being cities, which send members to parliament, had been obliged, for want of protestant inhabitants resident in the precincts of said towns corporate and boroughs, to elect into the offices of burgesses and other offices in the said corporations persons who did not inhabit, or could not be resident, in the precincts thereof; that it had been questioned whether persons not inhabitant within said corporation could, within the letter of their respective charters, or some of them, be elected into or act as burgesses within such towns corporate or boroughs; and that it still continued impracticable in most of the said towns corporate and boroughs to find protestant inhabitants who, on account of their circumstances, were fit to be trusted in such offices,' it enacted, 'that no person who had been or should be in all other respects duly elected and admitted into any of the said offices or franchises, in any town corporate or borough not being a city, should be ousted out of any such office or franchise as aforesaid, or be any ways sued, prosecuted, or molested, for or by reason only of his not being an inhabitant of, or resident within, said town corporate or borough at the time of his election, but should hold, exercise, and enjoy such office or franchise as fully and effectually, to all intents and purposes, as if such person or persons was or were inhabitants of, or resident within, such town corporate or borough at the time of election.' The effect of this enactment was to deprive a large proportion of the corporations of a resident governing body. In some cases, a few, very rarely a majority, of the municipal council, were inhabitants of the town; while in others, the whole chartered body of burgesses became composed of non-residents, some of whom attended, *pro formâ*, at elections of the corporate officers and of the parliamentary representatives, or on occasion of the disposing of corporate property, though taking no other part in the local government.

All the evils of an irresponsible monopoly of municipal legislation so lately existing in England, are thus found in Ireland, enhanced by the several circumstances of aggravation already stated. The principle which operates to the exclusion of the great body of Roman Catholics from the corporate constituencies, universally and yet more rigorously excludes them from the close and self-elected governing councils. The control exercised over the admissions to freedom by the most important of them, that of Dublin, notwithstanding its more popular constitution, 'being directed,' say the commissioners, 'by the avowed sectarian feeling of this corporation, has practically rendered its governing body, not the representatives of the general community of the metropolis, but the head of a limited

portion of the inhabitants, comparatively few in number, and avowedly exclusive in opinion. In many corporations, too, the anomalous and injurious practice authorized by the act above quoted respecting non-residents, still continues; and the attending members, on occasion of election to corporate offices, are so few, that the validity of the corporate proceedings, and the very existence of the corporation, become subjects of doubt. In addition to so many other fertile sources of perversion, some charters gave a direct control in the corporate elections to the lord of the manor or landed proprietor of the town in which the corporation was established; while in others, the powers given to a small self-elected body become naturally centered in its most influential member. With few exceptions, the influence once acquired by persons of rank or property in the corporations was easily perpetuated by the powers of self-election in the governing councils, until by degrees the corporate bodies became, as many of them have now long been, composed almost exclusively of the family or immediate dependents and nominees of the individual recognized as the 'patron,' or 'proprietor,' acting solely according to his dictation and for his purposes, in the election of the municipal officers, the administration of the corporate affairs and property, and the returning of the members of parliament for the borough. 'We cannot reconcile with any reasonable principles of municipal government,' say the commissioners, 'the condition to which so great a number of the Irish corporations have been thus reduced, the inhabitants excluded from participation in the election of the corporate authorities, or the management of the corporate affairs, and the whole power of local government vested in a non-resident body, exercising or neglecting it as suits the wishes or convenience of their patron.' The influence thus acquired came to be regarded as absolute property, and transmitted as part of the family inheritance: in some instances it was made the subject of pecuniary purchase; in some, as in the case of Waterford, partitioned, by agreement, between contending interests; and when the legislative union between Great Britain and Ireland deprived many of the corporate towns, or rather their patrons or proprietors, of the power of returning members to parliament, this species of property was formally recognized as a subject of national compensation. The list of towns given by the Irish Commissioners, in which since that period the municipal corporations have become extinct, shows at once the purposes to which their patrons looked in preserving their nominal constitution, and its inefficiency to secure the primary objects of a municipal establishment. Many of those which were then allowed the power of returning a member to the imperial parliament, still retain a municipal corporation under the same system of patronage; which also prevails in several of the other subsisting corporations, in which the administration of property and the emoluments of office are important enough, in profit or influence, to make their retention an object of consideration.

As the endeavours of the government and legislature of the United Kingdom to assimilate the municipal system of Ireland to the reformed practice of England, have hitherto been totally defeated by the persevering opposition of the hereditary branch of that legislature, we shall here enter into no detail of the particular schemes for its amelioration proposed and carried in the representative chamber of the imperial parliament. We have only to remark the glaring anomaly exhibited in this perpetuation of the old corporation system in that very portion of the empire, and that alone, wherein municipal institutions have been perverted in the degree the most shocking to common sense, the most wounding to liberal feeling, and the most pernicious to the peace and welfare of the several communities for whose good the institutions in question were ostensibly framed. We know, indeed, that the very parties who have been mainly instrumental to this perpetuation, give up the existing system as wholly indefensible; but what are we to think of their proposal to remedy the evil by depriving so important an integral part of the kingdom of all municipal institutions whatsoever? We have here to do with the subject only so far as historical fact and political science are concerned; and in this view it is that we are called upon to point out the grave inconsistency of such as, while professing the most ardent desire to maintain the parliamentary union of the two islands, would place the English beyond St. George's Channel out of the pale of that local organization which has ever been a vital prin-

ciple of the English commonwealth, and out of which, as we have shown elsewhere, the parliamentary representation itself has chiefly risen. We say, the English beyond St. George's Channel; for they who, at this day, affect to treat the inhabitants of Ireland as aliens, seem to lose sight of one or two very important considerations. Not only did the violent introduction of the Anglican Reformation into Ireland (as we have indicated in the early part of this article) permanently substitute the division of creeds for that of races, as the grand basis of political distinctions, but since that period, also, the general progress of civilization has given the social habits, the manners, the language, and the literature of England, such universal predominance in 'the sister island,' that it is one of the grossest of fallacies to talk of the 'the Irish,' at this day, in the same sense and spirit as a good Englishman of the days of Henry II., or even of James I., might have done. A thorough identification of language and literary ideas, in particular, is surely the process of all others most importantly conducive to that perfect social amalgamation upon which political assimilation should naturally attend.

CORPULENCE. [OBESITY.]

CORPUS CHRISTI or BENE'T COLLEGE, Cambridge, was founded about the year 1351. The founders were the brethren of two guilds, termed the guilds of Corpus Christi and the Virgin Mary, by which joint name the college was originally called; but soon after its foundation it acquired the name of Bene't College (by which it is still often distinguished) from the adjoining church of St. Benedict, the advowson of which was purchased for the college of Sir John Argentine and Sir John Maltravers. Henry, duke of Lancaster, who was alderman of the above-mentioned guilds, procured from the king a charter for ratifying the endowment of the college. The number of fellowships varied originally according to the revenues of the college; it is now twelve, two of which are appropriated to the city of Norwich, and four to the county of Norfolk; the remainder are open. Archbishop Parker, when master, by his exertions in supporting the rights of the college, and improving their estates, enabled them to add two fellowships to the number then existing (which was eight), and gave certain rent-charges to the college for the purpose of founding two other fellowships and eleven scholarships. The archbishop was a great benefactor to the college also by donations of money, plate, books, and a very valuable collection of manuscripts. One of the fellowships and a scholarship were founded by Elizabeth, duchess of Norfolk, wife of Thomas Mowbray, the first duke. There are sixty-two scholarships and exhibitions belonging to this society: eleven of these were founded as before mentioned by archbishop Parker, mostly for natives of Norfolk; six by Sir Nicholas Bacon, the preference to be given to students from Redgrave school; and twelve by bishop Mawson, to be given to such students as shall excel in the annual examinations. The stipends of these scholarships and exhibitions are various. The greater part are under 20*l.* per annum. There are eleven benefices in the patronage of this college. The number of members upon the boards at the close of 1835 was two hundred and fifteen.

The valuable manuscript library left by archbishop Parker to this college is under the following particular restrictions. Every year on the 6th of August, it is to be visited by the masters or locum-tenentes of Trinity Hall and Caius College, with two scholars on archbishop Parker's foundation, and if, on examination of the library, twenty-five books are missing, or cannot be found within six months, the whole collection devolves to Caius. In that case the master or locum-tenentes of Trinity Hall and Corpus Christi College, with two scholars on the same foundation, are the visitors; and if Caius College be guilty of the like neglect, the books are to be delivered up to Trinity Hall: then the master or locum-tenentes of Caius and Corpus-Christi, with two such scholars, become the inspectors; and in case of default on the part of Trinity Hall, the whole collection reverts back to its former order. Two catalogues of this library have been published, one in 1722, and the other by the Rev. James Nasmith, 4to., Cambridge, 1777.

This college, situated in Trumpington Street, formerly consisted principally of one court, and an antient chapel built in 1578 at the expense of Sir Nicholas Bacon. The college however, being very antient, and falling rapidly into decay, was renewed in the Gothic style from the de-

signs of William Wilkins, Esq., the old court being suffered still to remain: the first stone of the new building was laid in 1823. The great west front in Trumpington Street is 222 feet in length. In the centre is an entrance gateway flanked by two towers leading into a quadrangle, 158 feet long by 129 broad, containing the chapel, library, hall, master's lodge, and forty-seven sets of apartments for the fellows and students.

Among the eminent persons educated in this college, were Hugh Latimer, bishop of Worcester, the archbishops Parker, Tennison, and Herring, Sir Nicholas Bacon, lord-keeper in the reign of queen Elizabeth, Thomas Tusser, Fletcher, the dramatic poet, Dr. John Spencer, author of the work 'De Legibus Hebræorum,' Dr. William Stukely, Robert Masters, the historian of the college, and Richard Gough, the antiquary.

The present master of this college is the Rev. John Lamb, D.D., elected in 1822. The visitors are the vice-chancellor of the university, and two senior doctors in divinity: in extraordinary cases, the king.

(Lysons' *Magna Britannia*, Cambridgesh., p. 107—109; Masters's *History of the College, with Additions*, by John Lamb, D.D., 4to., Camb. 1831; *Camb. Univ. Calendar* for 1836.)

CORPUS CHRISTI COLLEGE, Oxford, was founded in 1516, by Richard Fox, bishop of Winchester. The foundation was preceded two or three years before by the purchase of certain pieces of land in Oxford, belonging to Merton College, the nunnery of Godstow, and the priory of St. Frideswide; and the first design was to found a college for a warden and a certain number of monks and secular scholars belonging to the Priory of St. Swithin in Winchester, in the manner of Canterbury and Durham Colleges. The plan however was changed by the advice of Hugh Oldham, bishop of Exeter, who is said to have foreseen the fall of the monasteries, and whose arguments appear to have induced Fox to place his new foundation upon the general footing of the other colleges of the university. Accordingly, by license of Henry VIII., dated November 26, 1516, he obtained leave to found a college for the sciences of divinity, philosophy, and arts, for a president and thirty scholars, graduate and not graduate, more or less, according to the revenues of the society: the new college to be endowed with 350*l.* yearly. The statutes, dated February 13, 1527, show that the founder, in some degree, again changed his plan.

The society at present consists of a president, twenty fellows, twenty scholars, and two chaplains. The fellows are elected from the scholars, and the latter from the following dioceses and counties, viz. — four from the diocese of Winchester, of which two are to be of the county of Hants, and two of Surrey: two from the diocese of Bath and Wells; two from the diocese of Exeter; two from Lincolnshire; two from Gloucestershire; one from Wiltshire; two from Kent; one from Lancashire; one from Bedfordshire; one from Oxfordshire; one from the diocese of Durham; and one upon Frost's foundation. There are, besides, four exhibitioners not confined to counties.

What conferred an almost immediate superiority of reputation on this society, was the appointment in it of two lectures for Greek and Latin; a knowledge of the classics not having been considered, up to that time, as an essential branch of academic study. Ludovicus Vives, Crucher the mathematician, Thomas Lupset, Richard Pace, and other men of established reputation, were invited by the founder to his new college. Erasmus was then resident in Oxford, and assisted with his advice.

The principal benefactor to this college, in addition to the provision made by the founder, was Hugh Oldham, bishop of Exeter, already mentioned, who contributed six thousand marks besides lands. Other benefactors are enumerated in the histories of Oxford, of whom Dr. Turner, who had been president from 1688 to 1714, was one of the most liberal. Arthur Parsons, M.D., about the close of the seventeenth century, gave 3000*l.* for the purchase of advowsons. Cuthbert Ellison, who died in 1719, and lies buried in the chapel, gave 500*l.* for the same purpose, and was also a contributor to the library.

The main buildings of this college consist of the quadrangle, erected by the founder, including the hall, chapel, and library. An additional building, looking to Christ Church walks, was erected at the expense of Dr. Turner, just mentioned, in 1706. The altar-piece in the chapel is a painting

of the 'Adoration,' by Rubens, presented to the college in 1804, by the late Sir Richard Worsley; it came from the collection of the Prince of Condé, at Chantilly.

The total number of benefices in the gift of this society, is twenty-two. The number of members on the books on December 31, 1835, was one hundred and thirty. The present president is Tho. Edw. Bridges, D.D., elected in 1823. The visitor is the bishop of Winchester.

Among the eminent and learned men who received their education in this college were Jewel, bishop of Salisbury, Nicholas Udall, Richard Hooker, Daniel Featley, Dr. Richard Pococke bishop of Meath, the learned orientalist Edmund Chishull, Fiddes the biographer of Wolsey, and Anstis the herald.

(Wood's *Hist. of the Coll. and Halls of Oxf.* by Gutch; Chalmer's *Hist. of the Colleges and Halls*, 8vo. Oxf., 1810; *Oxford Univ. Calendar*, 1836.)

CORPUS JURIS CIVILIS. The term *corpus juris* (literally a body of law) was introduced in the middle ages to signify a book which comprehends several collections of law. There are two principal collections to which that appellation is given, the *Corpus Juris Civilis* and the *Corpus Juris Canonici*. [CANON LAW.] The term *Corpus Juris Civilis* designates the book in which the different parts of the legislation of the Emperor Justinian are collected, and which, being considered as one whole, contains the main body of the Civil or Roman law. According to this definition, the *Corpus Juris Civilis* consists of the compilations of the Codex, Pandects or Digests, Institutes, and Novels, which were made under the direction of the Emperor Justinian.

Justinian himself, regarding each part of his legislation as a separate collection only made for the purpose of completing former compilations, never thought of giving a common title to them all. Each part had its separate and appropriate name; for instance, the Codex was so called because it was the book in which the Roman emperors' Constitutions were collected; the Institutes were so called because they contained the first principles and rules of the law. In the middle ages, when the study of the Roman law began to flourish in the universities of Italy, the Jurists began to consider Justinian's separate collections as one entire legislation, to which a general title would be appropriate. Savigny, in his history of the Roman law in the middle ages, asserts that the term *Corpus Juris Civilis* was used in the twelfth century. However, Russardus, professor in Bourges (which, in the sixteenth century, was one of the most celebrated French universities for jurisprudence), who first edited the collections of Justinian under a common title, at Lyon, in the year 1561, chose only the term *Jus Civile* for that purpose; and Dionysius Gothofredus, likewise a French jurist of Paris, is commonly considered as the first who, in his edition in the year 1583, at Lyon, adopted the term *Corpus Juris Civilis* as a general title for the collections of Justinian. From that time this title has always been in use.

The *Corpus Juris Civilis*, as it is now composed, contains: 1. The Collections of the Emperor Justinian, viz., the Institutes, in 4 books; the Pandects or Digests, in 50 books; the Codex, in 12 books, together with the Authentica, i. e. short excerpts from the Novels, which are added to many passages of the Codex for the purpose of explaining or completing them; and the Novels, the number of which is 168. 2. An arbitrary appendix, joined to the *Corpus Juris* by different editors since the time of Russardus, viz., a. several Constitutions of the Emperor Justinian and his two successors Justinian II. and Tiberius II., called Justinian's 13 edicts, which were first received into the *Corpus Juris* by Russardus; b. several other Constitutions of the same three emperors, which were first added by Contius, in his edition of 1571; c. 114 Constitutions of the Emperor Leo, the philosopher, given by him for the purpose of amending and correcting Justinian's legislation, together with a Constitution of the Emperor Zeno, likewise first added by Contius in his edition; d. a series of Constitutions of the successors of the Emperor Justinian from the seventh to the fourteenth century, first added to the *Corpus Juris* in the edition of Charondas of 1575; e. a series of 84 (or 85 according to the older division) ecclesiastical Canons, called *Canones Sanctorum et Reverendorum Apostolorum*, first added to the *Corpus Juris* by Haloander, as to the origin of which there are different opinions, but they are probably a private collection of decrees of councils and synods before

the synod of Nicaea, A.D. 325; f. the *Libri Feudorum*, i. e., the books which contain the usages and customs of the feudal system, and which were joined to the *Corpus Juris* by the Glossators; g. and, last of all, several Constitutions of the Emperor Frederic II. In several editions we find other appendages besides those here noticed.

The manuscripts of the *Corpus Juris Civilis* are numerous, but nearly all of them contain only a part of Justinian's legislation: manuscripts which contain the whole body of law are very rare. The best MS. of the latter is at Copenhagen. Of MSS. before the time of the Glossators (professors of law, in the twelfth and thirteenth centuries, in the universities of Italy, especially in Bologna, who taught the Roman law, and explained the different parts of the *Corpus Juris*), we have only one of the Pandects, the celebrated Florentine manuscript, which was first at Pisa, but was brought in 1406 to Florence; it probably belongs to the sixth or seventh century, and some even suppose that it may be the original copy of the Pandects which was sent by Justinian to the Western Empire. The other manuscripts are of the twelfth, thirteenth, and fourteenth centuries, and contain the *versio vulgata*, or text as settled by the Glossators according to older manuscripts. In Munich and Paris there are valuable manuscripts of the *versio vulgata* of the Codex. As to the manuscripts, see Beck, *Indicis Codicum et Editionum Juris Justiniani Prodromus*, Lips., 1823. As to the manuscripts in England, there is a valuable notice in the 5th vol. of the *German Magazine of Historical Jurisprudence*.

There are numerous editions of the *Corpus Juris*: it was printed very soon after the invention of the art, but at first only separate parts were published. The oldest edition that we know of is that of the Institutes, by Peter Schœffer, in Mentz, of the year 1468. There is a copy of this edition on vellum in the King's Library, British Museum. It has a small illumination of a presumed portrait of Justinian in the title-page. The larger capital letters throughout the book are illuminated, and some of them with gold. Till the year 1476 all the parts of the *Corpus* were printed separately. The first edition, which contained the whole, is that by Honate, at Milan, of the years 1482 and 1483, but still not under a general title, which, as already mentioned, was first used by Russardus. Till the year 1518 all the editions were printed with the glosses, but after that date the glosses were commonly omitted. The last edition with glosses is of the year 1627. For a complete list of the editions, see Beck's *Index*. The best known edition of the *Corpus Juris* is that of Dionysius Gothofredus. He edited the *Corpus Juris* several times, with notes, 1583, Lyon, without notes, Lugd., 1589. His editions are often counterfeited; the best is Francfort on the Mayn, 1663.

CORPUSCULAR THEORY. [MOLECULAR THEORY.]
CORRECTING PLATE. [NAVIGATION.]
CORRECTION, HOUSES OF. [REFORMATION, HOUSES OF.]

CORRE'GGIO, ANTO'NIO ALLE'GRI, or, as he has been known to write it, **LIE'TO**, one of the first of painters, was surnamed Correggio from the place of his birth, which probably took place towards the end of the year 1493, or early in 1494. Correggio's life is involved in the most impenetrable obscurity. The only authentic records which exist are certain registered documents, public and private, which are yet preserved; but they serve only to throw a very feeble light upon his domestic life, and all our knowledge of it remains of a negative character. Some of his biographers, at the head of whom is Vasari, describe him as of humble origin, indigent, and penurious in his way of living. But the documents existing, some of which relate to the transfer of estates in his own family, and the prices paid to himself for his pictures, utterly disprove such neediness. On the other hand the attempt of Mengs and his copyist Ratti to draw his descent from a noble family of Correggio, once feudal lords of Campagnola and its castle in the Corregese, seems quite without historical foundation. The Allegri family, from which Antonio descended, appears to have been a decent family of Correggio; but the only proof of relationship between that and the other family is the coincidence of name, a most uncertain one, though it cannot be entirely overlooked. The conveyance and bequest of considerable property, such as moderately large sums of money, houses, and small portions of land, are too frequent among Antonio's immediate relations, to leave any doubt of his having been at least in easy circumstances.

Among other legacies, for instance, Pelegrino, the father of Antonio, who survived his son, left 250 gold crowns to his granddaughter, making his grandson Pomponio his residuary legatee. The fact of Correggio's making liberal use of the most expensive colours is a good collateral proof of his easy circumstances: ultra-marine, which in Ratti's time was worth from forty to fifty crowns per ounce, is unsparingly employed in his paintings. But by itself this fact would prove nothing, since the colour might possibly, as Tiraboschi observes, have been charged to those who gave him commissions.

It is quite uncertain who was Correggio's first instructor. Francesco Bianchi has been named his master; and Pungileoni, one of his most recent biographers, affirms that a certain Lombardi, who afterwards abandoned painting to practise as a physician, was his first teacher. It seems however most likely that his uncle Lorenzo first taught him the elements of his art, and that he afterwards studied under the sons of Mantegna. Mantegna himself has been supposed to be his first master; and the fact of his having died in 1506, when Correggio was barely twelve years old, does not render it impossible, although very improbable. In Mantegna's works however, we may recognise the germ of that sweet and graceful style which Correggio carried to perfection. That he ever went to Rome is far from probable, since a continued series of documents prove him to have been habitually residing in Correggio at the time when some writers have supposed he visited Rome. If he ever went at all, of which there is no better proof than surmise and tradition, it must have been for a mere visit. The mastery with which he treats classical subjects, has given rise to the supposition that he received a liberal education, and there is no proof to the contrary. It is most certain, also, that his works display a considerable knowledge of architecture; but that he practised that art, or sculpture, as some of his biographers have asserted, is entirely without proof.

Correggio was married, and had a son and three daughters. The supposition that he married a second time probably arose from a mistake in a certain register, in which his wife's Christian name is misstated; for his first wife is known to have been alive after the period assigned to his second marriage. No one ever pretended to know the surname of the second wife; but a long story was invented, showing how she was very beautiful, but of low origin, and that therefore he was ashamed of his marriage; a tale evidently framed to meet the conjecture suggested by the mistake alluded to. He died on the 5th March, 1534, and was buried in the church of St. Francis at Correggio.

It is as uncertain as anything else in his life, whether Correggio formed his more perfect style entirely from his own natural taste, with no greater model than Mantegna, or whether he had access to the works of the great painters of his time, and the antique, and received his best lessons from them. It appears probable that a mean between the two positions is the truth; that casts of the ancient sculptures, and an occasional view of some of the works of the great painters, besides copies, could be obtained in his native country; for the city of Correggio was not without a taste for the arts, and had some tolerably good painters before Correggio. At all events he formed a style completely his own, remarkable for masterly *chiaroscuro*, exquisite colouring, and the most graceful design. Less varied and decided in his outline than the painters of the Roman and Florentine schools, he is more anxious to dispose his lines in easy flowing curves than to display knowledge of anatomy or powerful drawing. Nevertheless his forms are sufficiently correct, and the consummate skill shown in his endless foreshortenings proves that his smoother style of drawing was dictated by no want of study or deficiency of ability. While Titian's colouring is bolder, more varied, and more powerful than Correggio's, it is not so full of beauty, and a certain mild and rich luxuriousness. There is the same difference between the two that there is between a bed of glowing flowers and a pulpy cluster of grapes laughing from under the vine-leaves. More studied in his use of light and shade than any of his brother painters, he gives to his pictures an air of space which mocks the limits of the frame; a depth and unity, the force of which Rembrandt alone has exceeded, and no one else approached: but the Flemish painter's sun never shines upon forms like the Italian's,—it is mostly a 'god kissing carrion.' The expression which Correggio infuses into the

lovely creatures of his pencil is in harmony with the grace of his drawing, the pure sweet colouring, and the concordant tone of the picture. Avoiding harsh and unpleasant subjects, and delighting in the play of tender and voluptuous emotions, his mothers fondle their offspring, his children frolic and smile, his lovers pant and sigh, with all the extasy of unreprieved nature. Annibal Caracci bursts out with a desire to join his infants in their sports, so real and living does he find them. If his beings are of a less mighty mould than Michel Angelo's, his colour less powerful in its tints than Titian's, and his expression less passionate than the Venetian's, and his design less perfect and less exalted than Raphael's, no artist has equalled him in gentleness and sweetness, and none calls forth the affections of the spectator in a more lively manner.

Correggio's pictures are not so numerous as those of some painters; but they are sufficiently spread over Europe for his style and fame to be universally recognised. The cupola of the cathedral at Parma is painted with an 'Assumption of the Virgin,' of which the numerous beauties, the masterly foreshortening, the grace, the colour, and the design, so excited Titian's admiration, that he is reported to have said, 'If I were not Titian, I would be Correggio.' In the gallery at Dresden are the 'Notte,' or rather dawn—a grand picture on the subject of the Nativity, and a masterpiece of *chiaroscuro*—and a little cabinet picture, the 'Penitent Magdalen,' in which the saint is represented lying on the ground reading. A blue mantle envelopes the form; the head, shoulders, bosom, and feet are bare: a shady nook enshrines the saint. Her brow rests upon one hand, and a tender melancholy trembles on her lips. The soft features, the dainty bosom, the gentle arms are of the rarest beauty. It is the most perfect woman ever painted. In the National Gallery in London are two of his best pictures, the 'Education of Cupid' (a duplicate) and an 'Ecce Homo.' The Madonna in the latter is painfully true to suffering nature, but redeemed by his usual beauty of form and expression. Two of his most celebrated pictures were destroyed, it has been said, by order of the Regent Duke of Orleans, for the too great freedom of the design—the 'Danaë' and the 'Io,'—a strange story for a man of his character. The former was pieced together again by Coypel; of the latter a duplicate still exists.

Correggio had many good pupils; among whom may be reckoned his son, who painted a fresco in the cathedral at Parma which has been much commended. He abandoned painting, however, before he died. Parmigiano may be reckoned among the followers and imitators of Correggio, though not among his pupils. The school of Bologna aimed at uniting his grace and sweetness to the drawing of the Romans and the colour of the Venetians; yet after all, Annibal Caracci, the chief of the eclectic school, seems inclined to reckon Correggio the first among painters.

It has been observed that all Correggio's pupils and immediate followers fell into affectation. This was a natural consequence of imitating a style which originated in a highly sensitive genius, constantly moved by intense and unrestrained emotions. Correggio himself has been accused of affectation; but the reproach has arisen in a cold misappreciation of his warm-hearted disposition.

(Tiraboschi; see also Mengs, Ratti, Lanzi, and *Sketches of the Lives of Correggio and Parmigiano*.)

CORREZE, an inland department of France, deriving its name from the river Corrèze, which falls into the Vézère, a tributary of the great river Dordogne. The department is of irregular form, having its greatest length from north-east to south-west seventy miles, and its greatest breadth, at right-angles to the length, forty-eight to fifty miles. Its superficial extent is about 2088 square miles: its population 294,834, or 141 to a square mile. It is bounded on the north by the department of Creuse, on the north-east by that of Puy de Dôme, on the south-east by that of Cantal, on the south by that of Lot, on the south-west by that of Dordogne, and on the north-west by that of Haute Vienne. It is comprehended between 45° 38' and 46° 26' N. lat., and 1° 10' and 2° 32' E. long. Its capital Tulle is about 250 miles in a straight line south by west of Paris, or about 292 by the road through Orléans, Limoges, and Uzerche.

This department does not contain any lofty elevations: the northern and north-western parts are traversed by the heights which run from the central group of Auvergne to the mouth of the Loire. The slope of the surface, as indicated by the water shed, is to the south-west, in which di-

rection the principal streams flow. The chief rivers are, the Dordogne, which passes by the town of Bort, and bounds the department on the south-east, until its junction with the river Auze; after which the Dordogne quits the boundary, and flows by Argental through the interior of the department, which it quits a little below the town of Beaulieu: the Vézère, which rises in the northern part of the department, and flows south-west past Treignac, Uzerche, and Alassac; its junction with the Dordogne is after it quits the department: the Corrèze, which rises not far from the source of the Vézère, and flows south-west past the towns of Corrèze, Tulle, and Brive, a little below which it falls into the Vézère. These are the principal rivers, but not one of them is navigable within the confines of the department. Of the other streams an enumeration will suffice: the Soudenne, Bradascou, and Zoure, fall successively into the Vézère on the right bank; the Montanne falls into the Corrèze on the left bank; the Chavanoux (which forms for a short distance the eastern boundary of the department), the Diège, the Trioussone, the Luzège, the Doustre, the Souvigne, and the Mounion, fall into the Dordogne on the right bank (but the junction of the latter is not within the department); the Marone and the Cère on the left: the Cère forms the boundary of the department on the south side for a short distance; its junction with the Dordogne is beyond the limits of this department. The Haute Vézère, a tributary of the Isle, one of the principal feeders of the Dordogne, has its source in this department; but the chief part of its course is beyond it. The high road from Paris by Limoges to Cahors, Montauban, and Toulouse, passes through Uzerche, Donzenac, and Brive, in the western part of this department: a road from Clermont to Périgueux and Bordeaux crosses it from north-east to south-west, intersecting the former road at Brive. There are other roads from Uzerche to Tulle, and from Argental on the Dordogne to Aurillac, in the department of Cantal: another road just passes through the south-east extremity of the department at Bort on the Dordogne. The other roads are merely cross roads (*routes départementales et vicinales*). Perhaps scarcely any other department is so wretchedly furnished with the means of intercourse and conveyance.

The soil of this department is on the whole the least fertile of any of the French departments. In the hilly districts of the north barren heaths predominate; the population is thin, and the aspect of the country wild. The lower grounds are better cultivated, but the produce in grain, chiefly barley, rye, and buck-wheat, would not suffice to maintain the population, were it not for the chestnut, which grows abundantly. A great part of the soil is occupied in pasturage, and in the spring many thousand head of cattle, which have been fattening during the winter, are sent to Paris to market. Bordeaux and Bayonne are furnished with salt pork for shipping; and walnut oil is sent into many of the departments. Some pretty good wine is produced; and horses and mules are reared. The peasantry live in a very wretched condition, as the following description quoted by Malte Brun shows:—'In his dwelling the peasant of the department (of Corrèze) is wretchedly off, and has much to complain of: his dwelling presents to view unwholesomeness, combined with dirt and misery. The greater part of the houses leaning against a moist soil, and on a level below that of the surrounding soil, are receptacles for the damp which trickles from the walls or rises from the ground. Placed without judgment, and having the apertures arranged without propriety, their houses have to sustain the cold moist winds of winter, and the concentrated and destructive heats of summer. The smoke of their fire-places, unable to escape by their ill-built chimneys, thickens in the room, and the air, charged with this irritating vapour, painfully affects the eyes: chronic ophthalmia of an obstinate character ensues, and often blindness. Add to this painful statement, that a filthy and disgusting animal, the pig, is kept close to the house, often in it, and you will have a tolerably correct idea of the situation of the peasant under his own roof.'

The department is divided into the three sub-prefectures or arrondissements, of Ussel in the north-east, population (in 1832) 57,278; Tulle in the centre, population 126,532; and Brives in the south-west, population 111,024. The towns are Tulle, the capital, on the Corrèze, population 6501 for the town, or 8689 for the whole commune; Brive or Brives, also on the Corrèze, population 5776 for the town,

or 8031 for the whole commune [BRIVE, TULLE]; Ussel, Uzerche, Beaulieu, Argental, Meymac, Donzenac, Treignac, Bort, Turenne, Alassac, Chamboulive, Lubersac, L'Arche, Corrèze, Meissac, Egletons, Neuvié, besides several smaller towns or bourgs. The department was divided at the publication of the *Dictionnaire Universel de la France*, by Prudhomme (1804), into twenty-nine cantons, or districts of a justice of peace, and 295 communes, or parishes. It is in the diocese of Tulle, and under the jurisdiction of the cour-royale of Limoges.

Ussel, the capital of a sub-prefecture, is on the rivers Sarsone and Diège above their junction. The road from Clermont to Tulle, Brive, and Périgueux, passes through this town. Some antiquities discovered by digging in a field in the neighbourhood indicate that Ussel is built on the site of an antient city, to which Malte Brun assigns Usellis as the probable name. No such place is however mentioned by D'Anville. There is a bridge over the Sarsone, distinguished by the boldness and elegance of its construction. The inhabitants amounted (1832) to 2813 for the town, or 3963 for the whole commune. They had formerly the reputation of being skilled in the manufacture of paste diamonds. The present trade consists in hides, hemp, linen cloth, and wax: some woollen stuffs are made. Granite of different kinds is found in the neighbourhood.

Uzerche is at the junction of the roads from Guéret (department of Creuse) and Tulle with the great road from Paris to Toulouse: it is seventeen miles from Tulle. It is a small antient town, and very picturesque. It is on the slope of a hill, at the foot of which flows the Vézère. The streets are not well laid out, but the houses are many of them turretted and covered with slates, attesting the importance of their original proprietors. It was a proverb formerly, that the proprietor of a house in Uzerche had his country seat in Limousin. The church, dedicated to St. Pierre (Peter), was formerly attached to a monastery established in the fifth century, to which it is likely the town owed its importance, if not its origin. The present church was built at the beginning of the fourteenth century, in place of the older one destroyed by fire. Pope Clement V., who rebuilt it, was interred here, but his tomb was destroyed by the Protestants in 1568. There were before the revolution three other parish churches. The inhabitants in 1832 were 2229 for the town, or 3214 for the whole commune. There is a glass-house at Uzerche. A few miles from Uzerche is Pompadour, the castle of which was given by Louis XV. to his mistress, the Marchioness of Pompadour.

Beaulieu is on the right bank of the river Dordogne, just above where it quits the department. This town owes its origin to a Benedictine monastery founded in the ninth century by Rodolph or Raoul de Turenne, Archbishop of Bourges. There were several religious establishments in the town before the revolution: there is at present an hospice, or almshouse. The population in 1832 was 2154 for the town, or 2415 for the whole commune.

Argental is on the Dordogne, considerably above Beaulieu. It is in the neighbourhood of coal and lead mines, and the surrounding country produces tolerable wine. The population in 1832 was 1880 for the town, or 3121 for the whole commune.

Meymac is in the hilly country, in the north of the department, near Ussel. The population in 1832 was 1850 for the town, or 3130 for the whole commune. There is coal in the neighbourhood, but we are not aware that it is worked. *Donzenac* is on the high road from Paris to Toulouse, between Uzerche and Brive. There are slate quarries near. Population in 1832, 1820 for the town, or 3219 for the whole commune. *Treignac* is in the northern part of the department, on the Vézère, in the upper part of its course. Population in 1832, 1733 for the town, 2704 for the whole commune. *Bort* on the Dordogne, in the eastern part of the department, was the birth-place of Marmontel. It is in a pleasant situation, and near it is the picturesque fall of the little river Rue, called *Le Saut de la Saule*. Population in 1832, 1705 for the town, 2291 for the whole commune. *Turenne*, a few miles south-east of Brive, has a ruined castle on the summit of a steep rock. There is a lofty tower of this castle 100 feet high yet standing, which is popularly called Cæsar's tower. Turenne has a population of 1600 persons: it was the capital of a viscounty held by the dukes of Bouillon, until it was sold to Louis XV. in 1738. *Alassac* is on the Vézère; *Chamboulive* is between Treignac and Uzerche; *Lubersac* on the

Haute (Upper) Vezère; L'Arche on the Vezère; Corrèze on the Corrèze; *Meissac* between Turenne and Beaulieu; and *Egletons* and *Neuvie* in the country between Tulle and Ussel. We have no late return of the population of these towns, but they may be taken as under 1500: the population of the communes of Alassac, Chamboulive, and Lubersac, was (in 1832) 4049, 3036, and 3502 respectively. Lubersac was the birth-place of General Souham, an officer of considerable note under Napoleon.

The department of Corrèze sends three members to the Chamber of Deputies. (Malte Brun, Balbi; Prudhomme, *Dict. Universelle de la France*.)

CORRIB, LOCH, a large lake in the county of Galway, the second in extent in Ireland, 14 feet above the sea at Galway, from which it is distant 3 miles. It is 22 miles in length, and varies from 2 to 12 in breadth. It is separated by a narrow isthmus, through which there is a subterraneous channel, from Loch Mask and Loch Carra, the first 50 and the second 64 feet above the level of the sea. The united area of these three lakes presents a surface of 64,000 acres, and has a coast-line of nearly 200 miles. They are at present navigable throughout for boats drawing four feet of water, but could easily be rendered navigable for vessels of a much larger draught. Loch Corrib alone has 40 miles of navigation, covers 30,000 acres, and has upwards of 1000 acres of excellent land on its islands. (*Report on Connaught Lakes*.)

CORRIDOR, from the Italian *coridore*, signifies a gallery or passage-way leading to apartments independent of each other. In all large buildings containing numerous apartments corridors are necessary, either closed or open. The corridor round the great cortile or open court of the Cancellaria at Rome, designed by Bramante, consists of an open gallery supported by columns.

CORRUPTION OF BLOOD. [ATTAINDER.]

CORSET, an article of dress for compressing, under the pretext of supporting, the chest and waist, worn chiefly by females, but also sometimes by effeminate individuals of the other sex. It consists of cloth made to surround the body, stiffened by whalebone or other means, and tightened by a lace. It seems a remnant of the old practice of enveloping the whole frame in swaddling bands; a practice which has been generally discarded in rearing male children, but which still lingers as a part of the attire of female children, in defiance of nature, reason, and experience. The advantages arising from its use are trifling, if any; the disadvantages manifold and serious. Nature has formed the chest (in which are lodged the lungs for respiration and the heart for circulation, two out of three of the vital functions) in the shape of a truncated cone, the base of which is capable of being alternately widened and contracted during inspiration and expiration. The wonderful and perfect mechanism for carrying on respiration cannot come into full play if any compression be applied to the lower part of the chest, which is however the part commonly selected, from yielding most easily, to endure the hurtful restraint of tight lacing. The chest never being allowed to expand to the extent which is necessary, the defect in each respiration is attempted to be compensated for by their greater frequency, and thus a hurried circulation is produced. The heart is also hindered in its action, and an imperfectly aerated blood is circulated by it, by which nutrition is inadequately accomplished: unhealthy secretions are likewise formed out of this vitiated blood, and prove a further source of disease. The muscles of the chest, spine, and abdomen, being deprived of their proper exercise, become attenuated and feeble, and incapable of giving due support, whence result distortions of the spine and chest, and much of that constipation which so frequently afflicts females. The viscera of the abdomen, especially the liver, suffer greatly, both by displacement—being forced downwards—and by being actually indented by the edges of the compressed ribs. 'In examining,' says Dr. Hodgkin, whose connexion with Guy's Hospital gives him extensive opportunities of observation, 'the bodies of the dead, I have frequently found the lower ribs of females greatly compressed and deformed. I have repeatedly seen the liver greatly misshapened by the unnatural pressure to which it had been subjected, and the diaphragm or midriff very much displaced.' The diseases which result from this interference with nature are various; and though they do not all occur in every female who adopts this mischievous practice, yet on inquiry too many may be traced to this source. Of these

diseases consumption is the most frequent and fatal. Nor is the real object of all this painful and irksome compression in any instance attained. The figure of the female bust may be altered by it, but not improved. Sculptors, who are the closest observers of nature, and who transfer to their statues every beauty presented to their eye, have invariably given ample dimensions to the lower part of the chest. The more therefore any female, not of unnatural proportions, compresses her waist, the more does she depart from resemblance to 'the statue which enchants the world.'

The accompanying figures, taken from Professor Soemmering, 'On the Effects of Stays,' will illustrate this.

(See *Penny Magazine*, vol. ii. p. 78.)

CORSICA or **CORSE**, an island in the Mediterranean, situated between the island of Sardinia and the Genoese coast. It is now incorporated with France, and forms one of the departments of that monarchy. It is of irregular form, having its greatest length in a direction very nearly north and south. The eastern coast has no remarkable indentations throughout its extent (which, following the coast line, is about 130 miles), except the small gulfs or harbours of Porto Vecchio and Santa Maria, and the étang or lake of Biguglia; but the western side of the island is indented by many deep bays, as those of St. Florent or Fiorenzo, Calvi, Porto, Sagone, Ajaccio, and Valinco. The island narrows towards its northern and southern extremities: in the north part it forms the promontory of Cape Corso beyond the towns of St. Florent and Bastia. The greatest length of the island is 116 miles; the greatest breadth about 51; and the area 3380 square miles.* There were, in 1831, 197,967 inhabitants, of whom 99,839 were males. It lies between 41° 20' and 43° 0' N. lat. and 8° 32' and 9° 33' E. long. There are round Corsica several small islands,

* According to a statement quoted by Mr. Benson (*Sketches of Corsica*, p. 159), the area of the island is 2,163,110 acres, of which 648,590 are cultivated, 601,644 capable of cultivation, and 912,876 neither cultivated nor capable of cultivation.

as Girajlia and Finocchiarolo on the north; Capraja on the north-east; l'île Rousse or Isola Rossa, Gargalo, and les Iles Sanguinaires (Bloody Islands), on the west; les Iles Cervicales and du Taureau (Bull Island) on the east; and Perduto, Cavallo, Lavessi, Santa Maria, Berettini, and Budella, in the narrow straits of Bonifacio, which separate Corsica on the south from the island of Sardinia. There are some other islands, the names of which are not given in Brué's 'Map of France,' from which we have given the above particulars.

The island is covered by a group of mountains belonging to what some geographers have entitled the Sardo-Corsican System, from its extending through both Corsica and Sardinia. The Corsican group consists of the chain of Mount Caona in the south, of the mountains of La Cagnone in the centre, those of Frontogna in the north-west, and the chain of Le Titime in the north. This line, formed by the chains of highest elevation, is nearly parallel to the line of the western coast, but at some distance inland: to the north-east and to the east of this is a second range of lower height; and the branches which extend from these ridges so nearly overspread the whole island as to leave but little country which can be called plain. Several of the peaks are very lofty, and retain the snow during the greater part of the year: the principal are Monte Rotondo, south-west of Corte and nearly in the centre of the island, 9069 feet high; Monte d'Oro, 8701 feet; Monte Paglia Orba, south-east of Calvi, 8695 feet; Punta della Capella, south-south-east of Monte Rotondo, 6723 feet; Monte de l'Incudine, south of the Punta della Capella, 6746 feet; Punta della Calva, near Punta d'Incudine, 5138 feet; Punta d'Ovace, near Sartène, 4900 feet; and Monte Stello, north-west of Bastia, 4540 feet. On the summit of Monte Rotondo is a lake, the larger diameter of which is about 1000 feet, the smaller diameter more than half that extent. On the north side of the same mountain are several small lakes, which are replenished by the melting of the surrounding snows: these lakes are always frozen.

On the sides of these mountains rise a number of streams, forming beautiful cascades, and flowing through valleys narrow, crooked, and of rapid descent: these valleys open into wider basins, in which the streams unite, and, forming rivers, flow into the sea. The rivers are the Bevinco, the Golo, the Fiumalta, the Dalesani, the Tavignano, and the Fiumorbo, on the east coast; on the west coast are the Cigno, which flows into the gulf of St. Florent or Fiorenzo; the Dostriconi, and the Regino; the Cecco and the Ficarella, which flow into the gulf of Calvi; the Sponza; the Liamone, which flows into the gulf of Sagone; the Gravone and the Prunelli, which flow into the gulf of Ajaccio; and the Talavo and the Valinco, which flow into the gulf of Valinco. None of these rivers is navigable: the longest are the Golo, about 46 miles; the Tavignano, about 43 miles; the Talavo, about 31 miles; the Valinco, about 30 miles; and the Gravone and Liamone, about 25. On the eastern coast are some salt lakes or inlets of the sea, abounding with fish, as that of Biguglia, which is nearly 8 miles long.

The mass of the Corsican mountains consists of granite, intersected by veins of serpentine, jasper, porphyry, and other stones. The granitic range extends from near the Dostriconi river to the strait of Bonifacio. To the eastward of this, extending from Cape Corso to the south-east of Corte, the mountains, which are less elevated than those of the granite range, consist of limestone, which occupies the highest part of the range, and appears to rest upon the granite; of a grey micaceous schistus, the strata of which have experienced singular contortions; and of sandstone, the strata of which are for the most part horizontal, and which seems to consist of the debris of granite. A portion of the east coast, the parts about Bonifacio in the south, and St. Fiorenzo in the north, are occupied by limestone rocks of more recent marine formation, which contain the fossil remains of shell-fish and other marine animals. In the neighbourhood of Bonifacio these deposits rest on the granite, as do the rocks of similar formation on the opposite coast of Sardinia: the islets in the strait of Bonifacio are also of granite, which seems to have occupied both the upper and lower parts of Corsica. This recent limestone is not so fine grained as that which forms the range of mountains adjacent to the great granite range. On the east coast the sea has receded; Aleria, a Roman sea-port, is half a mile from the water.

The climate of Corsica is generally described as un-

healthy. Seneca, who was exiled here, speaks of it in an epigram, as

*Corsica, terribilis quum primum incanduit aestas,
Savior ostendit quum lerus ora canis.*

Thus Englished in Boswell's 'Corsica:—

*O Corsica, whose raging heats dismay,
When first returning summer pours her ray;
Yet fiercer plagues thy scorching shores dispense
When Sirius sheds his baleful influence.*

The 'Encyclopédie Méthodique' contains a similar testimony to the insalubrity of the climate; but Boswell, whose enthusiastic admiration of every thing connected with the island has, however, diminished the value of his testimony, affirms that its insular situation renders it one of the most temperate countries in that part of Europe; that the air is 'fresh and healthful, except in one or two places, where it is moist, and where the air, especially in summer, is suffocating and sickly.' The soil is, in many places, very fertile, and capable of producing many things for which France has now to resort to distant colonies. But cultivation is very backward, and the disposition of the people indolent and careless to an unusual degree. There are large tracts of woodland in the interior, amounting to 225,000 hectares, above 560,000 acres. There are forest trees of almost every kind, especially pines, oaks, and chestnut-trees; the latter of prodigious size. The ilex or evergreen oak is common, and the mountains are covered with the arbutus or strawberry-tree. The timber which the forests yield is excellent, and would be a source of certain profit to the inhabitants, if brought down to the coast; but so great is their apathy, that the felling and transport of timber is left to the people of Lucca and Parma, who resort to the island in crowds every year, or to the agents of the French government, which procures here the finest masts for the navy. The box-tree grows to a great size. The cork oak is abundant, and the produce sent in great quantity to Marseilles. Of fruit-trees, the lemon, the orange, the fig, and the almond, are frequent; the pomegranate and the Indian fig grow to great perfection; but there are few walnut-trees, and the apples, pears, cherries, and plums are not good. The olive is found in a wild state; the industry or skill of the inhabitants not sufficing even for the simple operation of grafting. The vine is cultivated to some extent, but its culture is managed rather by the Parmesans and Luccans than by the Corsicans themselves. The wines are both red and white; that of Cape Corse resembles Malaga, that of Faviani resembles Syracuse; other wines are like Port. The mulberry was propagated by the Marquis de Marbœuf, the first governor of the island after it was ceded to France; it grows well, and it is not so much in danger from blights and thunder-storms as in Italy and the south of France; but the greater part of those propagated by M. de Marbœuf have disappeared from neglect. Wheat, rye, barley, and millet are produced, but no oats; the inhabitants feed their horses on barley instead. Chestnuts form an important article of food; and the peasants look to them, with the milk of their herds, as a sure subsistence. They resort in summer to the woods and other uncultivated lands to obtain pasturage for their cattle and chestnuts for their own subsistence at these times they make little sheds for themselves to lie under. Flax is grown in great quantity; a coarse linen is made from it. Some tobacco is raised. Much honey and wax are produced: the honey is bitter, a fact commemorated by the Roman poets.

The animals of Corsica are much the same as those of surrounding countries: there are however no wolves, and few venomous animals. The horses are small, but vigorous; they resemble the Welsh ponies or the Highland shelties. The asses and mules are also small, but active. The black cattle are larger in proportion than the horses; but the beef is lean and tough; and the quantity of milk small. Some cheese is made, but little butter; oil serving, as in Italy, for a substitute. Sheep and goats are numerous: the mutton is excellent, but the wool is coarse and hairy. Game is abundant; there is the deer, the mufoli, an animal resembling the sheep in form, but with the skin hairy, and fine-grained like that of the deer, and the wild boar, which last the Corsicans are fond of hunting; there are foxes, which are very destructive, and hares, but no rabbits. There are many kinds of birds; among them the eagle and the vulture.

The mineral productions include iron of the best quality, but the value of the iron produced in 1834 was only 36,325 francs; lead, copper, and silver are not at present worked; there is also statuary marble, jasper, porphyry, granite, including the *diorite* or orbicular granite, of which handsome vases are made, limestone for building, talc, and asbestos. The coast yields black, white, and red coral; and there is abundance of fish, especially the tunny and the sardinia. There are large beds of oysters, of which many are exported to Italy. The lakes and rivers yield fine trouts and eels. (Malte Brun; *Encyclopédie Méthodique*; Boswell, *Account of Corsica*; Benson, *Sketches of Corsica*.)

There is no manufacture in the island carried on to such an extent as to demand particular notice: some coarse woollens are woven, but finer woollens are imported; the manufacture of coarse linen has been already noticed. Neither is the commerce of Corsica extensive; the internal trade of the natives is carried on chiefly by barter: money as the medium of traffic is used only in the towns: rents are paid in produce. Indeed the capabilities of the island have not been developed; nor do the energies of the people appear to have been called forth to any extent, except in the resistance which they made to the oppressive government of the Genoese. There are good harbours at Ajaccio, Calvi, Porto Vecchio, and Bonifacio, and a small one at St. Florent or Fiorenzo. The harbour of Bastia is adapted only for small vessels; Bastia is however the busiest place in Corsica, and manufactures of soap, wax, and liqueurs are carried on. The island is wretchedly off for roads: there are only the following government roads: from Bastia to St. Florent; from Bastia across the island through Corte to Ajaccio; and from the east coast to the woodland, for the transport of timber for the navy; and these roads are of the third or lowest class. The other roads are merely bye roads; and all correspondence is conveyed by a messenger on foot guarded by soldiery.

The Corsican is frugal, but his frugality produces little other result than to reconcile him to the privations which his indolence obliges him to suffer. The peasant labours little; the listlessness of the herdsman's employment seems preferable to a calling which would render more exertion necessary; and of such labour as there is the burden is thrown upon the women. 'The Corsican wife,' says Mr. Benson, 'is little more than the slave and drudge of her haughty master. He rides on his mule while she paces along at his side. To the cultivation of the plot of ground that surrounds his hut the wife has to attend, while he smokes his pipe beneath the shady chestnut, or roams about the mountains with his gun and his dog. But with this dreadful disparity of condition between the husband and wife, the latter is seldom cruelly treated, and infidelity to the marriage contract is very rare. Children do not meet with equal attention from their parents; the sons engrossing nearly all the little property possessed by the family, whilst a daughter has nothing to look forward to in leaving the house of her father but to become the slave of her husband.' One predominant characteristic of the islanders is the spirit of jealousy and revenge which divides the inhabitants of most of the villages of the interior into hostile parties or tribes. The love of personal independence makes the Corsican prefer to be the executioner of vengeance for his own wrongs, and assassination is of frequent occurrence. Robbery is also common, the central part of the island being infested with brigands; and the freedom with which they mingle in private society testifies at once the inefficiency of the police and the low state of moral feeling in the community. Gendarmerie and troops are posted in detachments over the island, for the purpose of preventing these outrages. Against the gendarmerie the Corsican bandits wage perpetual war; yet with their lawless occupation the brigands sometimes unite a courteous demeanour, and considerable moral feeling, however partial or misdirected. Rape and false witness are common crimes among the lowest class; but the spirit of revenge pervades all classes, even the wealthy and more educated. Perhaps the state of Corsica cannot be better illustrated than by saying that, except with respect to the crimes of rape and false witness, it is similar to the state of the Highlands of Scotland a century ago. It should in justice be added that the Corsicans are anxious for instruction; the gentleman who had the direction of public instruction could traverse the isle in perfect safety. The French government, even under Napoléon, himself a Corsican, seems to have done little for

the substantial improvement of the inhabitants. Some institutions exist in the towns for the advancement of literature or science or the arts; but there is little to improve the moral condition or promote the physical comfort of the bulk of the people. The dress of the peasantry of the interior is simple: it consists, for the men, of a short jacket, breeches, and gaiters, all of chocolate-coloured cloth; a neat pointed black velvet cap, or a coarse woven cap of the same colour as the rest of their dress, with perhaps a sort of cowl which goes over the head, or is allowed to hang at the back of the neck. They generally carry a loaded musket, and have commonly a stiletto concealed about them, though this is prohibited by the French authorities. There are few peculiarities in the dress of the women: those in the neighbourhood of Ajaccio frequently wear a large round straw hat, the rest of their dress being little more than a shift reaching just below the knee: those near Bastia have the head covered with a sort of veil, like the Italian peasantry.

The villages are chiefly built on eminences: the houses are mere huts of four walls covered with a rude roof, and many of them have only one opening, serving for door, window, and chimney. Some are built of unwrought stone, and have a second story, the ascent to which is not by a staircase, but by a ladder, as in an English hay-loft. The fire, when one is lighted, is in the centre of the room. The furniture consists of stools, benches, and tables of the rudest construction. They use a pine stick for a flambeau or candle. These particulars apply only to the villages of the interior.

The religion is Roman Catholic. The fête-days of the patron saints of the villages are respectively observed with great devotion; a very imposing religious festival is observed in Rogation week in most of the villages. At the saints' festivals the Corsicans arrange the marriage of their daughters, and other family matters, and talk over the politics of the village or of the island. They are inquisitive, and readily enter into conversation with strangers, asking questions of them as to their business, and sometimes inquiring about the general politics of Europe.

The island constitutes the diocese of Ajaccio, the bishop of which is a suffragan of the archbishop of Aix, Arles, and Vienne: it is subject to the jurisdiction of a Cour Royale which sits at Bastia; but the power of the law is very imperfect. It forms the seventeenth military division, of which Bastia is the head quarters. Corsica sends two members to the Chamber of Deputies.

There are five arrondissements, or sub-prefectures. Bastia in the north and north-east, population in 1831, 60,209; Calvi, in the north-west, population, 20,441; Ajaccio, in the west, population 45,235; Corte, in the east, population 47,838; and Sartène in the south, population 24,244. The arrondissements of Ajaccio and Corte extend into the centre of the island, which is divided between them, the common boundary being the range of the granite mountains. The local revenues in 1833 were 235,571 francs, and the expences 176,637 francs.

Upon the first division of France into departments, Bastia was the capital of Corsica; and Bastia, Oletta, Ile-Rousse, or Isola Rossa, La Porta d'Ampugnani, Corté, Cervione, Ajaccio, Vico, and Tallano, were the chief places of arrondissements, or districts. Subsequently the island was divided into the two departments of Golo in the north, capital Bastia, and Calvi and Corte, capitals of arrondissements; and Liamone in the south, capital Ajaccio, and Vico and Sartène, chief places of arrondissements. Upon the reunion of these departments Ajaccio became the capital, perhaps by the favour of Napoléon, whose birth-place it was.

Ajaccio is the capital of the department, and the seat of the bishop's see: it is on the gulf of Ajaccio on the west side of the island; population in 1832, 8920 for the town, or 9531 for the whole commune. Bastia, on the north-east side of the island, is the seat of the Cour Royale, and the head quarters of the military division: population in 1832 9531. [AJACCIO. BASTIA.]

Corté, the capital of an arrondissement, and, during the short period of Corsican independence the seat of the native government and legislature, is on the road from Bastia to Ajaccio, and nearly in the centre of the island. It is partly at the foot, partly on the declivity, of a precipitous mountain, which is crowned by a castle or citadel. This rock is of green micaceous schistus, and rises in the midst of a valley which is surrounded by primitive (granite) mountains. The

Tavignano, and its tributary the Restonica, run near the town and unite a short distance below it. The citadel is strong by its position, with one winding path up to it; the streets of the town are steep, and there are but few really good houses.

During the period of independence there was a university here, established by Paoli: but it appears to be no longer in existence. It is mentioned however in the 'Dictionnaire Universel de la France,' by Prudhomme, published in 1804. We are not aware whether anything had been done in consequence of the legacies left by General Paoli for the instruction of his countrymen, and which it was intended to appropriate to the foundation of a college near Corté. The trade of Corté consists only in agricultural produce: indeed its situation in the midst of mountains and far from the coast, without any advantage or opportunity of inland navigation, preclude the extension of its commerce: though Boswell's enthusiasm led him confidently to pronounce that it would 'undoubtedly be one day a city of eminence.' The population, in 1832, was 3282.

Calvi is on a small peninsula projecting into the gulf of Calvi, which is on the north-west side of the island. It is a small town, defended by a fortress; but the harbour or road is capable of holding a considerable fleet. The population by the return previous to that of 1832 (we believe made in 1826) was 1175 for the commune.

Sartène is in the south part of the island, a few miles inland from the gulf of Valinco, and about two or three miles from the left or south bank of the river Valinco. The population in 1832 was 1715 for the town, or 2715 for the whole commune.

Bonifacio, in the arrondissement of Sartène, is on the straits of Bonifacio, which separate Corsica on the south from Sardinia. It is well fortified, and has a tolerably good harbour. The inhabitants, who amounted to 2944 in 1832, trade in wine and oil, and fish up coral.

St. Florent, or St. Fiorenzo, is in the arrondissement of Bastia, on the north-west side of the island, on the bay of St. Florent, close to the mouth of the little river Cigno. It is a handsome town with a small harbour. The population, by the return before the last, amounted to 500. The place is accounted very unhealthy. There is in the neighbourhood a lead mine, much vaunted by the Corsicans as yielding silver also, but the proportion is very small.

Porto Vecchio, in the arrondissement of Sartène, on the east side of the island, has the best harbour in Corsica, five miles long, and one and a half broad, with deep water and a good bottom. The town is rendered unhealthy by the neighbouring marshes, especially during the heats of summer. The inhabitants amounted, in 1823, to 1738; they trade in excellent wine. Granite is quarried in the neighbourhood.

Vico, a town the population of which may be probably estimated at 1000, near the gulf of Sagone, trades in wine and oil. Ile Rousse, or Isola Rossa, on the coast between Calvi and St. Florent, has a small but deep harbour. Cervione, near the east coast, has probably about 1000 inhabitants. Bastelica, near the source of the Prunella, had, in 1833, a population of 2314.

The first notice of Corsica is in Herodotus, under the name Cynus (*Κύνος*). The people of Phocæa (*Φωκαῖη*), a city in Asia Minor, unable to resist the Persian Cyrus, determined to desert their native town. In the year 544, B. C., they embarked with their wives and children, first for Chios, and afterwards for Corsica, in which they had twenty years before founded the town of Alalia (*Ἀλαλία*). Half the number, however, returned to Phocæa, but the remainder pursued their voyage and joined the people of Alalia, with whom they continued five years, plundering the surrounding nations, until having suffered dreadful loss in a sea fight against the allied fleet of the Tyrrhenians (*Τυρσηνοί*), and Carthaginians (*Καρθηδόνοι*), they abandoned Corsica to seek another settlement. (Herodot. I. 165, &c.) In the time of Gelon of Syracuse (B. C. 480) we find mention of Corsicans (*Κύρριοι*) among the troops with which the Carthaginian Hamilcar came to the aid of Terillus, tyrant of Himera (*Ἱμέρη*). (Herod. vii., 165.) The Carthaginians had probably possessed themselves of Corsica, at least of the coast, and on their downfall it came under the power of the Romans. It was ravaged by these B. C. 259, but not subdued till long after. A tribute of 200,000 lbs. of wax imposed on them

deserves notice, as indicating one of the chief products of the island at that time. The Romans founded two colonies, both on the east coast: Mariana, at the mouth of the Golo, founded by Marius, and Aleria, at the mouth of the Tavignano, by the Dictator Sylla. The Romans used the island as a place of banishment. Seneca was sent to it as an exile. On the downfall of the Roman empire Corsica came into the hands of the Vandals, and subsequently of the Goths; but the successes of Belisarius forced them to abandon the island, which was then included in the exarchate of Ravenna, a dependency of the Eastern Empire. Early in the eighth century, the Saracens, then masters of Spain, possessed themselves of Corsica; but the decline of their power and the attacks of the kings of France and Aragon, and ultimately of the Pope, led them to abandon the island, which became the subject of contention between the papal see and the maritime republics of Pisa and Genoa.

The Genoese, who at length crushed the maritime power of Pisa, and succeeded in possessing themselves of Corsica, governed it with a rod of iron for several centuries. In 1553 the French, under the Marquis de Thermes, assisted by some discontent Corsicans, and supported by a considerable Turkish fleet, attempted to conquer the island, and met at first with great success, subduing all the isle except Bastia and Calvi; but the Genoese, under the command of the veteran Andrew Doria, and supported by the emperor Charles V., at length recovered the island; and though they had by treaty granted many immunities and privileges to the natives, they soon resumed their oppressive course of government. A revolt soon took place (in 1564) under Sampiero de Bastelica or Ornano, who had instigated the French in their attempt to wrest the island from the Genoese; but he was assassinated in 1567, and the revolt quelled shortly after. The oppressions of the Genoese became after this greater and more systematic. Commercial restrictions imposed by them, checked the development of the resources of the island; while the internal commotions of the islanders themselves, which led to continual assassinations, prevented their uniting for the common good: the legal authorities converted these assassinations and disturbances into grounds for confiscation, or exacted large sums as the price of the offender's escape. In 1676 the Genoese settled here a colony of Mainote Greeks, who had fled from the oppressions of their Turkish conquerors: their descendants still continue at or near Ajaccio. Between these settlers and the natives great jealousies and feuds arose; and when the island at last revolted, the Genoese found in these Greeks their staunchest supporters.

In 1729 the long-smothered discontent broke out. A tax collector seized some of the goods of a poor woman of the village of Bozzo, near Corte, for the amount of taxes due from her, amounting to about five-pence English. The remonstrances of the neighbours drew forth threats from the collector, and they, irritated by his conduct, drove him away with stones. The Genoese sent troops to quell the commotion, and the natives assembled to repel them: the revolt became general, and the natives placing at their head three of their countrymen, Andrew Ceccaldi, a noble, Luigi Giafferi, a man of less elevated origin but large family connexion, and Domenico Raffaeli, an ecclesiastic, possessed themselves of the town of Bastia, though they failed in their attempt on the castle. The Genoese tried at first to subdue the revolvers by their own forces alone, but finding these insufficient, applied to the emperor Charles VI., who sent first in 1731 a small body of forces, which proved inadequate, and then a large army under the Prince of Wirtemberg (A.D. 1732), which compelled the islanders to submit upon terms, the observance of which the emperor guaranteed. The three chiefs, with another Corsican of note, went to Genoa as hostages, and the Genoese would have put them to death with the emperor's consent, but for the interference of the Prince of Wirtemberg and Prince Eugene of Savoy. The Genoese violated the terms, and in 1734 the revolt broke out anew: the Corsicans chose for their leaders Giafferi, the only one of their three chiefs who had returned to the island, and Giacinto Paoli.

In the year 1736 there came a vessel under the English flag from Tunis, laden with artillery and warlike stores, clothing, and money, and bringing a person of noble exterior, richly dressed in the Turkish fashion, who landed for the assistance of the islanders, claimed to be a grandee of various countries, and made the most magnificent

promises of foreign aid.* This was Theodore, by descent Baron of Neuhoef in Westphalia, but by birth a Frenchman, who, after a life of romantic adventure, aspired to become king of Corsica, and had secretly negotiated with some of the chiefs for the purpose. The Corsicans, struck with his personal appearance, dazzled by his promises, and looking upon his opportune arrival as little less than miraculous, willingly chose him as their king. He exercised the regal power for some months, coined money, distributed patents of nobility, instituted an order of knighthood, and, to evince his firmness, put to death three persons, members of distinguished families. He undertook many enterprises against the towns still held by the Genoese, took Porto Vecchio, but failed before Bastia. Before long however, through the failure of his promises, his popularity diminished, and he determined to leave the island, to solicit, as he said, the succours of which he had been disappointed. He arranged for conducting the government during his absence, quitted Corsica, and visited successively Italy, France, and Holland. Being arrested for debt at Amsterdam, he was released by a Jew and his associates, who furnished him with funds to fit out three merchant vessels and a frigate, with which he appeared off the island in 1738: but the Genoese had by this time called in the aid of the French, who had under M. de Boisseux made great progress in putting down the insurgents; and Theodore was afraid to land, though he put on shore some warlike stores. The next year the French, under the Marquis de Maillebois, a man of great promptitude and severity, forced the insurgents to lay down their arms. Theodore again appeared off the island in 1742; but the natives did not show any inclination to receive him. He afterwards went to London, where he was imprisoned for debt, but obtained his release through the kind interference of Horace Walpole, and made over his kingdom of Corsica as a security to his creditors. He died in London in 1756, and is buried in St. Ann's Churchyard, Westminster, where his epitaph records the strange vicissitudes of his life. Giafferi and Paoli went to Naples, in the service of which kingdom they continued till they died.

Upon the departure of the French, A.D. 1742, the revolt broke out again, Gaffori and Matra being the leaders of the Corsicans. In the year 1745 a British fleet gave assistance to the Corsicans, and by bombarding Bastia and St. Fiorenzo, obliged the Genoese in those towns to surrender. But the dissensions among the islanders, which resulted from the jealousy of Matra and Gaffori at the appointment of Count Rivarola to be generalissimo, disgusted the British, who withdrew, and the Genoese soon after recovered Bastia and St. Fiorenzo. The jealousy subsided, and the three chiefs shared the government between them, until the departure of Rivaroli on a foreign mission, on which he died in 1748, and the entrance of Matra into the Piedmontese service, left the sole power to Gaffori. Gaffori was assassinated in 1753, as was supposed by the contrivance of the Genoese: and the island continued for two years without a chief, until the appointment in 1755 of Pasquale or Pascal Paoli, son of Giacinto Paoli already mentioned, to the office of General of Corsica. Paoli defeated the Genoese and those of his countrymen who opposed him, settled the government of Corsica, and provided for the improvement of his countrymen. The cessation of those internal discords among the Corsicans, which had enabled the Genoese to maintain their footing in the island, alarmed the latter, who again implored the aid of France, which being in debt to the republic of Genoa, furnished auxiliary troops by way of payment. In 1764 the auxiliaries arrived, and were put in garrison in Bastia, Calvi, Ajaccio, St. Fiorenzo, and Algagliola, near Calvi. Their instructions were to secure these points without undertaking offensive operations against the natives. From the attack of these therefore the Corsicans prudently abstained, and directed their efforts elsewhere. One of our authorities indeed (*L'Art de vérifier les Dates*, tom. xviii., p. 38), speaks of an unsuccessful attack on Bastia, made by Paoli in 1765.

In the year 1768 Genoa ceded the island to France, reserving only the right to reclaim it upon payment to the French government of the expenses they had incurred or might incur in the subjugation of it. This cession quite changed the face of affairs. A large French army was employed in active operations under the Marquis de Chauvelin, the Count de Marbœuf, and the Count de Vaux. The natives fought desperately; but they had not adequate means of resistance. Corté, which they had made their capital,

was taken without resistance; and Paoli, retiring with a reduced force, was beset by a body of the enemy too powerful to be resisted. He addressed his adherents in a pathetic speech, and embarking in an English vessel at Porto Vecchio, passed over to Leghorn in 1769, and afterwards went to England, where he resided many years. The islanders continued to struggle for a time, but it was in vain: France obtained full possession.

The French Revolution revived the hopes of the Corsican patriots, and Paoli went over to Paris to thank the Constituent Assembly for having admitted Corsica to the benefit of the French laws, and recalled those who had been exiled for having sustained its independence. He was appointed military commander in Corsica; but having observed with alarm a proposition made in the French legislature to cede Corsica to the Duke of Placentia, and lamenting the course which the Revolution subsequently took, having been accused also of treason to the French government, he put himself at the head of a party of malcontents, by whom he was elected generalissimo and president of an assembly held at Corté. He now sought the aid of the English admiral Lord Hood, who commanded the Mediterranean fleet; and after some negotiations and warlike operations on a small scale, General Dundas landed on the island A.D. 1794, with five regiments. The French troops evacuated St. Fiorenzo, and shortly after Bastia surrendered with a garrison of 4000 men. Calvi also surrendered; and by negotiation between the British government and the Corsicans, the island became part of the British empire. A constitution was drawn up by an assembly of the nation at Corte, and agreed to by Sir Gilbert Eliot (afterwards Lord Minto), as viceroy of the king of Great Britain. But though it is said that the mass of the people were favourable to these proceedings, the French had still a strong party, and this was increased by disgusts which arose between the Corsicans and the English functionaries. Various incidents, trivial in themselves, increased the alienation; and the English government, jealous of Paoli's well-earned influence over his countrymen, directed him to leave the island and proceed to England. Upon his departure things assumed a more serious aspect, and the English at last determined on abandoning Corsica, which they did in 1796. The French soon repossessed themselves of it, and exiled the leaders of the revolt. ce this time Corsica has been united to France.

Bonaparte never showed much favour to Corsica: he was not popular there, nor is his memory cherished. On his downfall, owing to the oppression of the military commandant discontents broke out in Corsica, and a small British force landed on the island at the invitation of the islanders; but they held the posts which they occupied merely for the purpose of transferring them to the restored government of the Bourbons.

CORTE'. [CORSIKA.]

CORTES, HERNAN, was born in 1485 at Medellin, a village of Estremadura, in Spain. He was sent to study law at Salamanca; but being of a turbulent and dissipated disposition, his father wished him to go to Italy as a military adventurer under the Great Captain. Not succeeding in this, in 1502 he obtained permission to follow his kinsman Ovando, who was appointed governor of Hispaniola; but an accident which befell him in scaling a lady's window prevented his joining Ovando till 1504. In 1511 he distinguished himself under Velasquez in the conquest of Cuba, and in 1518 was selected by this governor to undertake the conquest of Mexico, then just discovered by Grijalva. Accordingly, Cortes set sail from St. Jago de Cuba the 18th of November, 1518, with ten vessels, ten pieces of cannon, eighteen horsemen, 600 infantry, thirteen only of whom were musketeers, and the rest cross-bowmen. He touched at various places, and among them at Havannah in search of more adventurers; and setting out again February 10th, 1519, bent his course to Cozumel, left this island on the 4th of March, and proceeded up the river Grijalva, or Tabasco. Velasquez, soon after he had dispatched his lieutenant with the brilliant prospects of conquest, revoked his commission, and attempted to get him brought back under arrest; but the vigilance of Cortes frustrated all the schemes of the governor.

Having taken the town of Tabasco, with much slaughter, he received from its cacique gold and provisions, and twenty female slaves. One of these, who makes a great figure in the history of the conquest, under the name of Doña Marina, being a native of Mexico, became highly useful as inter-

preter, in conjunction with Jerome de Aguilar, who had been eight years prisoner in the island of Cozumel. Advancing into the interior, Cortes met at San Juan de Ulua some Mexican chiefs, who were anxious to know his intentions. Cortes laid great stress upon the importance of his mission from the great monarch of the east, and the necessity of his waiting upon their king. Native painters in the mean time were delineating on cotton cloth the ships, horses, artillery, &c. of the ominous visitors, in order to acquaint their sovereign with the wonders which words could not describe. To awe them still more, Cortes displayed the evolutions of his men and horses, and the havoc made on trees by the terrific thunder and discharge of cannon-balls. Several of the terrified Indians fell to the ground, and so many ran away, that it was difficult to subdue their alarm and regain their confidence.

During the negotiations for his progress to the capital, Cortes founded the colony of *Villa Rica de Vera Cruz*, and defeated the faction of the partizans of Velasquez, who, in the midst of the expedition, were in full readiness to revolt. Not satisfied with this, to prevent all farther hesitation and division among his followers, by leaving them no other chance of safety than in union and the conquest of a hostile country in which he shut them up with himself, he deliberately broke his ships to pieces. Cortés, moreover, gained over the caciques who were impatient of the Mexican yoke. The cacique of Zempoalla implored his assistance, and furnished him with provisions and 200 Indians to carry burdens, an invaluable service in a country where beasts of burden were unknown. On arriving at the confines of the Tlascalans, Cortes was attacked by them, under suspicion of his seeking the friendship of the Mexicans, their implacable enemies; but after an incredible slaughter, 6000 of them joined the conquerors. With this reinforcement Cortes reached the territory of the Cholulans, who, being the antient enemies of his new auxiliaries, refused to admit them into their holy city of Cholula. However, in obedience to Montezuma's injunction, they received the Spaniards, but at the same time formed a plot against them. Cortes, anticipating their treachery, destroyed 6000 of them without the loss of a single soldier. The perplexity of the Mexican councils increased with the boldness of the invaders, who were now regarded as those descendants of the sun, destined by prophetic tradition to come from the east, and subvert the Aztec empire. Accordingly, on the 8th of November, 1519, they were received at Tenochtitlan, the Mexican capital, as *Teules*, or divinities. Soon after, however, an attack was made by the natives, acting under secret orders, upon Vera Cruz, and the head of a prisoner was carried in triumph through the country up to the court, to disprove the immortality of the Spaniards. Cortes, on learning this treachery, carried off the emperor Mutezuma, or Montezuma, to his quarters, although he asserted his innocence, and offered to deliver up the chief aggressor. But Cortes demanding also the son of this officer and five officers more, had them all burnt alive in front of the imperial palace, on a pile made of the weapons which were kept in store for the defence of the state. During the execution, the emperor was loaded with irons. Subsequently he acknowledged Charles V. as his lord, but he constantly refused to embrace Christianity; and when Cortes led his soldiers to stop the human sacrifices and throw down the idols in the grand temple, both priests and people rose in arms and forced him to desist. After this provocation, the Mexicans became resolved to expel the Spaniards, and Montezuma, though a prisoner, assumed the tone of a sovereign, and ordered Cortes to depart.

After six months' occupation of Mexico, when the danger of the Spaniards had increased, 18 ships with 80 horsemen, 800 infantry, 120 cross-bowmen, and 12 pieces of artillery, were sent under Pamphilo de Narvaez by Velasquez against Cortes. Cortes, deriving fresh courage from his disappointment and indignation, persuaded Montezuma that he was going to meet his friends. Leaving him and the capital in charge of Pedro de Alvarado, with only 150 men, he marched with 250 against Narvaez, attacked him in the dead of night near Zempoalla, made him prisoner, and with the new army hastened back to Mexico, which had revolted in his absence. Although he resumed his former position there, he had soon to maintain a desperate conflict, and to retreat for safety after Montezuma had perished in attempting to appease his subjects. This success of the Mexicans led to their total defeat in the battle which they fought and lost in the plain of Otompan or Otumba, July 7th,

1520. This victory enabled Cortes to subdue some of the neighbouring territories with the assistance of the Tlascalans, to attach 10,000 more of them to his service, to attack Mexico again six months after his retreat, and to retake it the 13th of August, 1521, after seventy-five days of fierce and almost daily fighting. The natives once more reduced to despair rose again, and again they yielded to superior discipline, though on no occasion did native Americans so bravely oppose European troops. Thus a daring adventurer, regarded and treated by his countrymen as a rebel, after a bloody struggle, gained possession of a country which for more than three centuries formed one of the brightest gems in the Castilian crown. The atrocities of Cortes have been the subject of much declamation, but he was a soldier by profession, and while the Inquisition burnt Jews and Protestants in Spain, he could learn from his chaplains no other or better means of converting heathens than by fire and the sword.

Indignant at the ingratitude of Charles V., who listened to his enemies, Cortes returned to Spain in 1528 to face his accusers. He was received with much respect, and made Marquis of the rich valle de Oajaca, but in 1530 had to return to Mexico divested of civil power.

Being anxious, after his military exploits, to extend his fame by maritime discovery, particularly in the opening of a passage from the Atlantic to the Pacific, he fitted out at his own expense different expeditions, one of which discovered California in 1535, and he himself coasted next year both sides of the gulf of that name, then called the Sea of Cortes. He returned to Spain in 1540, when he was received by Charles V. with cold civility, and by his ministers with insolent neglect. He accompanied however this prince in 1541 as a volunteer in the disastrous expedition to Algiers, and his advice, had it been listened to, would have saved the Spanish arms from disgrace, and delivered Europe three centuries earlier from maritime barbarians. Envied and ill requited by the court, Cortes withdrew from it, leaving sycophants and detractors to reap the fruits of his labours and his genius. He died however in affluence near Seville, the 2nd of December, 1547, in the 63rd year of his age. The destruction of his fleet at Vera Cruz, with the object of compelling his followers to conquer or die—his fearless entry into Mexico—the still bolder seizure of Montezuma in his own palace—his defeat of Narvaez—his victory of Otumba—and his magnanimity in the siege of Mexico, are deeds almost unparalleled, and more like romance than reality.

Robertson has estimated the character of Cortes at least as highly as his own countrymen Bernal Diaz del Castillo, Gomara, Herrera, Solis, Lorenzana (who published, in 1770, a History of New Spain, founded on the only writings of Cortes, which consist of four letters to Charles V.), and Trueba.

CORTES, the name of the assembly of representatives of the Spanish nation. These assemblies have been variously constituted in different ages, and in the different kingdoms into which Spain was divided till the time of Ferdinand and Isabella. The cortes of Castile and Leon and those of Aragon were the principal. Considerable obscurity prevails as to the origin and the formation of both. The earliest national assemblies under the Visigothic kings met generally at Toledo; they consisted chiefly of the dignitaries of the church, and were called councils. After deciding all questions of church discipline, they concerned themselves with temporal affairs, and in this stage of the discussion the lay lords or barons took an active part, and the king presented his requests. In the acts of the council of Leon, A.D. 1020, ch. vi., the transition from ecclesiastical to temporal affairs is clearly pointed out:—'Judicato ergo ecclesiæ judicio, adeptaque justitia, agatur causa regia, deinde populorum.' In the acts of the council of Jaca, 1063, we find that several points of discipline were reformed 'with the consent of the nobles and prelates;' and the signatures are those of the king, the infantes, nine bishops, three abbots, and three magnates; but it is added in a note that 'all the other magnates had subscribed to the same acts.' It is now generally acknowledged, that in that age, and down to the end of the twelfth century, there was no popular representation from the towns or commons of Castile and Leon in those assemblies. (Marina, *Teoria de las Cortes*; Sempere, *Histoire des Cortes*; Dunham, *History of Spain and Portugal*.) The people are said to have occasionally attended these national councils on some solemn occasions, as in the council held at Toledo in 1135, but only

as spectators and witnesses, 'to see, to hear, and to praise God.' By degrees, as the towns rose into importance, and obtained local fueros, or charters, from the kings for their own security, or formed themselves into fraternities for their mutual protection against the Moors or against the violence of their own nobles, some of them obtained at last the privilege of sending deputies to the national councils, which were now styled cortes, because, according to some etymologists, they were held at the place where the king had his court. The cortes held at Salamanca by Ferdinand II., in 1178, consisted only of the nobility and clergy; but at the cortes of Leon, A.D. 1188, we first hear that there were present deputies 'of towns chosen by lot;' and in the same year the cortes of Castile assembled at Burgos, where deputies from about fifty towns or villages, the names of which are mentioned, were present. How these places came to obtain this privilege is not known, although it is probable that it was by the king's writ or by charter. The cortes were henceforth composed of three estamentos or states, clergy, lords, and procuradores, or deputies from the enfranchised towns, forming together one chamber, but voting as separate states. It was a standing rule that general laws must have in their favour the majority of each estamento. This was the principle of the cortes of the united kingdom of Castile and Leon. The same principle existed in the kingdom of Aragon; only there the cortes were composed of four brazos or states, namely, the prelates, including the commanders of the military orders, the ricos hombres, or barons, the infanzones, or caballeros, who held their estates of the great barons, and lastly, the universidades, or deputies of the royal towns. These last are first mentioned at the cortes of Monzon, in 1131. The towns and boroughs in Aragon which returned deputies were thirty-one; but the number of deputies returned by each is not defined by the historians, any more than those for the cortes of Castile. We find the same town returning sometimes a greater, sometimes a smaller number, and at other times none at all, and a small town or village sending more deputies than a large one; while many considerable towns never returned any, independently of the seignorial towns, which of course had no representative privilege. How all this was made to agree with the manner of voting, in order to ascertain the opinion of the majority, is not clearly stated. Under the head ARAGON the reader will find an account of the peculiar institutions of that kingdom, which have been much extolled by some writers, and which appear to have been better defined than those of Castile, as the Aragonese, with the exception of the peasant serfs of the nobility, certainly enjoyed a greater share of individual liberty than the rest of the Peninsula.

In Castile, from the end of the thirteenth century, the popular estamento made rapid strides towards increasing its influence, being favoured in this by some kings or pretenders to the crown, such as Sancho IV. and Enrique II., or taking advantage of disputed successions and stormy minorities, to obtain from one of the contending parties an extension of their privileges. In 1295 the deputies of thirty-two towns and boroughs of Castile and Leon assembled at Valladolid, and entered into a confederacy to defend their mutual rights against both the crown and the nobles. Among many other resolutions, one was, that each of the thirty-two constituencies should send two deputies every two years to meet about Pentecost at Leon or some other place, in order to enforce the observance of their stipulations. In 1315, during the frightful confusion which attended the minority of Alonso XI., we find another confederacy between the nobles and the procuradores of 100 communities, with a similar clause as to deputies meeting once or twice every year. These meetings of deputies for special purposes ought not to be confounded with the general cortes of the kingdom, which were always convoked by the king, though at no fixed times. Enrique II. having revolted against his brother Pedro the Cruel, courted the support of the municipal towns, which at the cortes of 1367 demanded the admission de jure of twelve deputies into the royal council, which had till then consisted of hereditary nobles and prelates, with occasionally some civilian called in by the king. Enrique promised to comply with their request; but his brother's death having insured his seat on the throne, he evaded the fulfilment of his promise by creating an Audiencia real, or high court of appeal, consisting of prelates and civilians, and a criminal court of eight alcaldes, chosen from different provinces of the kingdom. Juan I., who succeeded him, after the loss of the

battle of Aljubarrota, created a new council in 1385, consisting of four bishops, four nobles, and four citizens, with extensive executive powers. The towns next solicited the dismissal of the bishops and nobles from the council, in order that it should consist entirely of citizens; but Juan rejected the demand. They also contrived at times to exclude the privileged orders from the cortes. Marina says that the privileged orders themselves having lost much of their influence, abstained from attending the cortes; yet it is certain that although money might be voted without them, for the simple reason that they were exempt from taxation, the third estate alone paying all direct taxes, yet nothing else of importance could be decided without their concurrence. Although members of the privileged orders should not attend, they might be represented by proxy, as was the case in Aragon. Besides, the cortes were not all of one sort; there were general or solemn cortes, and especial cortes for some particular purpose. Juan appointed by his testament six prelates and nobles as guardians of his infant son Enrique III., who were not, however, to decide in any important affair without the concurrence of six deputies, one from each of the cities of Burgos, Toledo, Leon, Seville, Cordova, and Murcia. 'The fourteenth century seems to have been the brightest period of popular or more properly municipal representation in Spain. The cortes were frequent, and the subject of their deliberations of the most important nature. But Spain had never a definite representation; to no meeting of this period did all or half the great towns send deputies; and those which did return them appear to have observed little proportion in the numbers. There can be no doubt that two should be returned from each; yet in the cortes of Madrid, in 1390, we find that Burgos and Salamanca sent eight each, while the more important cities of Seville and Cordova sent only three; Cadiz only two; Oviedo and Badajoz one; Santiago, Orense, Mondonedo, and other great cities of Galicia sent none at all. In fact, only forty-eight places returned deputies to these cortes, and the number, at the most, was inconsiderable. Incidentally, we learn that in the assemblies of this period the archbishop of Toledo spoke for the ecclesiastical state, and the chief of the house of Lara for the nobles. Some of the deputies contended for the precedence in voting, as well as for that of seats. This rivalry was more conspicuous between Burgos and Toledo, until Alonso XI. found the means to appease it. "The deputies of Toledo," said the monarch in the midst of the assembly, "will do whatever I order them, and in their name, I say, let those of Burgos speak." The municipal corporations could boast of something more than the honour of returning deputies, an honour to which many of them were perfectly indifferent. Their condition was far superior to that of the seignorial towns, which, for the most part, groaned under the oppressions of the nobles.' (Dunham, *History of Spain and Portugal*, b. iii. sect. 3, ch. ii.)

The remonstrances or petitions of the general cortes to the king generally began as follows:—'The prelates, lords, and caballeros of the kingdoms of Castile and Leon, in the name of the three estates of the kingdom,' &c. Remonstrances from the deputies of the towns began:—'Most high and powerful prince! your very humble vassals, subjects, and servants, the deputies of the towns and boroughs of your kingdoms, who are assembled in your presence by your order,' &c. (Cortes of Valladolid, June, 1420.)

In the cortes of 1402, Enrique III. demanded for his wars with the Moors a supply of 60,000,000 of maravedis, but the deputies granted only 45,000,000. The king then proposed that if the money should be found insufficient, he might be allowed to raise the deficiency by a loan without convoking the cortes afresh for the purpose. To this the majority of the deputies assented. By his testament Enrique excluded the citizens from the Council of Regency during the minority of his son Juan II., and after this they were no longer admitted into the royal council. Thus the municipal towns lost a great advantage they had gained 30 years before under Juan I. They soon after sacrificed, of their own accord, their elective franchises. The expenses of the deputies to the cortes had been till then defrayed by the towns, but now having lost their influence at court by their exclusion from the royal council, the towns began to complain of the burthen. Juan II. listened attentively to their complaints, and, in the cortes of Ocaña, 1422, he proposed that the future expenses of the deputies should be defrayed out of the royal treasury, a proposal which was willingly

accepted. Accordingly, in the next cortes, 12 cities only, Burgos, Toledo, Leon, Zamora, Seville, Cordova, Murcia, Jaen, Segovia, Avila, Salamanca, and Cuenca, were summoned to send their deputation; some other towns were informed that they might entrust their powers to any deputy from the above. The privilege was subsequently extended to six more cities: Valladolid, Toro, Soria, Madrid, Guadalajara, and Granada. These 18 places constituted henceforth the whole representation of the kingdoms of Castile, Leon, Galicia, and Andalusia. The other communities at last perceiving the advantage they had lost, petitioned to be restored to their right, but found themselves strenuously opposed by the 18 privileged towns. The influence of the court was openly exercised in the elections of these towns, and although the cortes of Valladolid in 1442, and those of Cordova in 1445, requested the king to abstain from such interference, yet the practice became more barefaced than ever. In 1457 Enrique IV. wrote to the municipal council of Seville, pointing out two individuals fit to be deputies in the next session, and requesting they might be elected. The municipal councils, which elected their own officers as well as the deputies to the cortes, were composed of all the heads of families, but by degrees the crown interfered in the appointment of the municipal officers. [AYUNTAMIENTO.]

Thus long before Charles I. (the emperor Charles V.), who has been generally accused of having destroyed the liberties of Spain, the popular branch of the representation was already reduced to a shadow, for the deputies of the 18 cities, elected by court influence, were mere registrars of the royal decrees, and ready voters of the supplies demanded of them. Under Ferdinand and Isabella the royal authority became more extended and firmly established by the subjection of the privileged orders; the turbulent nobles were attacked in their castles, which were razed by hundreds, and the Santa Hermandad hunted the proprietors throughout the country. Many of the grants by former kings were revoked and the proud feudatories were tamed into submissive courtiers.

Charles only finished the work by excluding the privileged orders from the cortes altogether, he and his successors contenting themselves with convoking the deputies of the 18 royal cities of the crown of Castile on certain solemn occasions, to register their decrees, to acknowledge the prince of Asturias as heir apparent to the throne, to swear allegiance to a new sovereign, &c. The policy of absolutism has been the same in all countries of Europe, using the popular power against the aristocracy, in order to reduce and destroy both in the end.

In Aragon, Valencia, and Catalonia, which formed the dominions of the crown of Aragon, the cortes of each of these three states continued to assemble under Charles I. and his successors of the Austrian dynasty, who convoked them in their accustomed manner by brazos or orders, and they maintained some show of independence, although in reality much reduced in importance, after Philip II. had abolished the office of the Justiza. [ARAGON.] But, after the War of the Succession, Philip V. of Bourbon formally abolished the cortes of these states by right of conquest, as he expressed it, because they had taken part with his rival the Archduke Charles.

When, in 1808, the Spanish people rose in every province against the invasion of Napoleon, the king was a prisoner in France after having been obliged by threats to abdicate the crown, and the nation found itself without a government. Municipal juntas were formed in every province, consisting of deputies taken from the various orders or classes of society, nobles, clergymen, proprietors, merchants, &c. These juntas sent deputies to form a central junta, with executive powers for the general affairs of the country, but a legislature was still wanting. The central junta was called upon to assemble the cortes for all Spain. They at first thought of reviving the ancient cortes by estamentos or brazos, but many difficulties presented themselves. The difference of formation between the old cortes of Aragon and those of Castile; the difficulty of applying those forms to the American possessions of Spain, which were now, for the first time, admitted to equal rights with the mother country, but where the same elements of society did not exist, at least not in the same proportion; the difficulty even in Spain of collecting a legitimate representation of the various orders, while most of the provinces were occupied or overrun by French armies, and while many of the nobility and the higher clergy had acknowledged the intrusive

king Joseph Napoleon; all these, added to the altered state of public opinion, to the long discontinuance of the old cortes by orders or states, to the diminished influence of the old nobility, and the creation of a new nobility during the latter reigns merely through court favour, made the original plan appear impracticable. The situation of the country was in fact without a parallel in history. The central junta consulted the consejo (reunido) or commission of magistrates, from the old higher courts of the monarchy, who proposed to assemble deputies of the various brazos or estamentos, all to form one house, a proposal extremely vague and apparently impracticable, which looks as if made to elude the question. Jovellanos and others then proposed two houses, constituted as in England; but this would also have been a new creation without precedent in Spain, and surrounded by many difficulties, the state of society being greatly different in the two countries. Meantime the central junta being driven away by the French, first from Madrid, and afterwards from Seville in January, 1810, took refuge at Cadiz, which became the capital of the Spanish patriots, whither a number of persons from the various provinces and classes had flocked. Before leaving Seville, the central junta issued regulations addressed to the provincial juntas about the manner of electing the deputies to the cortes, stating at the end that 'similar letters of convocation would be addressed to the representatives of the ecclesiastical brazo and of the nobility.' This, however, was never done.

The central junta soon after arriving at Cadiz resigned its powers into the hands of a council of regency composed of five individuals, but before its resignation it issued a decree approving of the plan of Jovellanos for two chambers, and recommending it to the regency. The regency however paid little attention to this recommendation; it seemed to hesitate during several months about convoking any cortes at all, for there was at Cadiz a party of pure absolutists opposed to any representation whatever. The regency again consulted the consejo reunido, the majority of which, departing from its former opinion, gave up the idea of cortes by estamentos, and proposed the election of deputies without distinction of classes. The council of state being likewise consulted by the regency, decided that, owing to the actual state of affairs, it was best to elect the deputies without estamentos, reserving to the 'representatives of the nation once assembled to decide whether the cortes should be divided by brazos or into two chambers, after listening to the claims of the nobility and clergy.' The regency at length issued letters of convocation for the deputies of all the provinces to assemble in cortes at the Isla de Leon on the 24th September, 1810. The elections for those provinces which were entirely occupied by the French, were made at Cadiz by electoral juntas, composed of individuals of those provinces who had taken refuge there. A similar process was adopted with regard to the American provinces. (Arguelles, *Examen historico de la Reforma Constitucional*; Jovellanos, *Memoria a sus Compatriotas*, with appendix and notes to the same.)

The cortes, styled 'extraordinary,' sat at Cadiz from September, 1810, till September, 1813. During this time, amidst numerous enactments which they passed, they framed a totally new constitution for Spain, which has become known by the name of 'the Constitution of 1812,' the year in which it was proclaimed. This constitution established the representative system with a single popular chamber, elected in a numerical proportion of one deputy for every 70,000 individuals. The elections are not direct, but by means of electoral juntas or colleges, as in France: assembled citizens of every parish appoint, by open written votes, a certain number of delegates, who choose, by conference among themselves, one or more parish electors, in proportion to the population. All the parish electors, of every district, assemble together at the head town or village of the same, and there proceed to elect by ballot the electors for the district. All the district electors of one province form the electoral junta which assembles in the chief town of that province to appoint the deputies to the cortes, either from among themselves or from among the citizens who are not district electors, provided they are Spanish citizens born, in the full exercise of their civil rights, are more than 25 years of age, and have had their domicile in the province for at least seven years past. By Art. 92, a qualification was inserted of a yearly income, the amount and nature of which were left to the discretion of future

cortes to determine. Every district elector, in succession, steps up to the table where the president and secretary are, and tells the name of his candidate, which the secretary writes down. The scrutiny then takes place, and the majority of votes decides the election. The deputies elected receive full powers, in writing, from their electors, 'to act as they think best for the general welfare, within the limits prescribed by the constitution, and without derogating from any of its articles.' The deputies are allowed by the respective provinces a fixed emolument during the time of the sessions. The ordinary cortes assemble once every year, in the month of March, and the session lasts three or at the utmost four months. The deputies are renewed every two years.

These are the principles of the formation of the cortes, which, whatever may be their merits, have evidently little in common, except the name, with the old cortes of Castile or Aragon. With regard to the legislative powers of the cortes, their influence over the administration, and the authority which is left to the executive, we must refer the reader to the text of the Constitution. The king has a veto for two years following; but if the resolution be persisted in the third year his veto ceases. While we are writing this article, the cortes assembled at Madrid, December, 1836, are occupied in making modifications in the Constitution, especially by the establishment of a second chamber, but it is not yet known how it will be constituted.

The extraordinary cortes of Cadiz were succeeded in October, 1813, by the ordinary cortes, elected according to the principle of the Constitution. In January, 1814, they transferred their sittings to Madrid, which had been freed from the French. In March, of that year, King Ferdinand returned to Spain, and soon after dissolved the cortes, abrogated the Constitution, and punished its supporters. In 1820 the Constitution was proclaimed again through a military insurrection; the king accepted it, and the cortes assembled again. The king and the cortes however did not remain long in harmony. In 1823 a French army, under the duke of Angoulême, entered Spain; the cortes left Madrid, taking the king with them to Seville, and thence transferred him by force to Cadiz. Cadiz having surrendered to the French, the cortes were again dispersed, the Constitution was again abolished, and the liberals were again punished. This name of 'liberal,' which has become of such general use in our days, originated in the first cortes of Cadiz, where it was used to designate those deputies who were favourable to reform, whilst the opposite party were styled 'serviles.' (Arguelles, end of chap. v.)

The history of the first cortes of Cadiz has been eloquently written by Arguelles; that of the cortes of 1820-3 and of the subsequent royalist reaction, is found in numerous works and pamphlets of contemporary history, written with more or less party spirit, among which the least partial is perhaps the *Revolution d'Espagne, Examen Critique*, 8vo., Paris, 1836: it professes to be written by a Spanish emigrant, who, though no great admirer of the Constitution of 1812, speaks with equal freedom of the guilt and blunders of the violent men of both parties.

Ferdinand VII., before his death, in 1833, assembled the deputies of the royal towns, according to the ancient form, not to deliberate, but to acknowledge as his successor his infant daughter Isabella. Some time after his death the queen regent proclaimed a charter for the Spanish nation, which was called Estatuto Real. It established the convocation of the cortes and its division into two houses, the procuradores, or deputies from the provinces, and the procures, or upper house, consisting of certain nobles, prelates, and also of citizens distinguished by their merit. The power of the cortes however was very limited, the initiative of all laws belonging exclusively to the crown. This charter did not last above two years. In the summer of 1836 insurrections broke out at Malaga and other places, where the Constitution of 1812 was again proclaimed; and at last the insurrection spread among the troops which were doing duty at the queen's residence, at La Granja, in consequence of which the queen accepted the Constitution 'subject to the revision of the cortes.' The cortes were therefore convoked according to the plan of 1812, and assembled at Madrid in November, 1836.

The history of the cortes of Portugal is nearly the same as that of those of Spain, only that the towns which sent deputies were comparatively fewer, seldom more than ten or twelve at a time, and the influence of the privileged orders greater in proportion. The nobles having by de-

grees become courtiers, as in Spain, the kings reigned in fact absolute. In latter times there were less remains of popular freedom observable in Portugal than in Spain. In 1820, while King João VI. was in Brazil, a military insurrection broke out in Portugal, and a Constitution was framed in imitation of the Spanish one of 1812, but it was soon after upset. For an account of these transactions see Kinsey's *Portugal Illustrated*, 1828. After the death of King João, his son, Don Pedro, gave a charter to Portugal, establishing a system of popular representation with two houses; this charter was afterwards abolished by Don Miguel, and again re-established by Don Pedro. In 1836, soon after the affair of La Granja above mentioned, a fresh insurrection broke out at Lisbon, the charter was abrogated, and the Constitution of 1820 was again proclaimed.

The Aragonese, during their period of splendour, extended their representative system by brazos or estamentos to the island of Sardinia, then subject to the crown of Aragon, and the institution remains to this day under the name of Stamenti. They are convoked by the crown on particular occasions, chiefly to grant extraordinary supplies. [SARDINIA.]

CORTONA, a city and bishop's see in Tuscany, in the province of Arezzo, from which town it is fifteen miles distant south by east. It is built on the slope of a steep hill facing the south, and commands a splendid view of the fertile Val di Chiana, and of the Thrasymene lake. Its origin is lost in the remotest antiquity. Under the name of Corytum, it was one of the principal cities of the Etruscans. Its walls which still remain are of the structure called Cyclopean or Pelasgic, consisting of large polygonal stones put together without cement. About the middle of the fifth century of Rome we find Corytum allied to the latter, and it remained faithful to its alliance during the second Punic war, when Hannibal ravaged its territory before the battle of the Thrasymene lake. Little is known of its subsequent history, except that according to Dionysius and Pliny the elder, it received a Roman colony. History is likewise silent about Cortona, after the fall of the empire, until the end of the 12th century, when it appears as an independent municipal community, like most other Italian cities at that time, having its consuls, and its council composed of the majores milites, or nobles, and the capi d'arti e mestieri, or head tradesmen. It was repeatedly at war with its neighbours of Arezzo, whose bishop claimed temporal as well as spiritual jurisdiction over Cortona. Having taken the part of Frederic II., the people of Cortona were excommunicated by the Pope; but after the death of that emperor, they made their peace with Rome and became allied to the Florentines, when, in February 1258, they were suddenly assailed in the night by the people of Arezzo, who, at the instigation of their bishop Ubertini, scaled their walls, plundered the town, and razed their castle. Many of the citizens escaped to Perugia, but returned in 1261, by an agreement made with the bishop, who however continued to annoy them, till he was killed at the defeat of Campaldino by the Florentines in 1289. In 1325 Cortona was erected into a separate see by Pope John XXII. It then became subject to a powerful family called Casali, who assumed the title of Vicars Generals and Lords of Cortona for nearly a century. In 1409 the citizens being dissatisfied with their lord, called in the Neapolitan troops of King Ladislaus, who put to death Casali, took possession of Cortona, and then sold it two years after to the Florentines for 60,000 golden florins. From that time Cortona remained subject to Florence.

The city with its suburbs contains 5,000 inhabitants. Its territory is very fertile, especially in wine, corn, olive and mulberry trees. The high road from Florence to Perugia passes near Cortona.

The cathedral, built in the eleventh century, has some good paintings, and a fine basso rilievo of the Roman time. Several other churches and convents are also rich in paintings, especially by Luca Signorelli, a native of the place. There is a diocesan seminary for clerical students, a college kept by the fathers Scolopj, a conservatorio, or female house of education, kept by the nuns of Frances de Salis, and a school of drawing. The Accademia Etrusca, founded in 1726, has published several volumes of memoirs on Etruscan antiquities, and has a library with some valuable MSS., and a museum. Cortona has produced several distinguished artists and philologists. There is in the suburbs

a remarkable Etruscan monument, supposed to have been a sepulchre, of the same construction as the city walls; it has been named strangely enough La Grotta di Pittagora, some one having chosen to misplace the r in Cortona, thus making it into Crotona, the residence of that philosopher. (Repetti, *Dizionario Geografico Storico della Toscana*; Valéry, *Voyages Littéraires en Italie*.)

CORTONA, PIETRO BERRETTI'NI, called Pietro da Cortona, was born November 1, 1596, at Cortona. His first master was Antonio Commodi, but he afterwards studied under Ciampi, at Rome. Being employed by a gilder to make some little figures, his skill attracted the notice of the Marquis of Sacchetti, who visited the workshop, and Pietro was induced to show some of his paintings. The marquis took him at once under his protection, and procured him numerous commissions, and among them an order to paint some rooms in the palace of the reigning Pope Urban, in the Piazza Barberini. Cortona afterwards travelled, and executed various pictures by the way. He was employed by Ferdinand II. to paint some pictures in the Pitti palace, and stayed some time in Florence; but he left it in disgust, because the grand duke had listened to certain detractors, who had accused Cortona of palming his own pictures upon the prince in place of some of Titian's which Ferdinand desired to purchase of him. He settled finally in Rome, and enjoyed the patronage of successive pontiffs, until Alexander III. made him a knight. He died, oppressed with years and the gout, May 16, 1669, full of wealth and honour.

Pietro da Cortona studied the works of Raphael, Michel Angelo, and especially those of Polidoro da Caravaggio, from whom he learned to imitate the style of the later antiques, taking for his immediate model the sculpture of Trajan's column. His style of drawing is free, bold, and vigorous, and even coarse; seldom finished in any except the most conspicuous parts. In design he is learned and masterly, though somewhat mannered and overcharged. His colour is sober and harmonious. His principal works are at Rome, in the Barberini and in the Sacchetti palaces, and at Florence, in the Pitti palace.

Cortona practised architecture as well as painting. He was buried in the church of S. Martin at Rome, which is considered his best architectural work; and at his death he bequeathed to it a hundred thousand crowns.

Cortona had many famous pupils; among them were Ciro Ferri, Romanelli, Giordani, Borgognone, and Testa: the last was expelled from his school because he indulged in unworthy reflections upon his teacher's style, from which he nevertheless could never detach himself in after life. (Pascoli.)

CORUNDUM. Several substances differing considerably in colour, and sometimes in form, but nearly agreeing in composition, are classed together under the name of corundum, which is that given to the common variety by the natives of India.

1st. *Sapphire*, of which there are several varieties, the names of which are dependent chiefly upon their colour: the *white sapphire*, which is transparent or translucent; the *oriental sapphire*, which is blue; *oriental amethyst*, which is purple; the *oriental topaz*, yellow; the *oriental emerald*, green; and some other varieties occur, as the chatoyant and the opalescent sapphire. The sapphire occurs in rolled masses and crystallized, and the primary form of this and every variety of crystallized corundum is a slightly acute rhomboid, presenting a great variety of secondary forms; it usually occurs in the form of six-sided prisms variously terminated. Its specific gravity is 3.975 to 4.161; it possesses double refraction, and is inferior in hardness only to the diamond. Alone, before the blow-pipe it suffers no change; with borax it fuses slowly but perfectly, into a colourless glass; in one direction only the crystals cleave readily parallel with the faces of the primary rhomboid, and present a very brilliant surface; the cross fracture is conchoidal. The finest are found in Ceylon. According to the analysis of Chenevix, the sapphire consists of—

Alumina	92
Silica	5.25
Oxide of iron	1
	98.25

According, however, to Dr. Thomas Muir, this substance is pure alumina; containing no silica but what is abraded from the mortar. (Thomson's *Mineralogy*, &c., vol. i. p. 217.)

2nd. *Ruby*. Colour blood-red or rose-red, sometimes a tinge of violet; primary form as above, and generally occurs in six-sided prisms; it is not so hard as the sapphire, and is more readily cleaved. Chenevix's analysis gives—

Alumina	90
Silica	7
Oxide of iron	1.2
	98.2

But if the silica was derived from the mortar, as supposed in the case of the sapphire, then this substance, like it, must be regarded as alumina, nearly or quite pure.

Common corundum, the variety usually called *adamantine spar*, occurs like the sapphire and ruby, commonly in the secondary form of six-sided prisms, but usually much larger. It is sometimes nearly colourless, and rather translucent; it presents great variety of colour, but is most commonly greenish or greyish; occasionally brown or red, rarely blue. Although its most common form is the six-sided prism, it occurs, though rarely, also in acute and obtuse double six-sided pyramids. On account of its extreme hardness, it received the name of adamantine spar. It occurs in China, Bengal, Malabar, Tibet, the Carnatic, &c. It is used in the East Indies for cutting and polishing precious stones, and also granite and other hard rocks that are employed in the temples and other public monuments. According to Chenevix, the Carnatic corundum—and the other varieties differ but little,—yielded

Alumina	91
Silica	5
Oxide of iron	1.5
	97.5

Emery. This substance, which, when reduced to powder, is much used for polishing hard bodies, though very different in appearance from the preceding, is, on account of its hardness and analysis, regarded as amorphous corundum. Its colour is usually grey; its lustre is somewhat glistening. Its specific gravity is about 3.66 to 4; it occurs massive, and is granular. It is principally imported from the island of Naxos in the Archipelago, and was found by Mr. Smithson Tennant to consist of—

Alumina	86
Silica	3
Oxide of iron	4
	93

It occurs also in Italy, Spain, and Saxony; and it is said, in small quantities, also in Wicklow.

CORUNNA, or, more properly, CORUÑA (*Adrobicum* and *Coronium*), so named from *columna*, or the tower of Hercules, which still exists, and the origin of which has been referred as far back as the Carthaginians, but the learned Cornide brings it down to the reign of Trajan. It was converted, in 1791, at an expense of 40,000 dollars, into a lighthouse. This city stands on the neck of a peninsula, defended by a chain of bastions, at the entrance of the bay of Betanzos (the true Flavium Brigantium), and at the head of a spacious harbour, which is secure against all winds, except those blowing from the south and the east. It is further protected by two forts, one of which, that of St. Anthony, commands part of the road. Though not the capital of Galicia, it is the head-quarters of the military and naval force, and a considerable portion of the Spanish navy was formerly stationed here. Its commerce increased considerably by the opening of the American trade. It has still extensive manufactures of linen and baizes, and carries on considerable fisheries, especially of *sardinas*. Its population is about 22,000.

On the ramparts of the city the inhabitants have erected a monument to General Sir John Moore, who fell before the city, January 16th, 1809.

It is 28 miles north of Compostela, 30 miles north-west of Lugo; 43° 23' N. lat., 30° 20' W. long.

(*Descripcion del Reino de Galicia publicada de orden de la Junta de Gobierno*, por Don José Lucas Labrada.)

CO'RVIDÆ, crows, a family of *Coriostres*. The *bill* is strong, slightly cultri-rostral, or more or less compressed; the gape or commissure straight. The *nostrils* are covered with stiff bristle-like feathers directed forwards.

'The Nucifraga, Briss., our British nutcracker,' says Mr. Vigors, in his paper 'on the Natural Affinities that connect the Orders and Families of Birds,' Linn. Trans., vol. xiv,

p. 447, 'closely resembling the preceding groups' (fam. *Sturnidæ*) 'in the form of its bill, in conjunction with *Barita*, Cuv., introduces us into the family of *Corvidæ*. From that genus we may trace a line of affinities, through some intervening forms, to the *Jays* and *Rollers*, *Garrulus*, Briss., and *Coracias*, Linn., until we arrive at the *Corvus* of Linnæus, which again branches out into several groups closely allied to each other, but differing considerably in the structure of the bill. Hence we proceed by means of *Glaucopis*, Forst., to some genera, among which we may particularize *Ptilonorkynchus*, Kuhl, *Crypsirina*, Vieill., *Eulabes*, Cuv., and *Fregilus*, Cuv., which, in the metallic lustre of their plumage and the velvet-like process that in some species ornaments the face, indicate our approach to the *Birds of Paradise*. The last-mentioned genus *Fregilus*, in particular, by its curved and slender bill, brings us immediately into this group, the *Paradisææ*, Linn., which, in conjunction with the *Epimachus* of M. Cuvier, terminates the family of *Corvidæ*. Here we shall probably find the passage from the present to the succeeding family. The *Epimachus*, more united in its front toes than the *Corvidæ* in general, holds a middle station in respect to that character between the two groups; while in the length and curvature of its bill it approaches, in conjunction with many of the *Paradisææ*, to some of the extreme species of the *Buceridæ*, among which the *Buceros nasutus* of Dr. Latham may be instanced.' Mr. Vigors, in a note, says that he speaks with considerable hesitation as to the situation of *Epimachus*, which bears too strong a resemblance to the *Promerops* of M. Brisson, a group feeding on vegetable juices, with an extensile tongue, to permit him to separate it without some expression of doubt.

Mr. Swainson, in 'Fauna Boreali-Americana' (vol. ii.), thus writes on the *Corvidæ*: 'There are some singular and highly interesting peculiarities exclusively belonging to groups pre-eminently typical, which demand the deepest attention of the philosophic naturalist. One of the most striking of these is the great difference between those forms which belong to perfect and natural genera, *strictly so termed*. We might cite the restricted genera, *Tanagra*, *Cashmorhynchus* (*Casmarhynchus*), and *Coccothraustes*, as remarkable examples of this fact, and as groups which would repay the most minute analysis. This peculiarity sometimes extends to higher groups; and in the present family, the most pre-eminently typical in the whole circle of ornithology, it is more striking than in any other. It is perhaps to this circumstance that we must attribute the very imperfect manner in which the internal relations of the *Corvidæ* have been illustrated, and the artificial distribution that has been made of the groups it contains. Our space indeed will not permit us at present to throw much light upon the subject, further than what may be gained by studying the following table of sub-families.

1. Typical Group.

Analogies.	Sub-families.
CONIROSTRES. { Wings lengthened, obliquely pointed; lateral toes equal. }	<i>Corvidæ</i>

2. Sub-typical Group.

DENTIROSTRES. { Wings shorter, rounded, convex; lateral toes unequal. }	<i>Garrulinæ</i> .
---	--------------------

3. Aberrant Group.

SCANSORES. { Bill short, entire, light; feet short. }	<i>Crypsirinæ</i> .
TENUIROSTRES. { * * * * * }	?
FISSIROSTRES. { Bill slender, lengthened; feet short. }	<i>Fregilinæ</i> .

A glance at the modern arrangements will show how essentially we differ from all ornithologists who, like us, have attempted to elucidate this very intricate family. The tests, however, by which every series of animals thought to be natural must be tried will bring to light many remarkable peculiarities which belong only to the foregoing arrangement. Yet, however confident we feel on the general accuracy of this sketch, we are unprepared either to show in what manner the sub-families are connected, or to refer many of the modern genera to their natural divisions. The *Jays* (*Garrulinæ*) unquestionably represent the Bush-shrikes (*Thamnophilinæ*); while the genus *Crypsirina* and the short-legged *Glaucopinæ* of M. Temminck form part of a group typifying the Drongo Shrikes. The slender bill of the *Fregilinæ*, at the opposite side of the circle, indicates

the position of the Fissirostral group, corresponding to the *Buceridæ*. But we have many doubts on the true nature of the Tenuirostral type, since it must not only represent the Hang-nest Starlings (*Icterinæ*), but also the Caterpillar-catchers (*Ceblepyrinæ*) and the typical *Ampelidæ* or Chatterers. Now it will strike every ornithologist who has the means of examining the *Gracula calva* of authors, that notwithstanding its general resemblance to the *Chauve* of Le Vaillant (*Ois. de l'Amérique*, pl. 49), it is decidedly a crow; while the latter is considered by Le Vaillant as unquestionably belonging to the *Ampelidæ*. We have, therefore, good reason to suspect the *Gracula calva* to be one of the tenuirostral types of the *Corvidæ*. In all probability it will prove to be the sub-family type representing that tribe, although at present we choose to omit its designation in the foregoing table.

On the situation of such singular or apparently isolated genera as *Picathartes*, Less., *Podoces*, Fisher, and more particularly *Barita*, Cuv., we cannot at present give any opinion worth recording. [BARITA.] We suspect that *Nucifraga* is the scansorial subgenus of *Corvus*; and notwithstanding the confidence with which the genus *Coracias* has been referred, in the natural system, to this family, we have not the least hesitation in placing it with the *Fissirostres*. It is indeed almost inconceivable that the strongest prejudice in favour of any theory, professing to follow natural affinities, could so far have blinded the judgment of a naturalist as to make him separate *Colaris* from *Coracias*, and to violate nature by placing these two forms (so intimately allied that we scarcely know how to distinguish them), not only in two distinct families, but actually in two widely situated tribes. Setting aside every other consideration, and looking merely to the wide gape, which has been so much insisted upon as a peculiarity of the genus *Colaris*, we find that this character is incontestably as much developed in *Coracias*: although a superficial observer, deceived by the length of the bill in the latter, will be led to think quite differently. Both genera, in fact, would be correctly described as having the *rixtus wide, opening half way beneath the eye*. A passage in Mr. Vigors's and Dr. Horsfield's 'Description of the Australian Birds in the Collection of the Linnean Society' (*Linn. Trans.*, vol. xv.), is referred to in the observations above quoted. In a note to the word tribes, the following words are quoted: 'Judging however from external characters, we have no hesitation in stating our opinion that these relations (between *Colaris* and *Coracias*) are merely analogical.' (*Linn. Trans.*, xv. p. 203.) The following is the part of the paper alluded to—'This bird (*Eurystomus*, Vieill., *Colaris*, Cuv., *Coracias Orientalis*, Linn.), which seems to spread itself very generally over the eastern world, was originally placed by Linnæus among the *Rollers*, or his genus *Coracias*; and although it has latterly been formed into a distinct genus from that group, it has still been arranged next to it by the greater number of systematic writers. M. Vieillot, observing the extreme width of the base of the bill, grouped it among the *Berry-eaters* (*Baccivori*), a family which he formed out of the genus *Ampelis*, Linn., and some conterminous birds. He however still assigned it a station in the series of his genera, immediately subsequent to the Linnean genus *Coracias*. The bird evidently exhibits strong relations to both these groups. In its colours, its size and strength, and its general form, it bears a resemblance to the *Rollers*; while in the wide gape of the bill it equally seems to approach the broad-billed *Berry-eaters*. Judging however even from external characters, we have no hesitation in stating our opinion that these relations are merely analogical, and that the natural station of the bird is in the tribe of *Fissirostres*, but at that extremity of the group where it joins the *Dentirostres*. The shape of the wing, evidently formed for a rapid flight—the comparative shortness and weakness of the legs, indicating the pursuit of an aerial rather than of a terrestrial prey—and the notched apex of the bill, denoting its food to be rather animal than vegetable—all are characters which point out its affinity to the *Fissirostral* group, whose perfection consists in their powers of flight, and of inclosing their prey within their gape, as they pursue it on the wing. The brilliant colours of this bird, which have hitherto led to its being placed among the *Rollers*, equally associate it with the present family of *Todidæ** and with the neighbouring *Halcyonidæ*, while the bill appears decidedly formed according to the same model as that of *Eurylaimus* and the

* Under which it is placed by MM. Vigors and Horsfield.

conterminous group of *Podargus*. We had much pleasure in finding that our conjectures respecting the affinities of this group, which we had drawn merely from its external characters, were confirmed by the account of its habits and mode of life, which we have extracted above from Mr. Caley's manuscripts. We must observe, in addition, that this naturalist, arranging his birds without any predilection for systems, and in consonance merely with what appeared to him to be their natural affinities, of which he formed his judgment by actual observation of their manners, has grouped these birds in the same case with the *Caprimulgi*, *Podargi*, *Hirundines*, and *Artami*, in which situation they may still be seen.*

Lesson, in his 'Manual,' divides the Corvidæ into two sections. 1. The true Crows; and 2. The Birds of Paradise (Les Paradisiens).

Genera. Corvus.

Bill straight, large, compressed, and a little swollen on the sides; convex and curved towards the point, its edges cutting. *Nostrils* open. *Fourth quill* the longest. *Tail* even, rounded, or rectilinear.

'The genus *Corvus*,' says M. Lesson, 'is very numerous in its species. Birds which differ in their characters and habits from the crows, properly so called—which are the largest of the Passeres, whose way of life is carnivorous, and their food composed of all sorts of substances, especially carrion—have been joined to the genus. The crows possess much intelligence, are easily tamed, and become very familiar. They are very voracious and live in numerous bands, and their harsh cry has been called *croaking*. They often commit such havoc, that a price is set on their head in some countries. They have at all times been objects of superstition to the people. Some of the crows are sedentary, others again are travellers, and migrate annually. They moult but once a year.'

Geographical Distribution. The genus is found in all the four quarters of the globe.

Example. Corvus Corax. This well-known bird is the *Kópaξ* of the Greeks, *Corvus* of the Latins, *Corvo*, *Corbo*, and *Corvo grosso* of the modern Italians, *El Cuervo* of the Spaniards, *Corbeau* of the French, *Der Rabe* and *Der Kolk-rabe* of the Germans, *Korp* of the Swedes, *Raun* of the Danes, *Raven* of the English, *Corbie* of the Scotch, *Cig-fran* of the antient British, *Kaw-kaw-gew* of the Cree Indians, and *Toolloo-ak* of the Esquimaux. Dr. Richardson says that it abounds in the fur countries, and visits the remotest islands of the Polar seas. 'It frequents the barren grounds even in the most intense winter colds, its movements being directed in a great measure by those of the herds of rein-deer, musk-oxen, and bison, which it follows, ready to assist in devouring such as are killed by beasts of prey or by accident. No sooner has a hunter slaughtered an animal than these birds are seen coming from various quarters to feast on the offal; and considerable numbers constantly attend the fishing stations, where they show equal boldness and rapacity. The experienced native, when he sees from afar a flock of ravens wheeling in small circles, knows that a party of his countrymen, well provided with venison, are encamped on the spot, or that a band of wolves are preying upon the carcase of some of the larger quadrupeds, and pushes on briskly in the certain prospect of having his wants supplied. The thievish habits of a tame raven are well known; but it is remarkable that, inhabiting in a wild state the most secluded and worst peopled districts of America, it should exhibit the same disposition to carry off shining metallic bodies, and other articles, totally unfit either for food or to be used in the construction of its nest. Mr. Kendall, in crossing the height of land which divides the waters that flow towards Hudson's Bay from those which fall into the Arctic sea, saw a raven flying off with something in his claws, pursued by a number of his clamorous companions. The bird being fired at dropped the object of contention, which proved to be the lock of a chest.'

The aptitude of the raven for articulating clearly is generally admitted. Mr. Swainson says, 'One belonging to Mr. Henslow, of St. Alban's, speaks so distinctly, that when first we heard it we were actually deceived in thinking it was a human voice: and there is another at Chatham which has made equal proficiency; for, living in the vicinity of a guard-house, it has more than once turned out the guard, who thought they were called by the sentinel on duty.'

Variety.—Dr. Richardson (*Fauna Boreali-Americana*), states that a pied individual was killed on the south branch of the Mackenzie, from a flock of the common sort. Its neck, fore part of the back, and part of the wings were grey; the rest of its plumage black.

Locality.—'This,' writes Dr. Latham, 'is a universal species, found both in the old and new continents; from Greenland to the Cape of Good Hope in the one and from Hudson's Bay to Mexico in the other. It was also met with by our circumnavigators in the Sandwich Isles, and at Owhyhee was held in great estimation.' Its appearance is recorded in the first and second voyage of Parry as occurring within the Arctic circle, and in Franklin's Journal. Several pairs were seen at Melville Island, and Dr. Richardson gives a description of one killed at Fort Franklin in March, 1826.

Captain James Ross (Appendix to Sir John Ross's second voyage, p. 28), speaking of the raven, says, 'This is one of the few birds that are capable of braving the severity of an Arctic winter and of enduring the scorching rays of a tropical sun without any change being produced in its plumage by the extremes of climate. Cuvier and other authors mention that in the north it is frequently found more or less white: we never saw anything corroborative of such an observation. It preserves its plumage and peculiar characteristics unchanged in every quarter of the globe*.'

There are several other European and foreign species. Most of the former are known to every countryman, and the student will find both in the ornithological manuals.

Pica.

Bill entire, with cutting edges, straight or curved, furnished at the base with setaceous feathers, lying forwards. *Tail* very long, graduated. (Vieillot).

The *Picæ*, magpies, feed much in the same manner as the true crows, build their nests in trees, advance on the ground by hopping, are clamorous, learn to articulate words easily, and the European species is renowned for hiding anything shining and portable that pleases its eye. This bird also has been always an object of superstition with the vulgar; and as it may be considered a typical form, we take it as an example.

Pica caudata of Ray, *Corvus Pica* of Linnæus, our common Magpie, or Pianet, is, there is hardly any doubt, the *kirra* of the Greeks, the *Pica* of the Latins, *Gazza*, *Regazza*, *Putta*, *Picha*, *Gazuola*, *Gazzara*, *Ghiandara*, *Gaggia*, and *Gaggia domenicana* of the modern Italians, *Pie*, *Jaguette*, *Dame*, and *Agasse* of the French, *Die Elster*, *Die Aelster*, or *Aglaster* of the Germans, *Skade* and *Huus Skade* of the Danes, *Skior* and *Tunfugl* of the Norwegians, *Piogen* of the antient British, *Ootawa-kee-askee* of the Cree Indians, and *Shepecum-mewuck* of the Maskegons.

The magpie is too well known to need description. It is omnivorous, and lays six or seven oblong eggs of a yellowish white, spotted with brown, and cinereous: its nest, well fortified with blackthorn twigs, is a curiosity. The female is rather less than the male, and her tail is shorter.

'This bird,' says Dr. Richardson (*Fauna Boreali-Americana*), so common in Europe, is equally plentiful in the interior prairie lands of America; but it is singular that though it abounds on the shores of Sweden and other maritime parts of the Old World, it is very rare on the Atlantic coasts of America, or near Hudson's Bay: only stray individuals passing to the eastward of the Mississippi or of Lake Winnipeg. Mr. Say informs us that it winters on the Missouri, and takes its departure northwards on the 23rd of March. It does not entirely quit the banks of the Saskatchewan even in winter, but is much more frequent in summer. On comparing its eggs with those of the European bird, they are found to be longer and narrower; and though the colours are the same, the blotches are larger and more diffused. The manners of the American bird are precisely the same that we are accustomed to observe in the English one.' Mr. Swainson adds, that he has been able to compare English and Arctic specimens with one from the interior of China, communicated to him by Mr. Gray, and that he cannot perceive the slightest difference whereon to

* The reader is desired to add the following information to the account of the geographical distribution of the passenger pigeon, *Ectopistes migratoria*, *Columba migratoria* of authors, in the article *Columbidae*. 'A young male bird flew on board the Victory during a storm, while crossing Baffin's Bay, in lat. 73° N., on the 31st July, 1829. It has never before been seen beyond the sixty-second degree of latitude; and the circumstance of our having met with it so far to the northward is a singular and interesting fact.' (Captain James Ross, Appendix, p. 29.)

build even the character of a variety, much less of a species. The tails of the Arctic specimens, he observes, are very beautiful.

Variety.—White.

There are several foreign species. They occur both in the Old and New World.

Dendrocitta.

A genus founded by Mr. Gould, and comprehending *Pica Vagabunda* of Wagler, *Pica Sinensis* of Hardwicke and Gray, and a third species, which Mr. Gould believes to have been hitherto unnoticed.

Generic Character.—Bill shorter than the head, cultrated, broad at the base, culmen arched, sides subtumid; nostrils basal, partly covered with setaceous feathers. Wings moderate; fifth and sixth quills longest. Tail elongated, cuneated, the tail-feathers spatulate. Feet (tarsi) short and weak; toes moderate; hallux strong, with a strong incurvated claw.

Generic Type.

Dendrocitta leucogastra. Black; occiput, neck, transverse stripe at the base of the quills, and abdomen white; scapulars, interscapular region (*interscapulio*), and lower tail-coverts tinged with chestnut (*dilute castaneis*); two internal tail-feathers ash-coloured, except at their tips.

'The shortness and comparative feebleness of the tarsi in *Dendrocitta*, and its more elongated tail, the feathers of which are equally graduated, except the two middle ones, which are much longer than the others, distinguish it from the typical *Picæ*, the common magpie, for example. These characters are in accordance with its habit of wandering from tree to tree in search of its food. It is farther distinguished by the form of its bill.'

'All the species yet known are natives of Eastern Asia.' (Gould, *Zool. Proc.*, May 14, 1833.)

Example, *Dendrocitta vagabunda*, *Pica vagabunda*, Wagler. Head, neck, and crest of a smoke colour, or blackish grey; the back light cinnamon; the centre of the wings grey; the quills black; the tail grey, each feather being tipped largely with black; under surface pale tawny; beak and tarsi black. Length 16½ inches; beak 1½; tarsi 1½; tail 10. The species is more widely diffused than any of its congeners, being found in considerable abundance all over India. (Gould, *Century of Birds from the Himalaya Mountains*.)

Garrulus.

Bill moderate, straight, with cutting edges, inclined, and with obscure notches near the point. Tail even, sometimes rounded. (Vieillot).

The jays are inhabitants of the wooded districts, and live chiefly upon fruits, principally acorns and such vegetable productions. They rarely come into the open country, but make great havoc in gardens and cultivated grounds in the neighbourhood of woodlands. Their food is much less varied than that of the true crows; but they may still be styled omnivorous. Their plumage is generally gay, and even brilliant: the beautiful speculum on the wing is a leading character. The manners of the foreign species are analogous to those of the foreign magpies. Those of the common jay and its aptness at imitation are well known.

Example, *Garrulus glandarius*, the common jay, which is supposed by Belon to be the Μαλακοκρανίδης (*Malacocra-neus*) of Aristotle; and we may observe, in confirmation of this opinion, that the editor of the last edition of Pennant says, that the bird is very common in Greece, where it still retains its antient name, Μαλακοκρανίδης. Belon states it to be the *Gaza Ghiandaia*, or *Ghiandara*, the *Gaza verla* and the *Berta* of the modern Italians; and C. Bonaparte gives *Ghiandaja*, *Pica*, *Pica ghiandaja*, and *Pica palombina* as its Italian appellations. It is the *Jay* and *Geai* of the French, the *Eichen-heher* (oak-jay), *Holtzschrayer* (wood-cryer), or *Holzeher* of the Germans, and *Screch y Coed* of the antient British.

The jay is too well known to require description. It builds its basket-like nest in trees or high coppice wood and hedges, and lays five or six eggs of a dull whitish olive, mottled very obscurely with pale brown; towards the large end there are usually two or three black lines. It is a sad enemy to gardeners; fruits, especially cherries, and peas, are its great favourites, and it is frequently taken by springes

set upon the rows of peas when in bearing. Dr. Kramer says that it will kill small birds. With regard to their imitative powers, Bewick says, 'We have heard one imitate the sound made by the action of a saw so exactly, that though it was on a Sunday, we could hardly be persuaded that the person who kept it had not a carpenter at work in the house. Another, at the approach of cattle, had learned to hound a cur dog upon them, by whistling and calling upon him by his name. At last, during a severe frost, the dog was, by that means, excited to attack a cow big with calf, when the poor animal fell on the ice, and was much hurt; the jay was complained of as a nuisance, and its owner was obliged to destroy it.'

Varieties.—Dr. Latham says he has seen two varieties; the one pure white, the other as in the common jay, but having the whole of the quills white.

Locality.—The author last quoted states that this species, though not nearly so far spread as the magpie, exists in various parts of the continent of Europe, and that he has observed it among drawings done in China.

There are several foreign species, both of the New and Old World. Mr. Gould, who figures three species in his 'Century of Birds,' well observes that, 'The close affinity which the *Garrulus lanceolatus* bears to some species inhabiting the United States and Mexico is worthy of remark, as a corroboration of the fact so often insisted on, that similar forms of ornithology are found in countries widely separated from each other, whose temperatures are alike.' Indeed, the last-mentioned bird immediately reminds the observer of the blue jay (*Garrulus cristatus*) of America, while *Garrulus bispecularis* recalls the common jay to his recollection.

Picathartes.

A genus founded by M. Lesson, who takes for the type the *Pie chauve* (*Corvus gymnocephalus*) of Temminck.

Generic character.—Bill convex, not very robust, the upper mandible higher than the lower; the latter a little swollen towards its extremity; the base entirely without hairs and furnished with a cere. Nostrils placed on the middle of the bill, oval, open, hollowed into an oblong excavation. Head entirely naked. Feet (tarsi) long, but little scutellated in front, naked behind; claws feeble; wings rounded, short. Tail long, graduated. (Lesson.)

'The form of this singular bird,' says M. Temminck, 'the cut of its wings, and its long, conical, and very graduated tail, serve me as indicia to judge by analogy of what country it may be a native, its locality being unknown. In fact, on comparing our new species with the *Piapi* of Le Vaillant (*Corvus Senegalensis*), one is inclined, from the marked analogy, to conclude Africa to be its country. Some data, which it is nevertheless not prudent to trust, lead me to believe that the only individual known, which is in the collection of Mr. Leadbeater of London, was brought from the English possessions on the coast of Guinea.'

'Proportions (taille) a little stronger, tarsi much longer, and a tail less in proportion distinguish our bird from the *Piapi*. The head in certain points offers some resemblance to that of the *Gracula calva* of the Philippines, and this approximation is so strong that it would produce doubts as to its African origin, if it did not bear a greater resemblance in its general contour to the *Piapi* of Africa. In fine, if this bird is not African, it can only be a native of the Philippine islands.'

Upon this passage M. Lesson remarks, that he does not find the least analogy between the figure of the Enlum, 538, which is the *Corvus Senegalensis*, and the *Pie chauve*, which more resembles a *Cathartes*. The conclusion stated in M. Temminck's last sentence M. Lesson is far from admitting.

The following is Temminck's description of the species: 'The naked parts of the head offer a particular character. The whole of the auditory meatus is completely destitute of feathers and even of hairs. A small border, or rudiment of membrane, forms, below the orifice of the ear, a sort of external concha, but little apparent, it is true, in the stuffed specimen, but the extent of which must be remarkable in the living bird. All this part of the organ of hearing, as well as a part of each side of the occiput, are covered by a black skin with a slightly-projecting orbicular border, and forming a rounded plaque. The cere which envelopes the base of the bill is also black. All the rest of the naked parts of the head, the mesial line of the occiput which sepa-

rates the black *plaques* of the temples, and the upper part of the top of the neck, appear to me to have been red or rosy in the living subject; a slight tint of rosy-yellow covers these parts in that before us. The whole of the nape is covered, clearly, by a whitish and very short down. The front of the neck and all the other parts are white. The back, well covered with thick-set feathers, is of an ashy-black; all the rest of the plumage is bistre brown. The feet are yellow, and the bill is black. Length 15 inches. (Temm.)

[*Picathartes gymnocephalus*.]

Podoces.

This genus was founded by M. Fischer, for a bird discovered by Dr. Pander, in the country of the Kirguis beyond Oremburg, whose habits of life are analogous to those of the crows, among which M. Lesson thinks it ought to be placed.

Generic character.—Bill moderate, of the length of the head, bending downwards at its point, without a notch, and slightly angular, the upper mandible shorter than the lower, receiving and covering the edges of it. *Nostrils* basal, rounded, large, covered with setaceous overhanging feathers (*plumes setacées retombantes*). *Feet* robust and long; *claws* triangular, very much pointed, and but little curved; a warty membrane bordering the thickness of the phalanges. *First quill* short, *second* long, the *three next* equal. *Tail* rectilinear. (Fischer.)

Example, *Podoces Panderi*. Greenish glaucous above; eyebrows white; bill and claws blackish; feet greenish.

The bird flies badly but walks very well. It lives in flocks.

Myophonus.

Bill very large, strong and hard, furnished at its opening with some stiff bristles and small feathers turned forwards. *Nasal fossæ* sub-oval, closed by a large membrane. *Wings* rounded, moderate. *Quills* nearly equal, the third longest. *Feet* very long, demiscutellated. *Tail* rounded.

There are several species, all oriental. Mr. Gould, who has published two, viz.: *Myophonus Horsfieldii* and *M. Temminckii*, in his 'Century,' states that, as regards the habits of these birds, little can be said with certainty, but that from their lengthened tarsi and general structure they may be considered as depending in a great measure for their subsistence upon worms, insects, and larvæ. The

[*Podoces Panderi*.]

manners of *M. Temminckii*, when on the ground, are said much to resemble those of the English blackbird. It may be questionable whether this group is properly placed among the *Corvidæ*.

Example, *Myophonus flavirostris* (*metallicus*, Temm.) Entirely of a deep blue-black with metallic tints. *Bill* of a beautiful yellow. *Feet* black. Locality, Java.

[*Myophonus flavirostris*.]

Ptilonorhynchus.

Bill strong, robust, widened, rather long, upper basal termination convex but little marked; point recurved; upper mandible presenting two small notches at its extremity; edges a little swollen; lower mandible slightly convex; commissure of the mouth straight, simple. *Nostrils* basal, lateral, furnished with short bristles. *Wings* short, rounded. *Tail* moderate, graduated. *Feet* slender. (Lesson.)

The genus, as modified by Lesson, contains but two species. He thinks that it would be better placed among the *Dentirostres* at the side of the *Choucaris* (*Graucalus*, Cuv.), but he allows that it has all the forms of the *Rolliers* (*Coracias*) and of the *crows*. Locality, the warmest islands of the West Indian Archipelago.

Example, *Ptilonorhynchus Sinensis*, *Coracias Sinensis*, Lath. Body above pale aqua-marine green clouded with yellowish-green. Forehead furnished with silky round feathers, turned in different directions; feathers of the nape long, unravelled as it were, and capable of being erected into a tuft—both of a yellowish-green. A black band taking its rise from the angle of the bill surrounds the eye and nape. Throat and cheeks of a yellowish-green. Lesser wing coverts brown. Quills brown, inclining to olive externally, and chestnut internally; the three last progressively terminated with greenish white. Bill red, surrounded by a few black bristles; feet reddish. Size eleven inches. Locality, the Philippine islands.

[*Ptilonorhynchus Sinensis*.]

The other species, according to Lesson, is *Kitta thalassina*, Temm.

Kitta.

Bill short, convex, compressed on the sides; upper mandible with the basal termination recurved, and depressed sides; the point sharp and furnished on each side with a small projecting tooth, borders of the mandibles thick, recurved, and covered at the commissure. *Nostrils* basal, transversal, hidden by the silky feathers of the forehead, and by a row of small bristles. *Wings* pointed. *Tail* equal, rounded. *Feet* robust; toes equal; *hallux* strong. (Lesson.)

Lesson, who places in this genus *Kitta holosericea*, *Ptilonorhynchus Smithii* and *Kitta virescens*, says that what was observed as to the last-mentioned genus is applicable to

this, which has the general characters of the *Rolliers* and *Rolles* (*Colaris*).

The birds composing the genus are exclusively peculiar to New Holland and the temperate zone. (Lesson.)

Example, *Kitta holosericea*, Temm.; *Ptilonorhynchus holosericeus*, Kuhl; *Satin Grakle*, Latham; *Ptilonorhynchus Mac-Leayii*, Latham MSS., Vigors and Horsfield.

Male, very brilliant blackish-blue. Quills and tail-feathers dead black. Bill and feet yellow. A double row of silky and velvety bluish-black feathers at the base of the bill. Length thirteen inches. The *female* has the upper parts of an olive-green. The quills and tail feathers of a red-brown; wing coverts varied with brown and a colour inclining to olive; lower parts greenish, barred with black. There are whitish horizontal spots, lanceolated and bordered with black, on the front of the neck.

Mr. Caley says (Vigors and Horsfield, *Linn. Trans.*, vol. xv., p. 264) that 'the male of this species is reckoned a very scarce bird, and is highly valued. The natives call it *Cowry*, the colonists *Satin Bird*. I have now and then met with a solitary bird of this species: but I once saw large flocks of them on some newly-sown wheat, from whence they fled, on being scared, into a neighbouring brush; when all was again quiet they soon returned to the wheat. They did not leave the brush above a few yards. There were no black ones among them, nor can I affirm that they were feeding on the wheat.

[*Kitta holosericea*.]

Nucifraga.

Bill long, thick, with cutting edges terminating in a blunt point, furnished with setaceous feathers at the base, the upper mandible longer than the lower. *Nostrils* round, open. *Wings* pointed; fourth quill longest.

Till the publication of Mr. Gould's *Nucifraga hemispila*, (see 'Century of Birds,') but one species was known, viz., that which we select as the example.

The *Nutcracker*, *Nucifraga Caryocatactes*, Brisson; *Caryocatactes nucifraga*, Nils. *Corvus Caryocatactes*, Lin., is the *Casse-noix* of the French, the *Tannenheher* of the Germans, the *Noddekrige* of the Danes, the *Not-kraake* of the Norwegians, and the *Aderyn y cnau* of the antient British.

Description.—Somewhat less than the jackdaw: the bill straight, strong, and black. Head, neck, breast and body, rusty brown. Crown of the head and rump plain, the other parts marked with triangular white spots. Wings black. Coverts spotted like the body. Tail rounded at the end, black, tipped with white. Legs dusky. Locality, most

parts of Europe: but C. Bonaparte does not notice it in his 'Specchio Comparativo.'

Pyrrhocorax.

Bill moderate, compressed, subulate, rather slender, furnished at the base with feathers directed forwards, and at the extremity of the upper mandible with two small teeth which are often wanting. *Nostrils*, basal, ovöid, open, hidden by bristles. *Feet* robust, claws strong and recurved. *Fourth* and *fifth* quills longest.

These birds, the *Choquards* of the French, live in troops like the jackdaws, which they resemble in their manners. They inhabit the high mountains of Europe, and especially the snowy regions of the Alps. They are omnivorous, feeding on insects, worms, soft fruits and seeds. They moult once a year, and the sexes are alike externally.

Example. *Pyrrhocorax Pyrrhocorax*. Brilliant black, but the colour is dull in youth, and the bill and feet are black. In the adult bird the black presents iridescent and changeable tints varying to greenish, the bill is yellowish, and the feet bright red. The female lays four white eggs, spotted with dirty yellow; the nest is in holes of the rocks. Locality, Alps of Switzerland. C. Bonaparte ('Specchio Comparativo') notes it as rare, and as only occurring in the Apennines.

Fregilus.

Bill longer than the head, slender, entire, arched, pointed. *Nostrils* covered with feathers directed forwards.

M. Lesson is of opinion that this genus ought to be united with the last, from which it only differs in having the bill longer and more curved, which made Cuvier place it in the tribe of *Tenuirostres* near the *Hoopoes* (*Upupa*). The species have the manners, habits, and general organization of the crows. And the European species (selected here as an example) perfectly resembles *Pyrrhocorax*. (Lesson.)

Pyrrhocorax graculus, Temm. *Corvus graculus*, Linn. The *Cornish Chough*, or *Red-legged Crow*, is considered by Belon, on no bad grounds, to be the *Kopakias* (Corakias), the *Kopónη φοινικόρυγκος* (Red-billed Crow) of the Greeks, and the *Pyrrhocorax* of the Latins; *Spelvier*, *Taccola*, *Pason*, *Zorl*, of the modern Italians (Belon); *Choucas aux pieds et bec rouge*, *Choquar*, *Chouette rouge* of the French (Belon); *Stein-tauchen* and *Stein-frae* of the Germans, and *Brân big gôch* of the antient British.

Back beautifully glossed with blue and purple. Legs and bill bright orange, inclining to red. Tongue almost as long as the bill, and a little cloven. Claws large, hooked, and black. The chough builds its nest in high cliffs or ruined towers, and lays four or five eggs, white, spotted with dirty yellow or light brown and ash colour.

Locality.—In Britain: Devonshire, Cornwall, and Wales. Pennant says that it is found in different parts of Scotland, as far as Straithnavern, and in some of the Hebrides. He also states that it is found in small numbers on Dover cliff, where they came by accident; a gentleman in that neighbourhood had a pair sent as a present from Cornwall, which escaped and stocked those rocks. They sometimes desert the place for a week or ten days at a time, and repeat it several times in the year. Montagu, speaking of this locality, says, 'We believe the breed in those parts is again lost.' Dr. Latham states that it is also said to frequent the South Downs about Beachy Head and Eastbourne, where it is called the Red-billed Jackdaw. With regard to its general geographical distribution, Pennant observes that we do not find it in other parts of Europe except England and the Alps. In Asia the island of Candia produces it. In Africa, Egypt; which last place it visits towards the end of the inundations of the Nile. He quotes Pliny, Brisson, Belon, and Hasselquist, for these statements. The editor of the last edition of Pennant says that the chough inhabits the lofty cliffs about the mid region of the highest mountains of Greece, but never the maritime parts as with us. Scopoli speaks of it in Carniola, and says that the feet of some during autumn turn black. These were probably young birds.

The Cornish chough is easily tamed, and may be taught to speak. One in Colonel Montagu's possession would stand quietly for hours to be soothed and caressed, but would resent an affront both with bill and claws. 'It is,' says Pennant, 'active, restless, and thieving; much taken with glitter, and so meddling as not to be trusted where things of consequence lie. It is very apt to catch up bits of lighted

sticks, so that there are instances of houses being set on fire by its means; which is the reason that Camden calls it *incendiaria avis*.' Several of the Welsh and Cornish families bear this bird in their coat of arms.

There are foreign species, *Fregilus leucopterus*, Vigors and Horsfield, *Pyrrhocorax leucopterus*, Temm., from New Holland, where it is called by the natives Waybung, according to Mr. Caley, and *Fregilus Enca*, of Horsfield, from Java, for instance.

Paradisea.

[See BIRD OF PARADISE.]

Astrapia.

Bill smooth at the base, compressed laterally, straight above, pointed, notched and bent towards the extremity. *Tail* very long and very graduated.

A genus founded by M. Vieillot for a bird of the most brilliant plumage, which, with other characters, places it near the *Birds of Paradise*, while it has several points which would lead to arranging it among the *Thrushes*. Thus Gmelin gave it the name of *Paradisea nigra*, and Latham that of *Paradisea gularis*, while Cuvier considered it to

[Pie de Paradis.]

come under the genus *Turdus* (*Merle de la Nouvelle Guinée*). This beautiful bird is the *Pie de Paradis* or *Incomparable* of the French. M. Lesson says, 'I brought from New Guinea two individuals of this magnificent bird, the value of which is sufficiently considerable in France, and which seems to be very rare even in its native country; for during our sojourn at the Moluccas and the land of the Papous, I only saw there two birds, and one of these now embellishes the galleries of the museum where I deposited it.'

No description can convey any idea of the brilliancy of this bird. The metallic tints of almost every hue, varying with the play of the light on the plumage, almost surpass belief. It is well figured in Le Vaillant's '*Oiseaux de Paradis*,' pl. 20 and 21; but no colouring can give the slightest notion of its splendid intensity and variety. The form may be imagined from the annexed cut taken from the plates above mentioned.

FOSSIL CORVIDÆ.

Dr. Buckland mentions the remains of the raven as occurring in the cave at Kirkdale, and figures the right ulna of one of those birds in '*Reliquiæ Diluvianæ*,' plate xi.

The other allied forms alluded to in this article, viz. *Crypsirina*, *Epimachus*, *Eulabes*, &c., will be adverted to under those titles.

CORVO, one of the Azores, or Western Islands, and the northernmost of the whole group, lying 10 miles N. of Flores. It is high to the north, and slopes gradually to the south; it contains about 750 inhabitants, and produces the best wheat of all the Azores; cattle, sheep, and hogs are abundant, but wood and water are scanty. It has only a small port for the boats trading among the islands. It is three miles long and two broad. The north point is in 39° 44' N. lat., and 31° 0' W. long.

CORVUS, the Crow, sometimes *Hydra et Corvus*, because this constellation, in fact, contains a part of the body of Hydra, on which the bird rests. In Aratus, Hydra, Crater, and Corvus form one constellation. There are mythological stories, apparently not very antient, in Hyginus.

CORYLA'CEÆ, a highly important natural order of aetalous or incomplete exogens, consisting of trees or shrubs, chiefly natives of the colder parts of the world, and valuable either for the nuts they bear or the timber they produce. The oak, the beech, the hazel, the hornbeam, and the sweet chestnut, all belong to this order, the general character of which is briefly this: leaves alternate, usually serrated, often with veins running straight from the midrib to the margin, beyond which they slightly project; at the base of each leaf a pair of membranous stipules. Flowers monœcious. The males in catkins; the females in bud-like clusters. Stamens from five to twenty, arising from the scales of the catkin. Ovary inferior, crowned by a toothed obsolete calyx, seated in a membranous cup or involucre, with more cells than one, and as many styles as cells; ovules solitary or in pairs, pendulous; all the ovules except one, and all the cells, disappear after the flowering is over, and when the fruit is ripe there is but one cell and one seed, whatever their number may originally have been. Fruit, a nut (called also acorn, mast, &c.), enclosed within a peculiar kind of involucre or *cupule*, composed of bracts more or less united together, and forming a cup in the oak, a husk in the filbert, and a spiny case in the chestnut and

beech. The seed consists of a roundish embryo, with thick fleshy cotyledons, and no albumen. For particulars concerning the important genera of this order, see *QUERCUS*, *FAGUS*, *CARPINUS*, *CASTANEA*, *OSTRYA*, *CORYLUS*. This order is also called *Cupuliferæ*.

[Flowers of the Hazel Nut.]

1, a branch, with the male flowers ** in drooping catkins; the females * in bud-like clusters. 2, one of the scales of the male catkin, with the stamens attached to it. 3, a female bud, with the styles projecting beyond the bracts. 4, the young ovaries with the bracts removed. 5, a section of the ovary, exhibiting the ovules, the toothed calyx, and the base of the style. 6, a cross section of the ovary. 7, a longitudinal section of a nut.

CORYLUS, the genus of plants after which the natural order Corylaceæ receives its name. It consists of the different species of hazel-nut, and is distinguished from the genera associated with it by its cupule being a two-leaved lacerated husk, and its ovary having but two cells, in each of which is one ovule. The species are the following:—

1. *C. avellana*, the common hazel-nut. This plant, which is a native of all the cooler parts of Europe, Northern Asia, and North America, is the parent of the many varieties of nuts and filberts now cultivated for their fruit. [**HAZEL-NUT**, **FILBERT**.] It is specifically known by its husks being hispid with glands, leafy, broad, much lacerated, and rather spreading at the point; never contracted into a long tube, nor divided into narrow rigid segments; by its roundish, heart-shaped, very rugose, angular, toothed, cuspidate leaves, glandular-hispid branches, and shrubby habit. It varies very much in the form of its husks, in the degree of their hispidity, some being nearly smooth, in the shape of the nuts, and in the height to which it grows. In the hazel-nut the husk is open at the point, shorter, or at least but little longer than the nut, and nearly smooth; while in the filbert (*Corylus tubulosa* of some writers), it is lengthened considerably beyond the nut, and covered more or less with glandular hairs; all degrees of intermediate structure may be found in the cultivated varieties. The *C. Americana* of botanists is not distinguishable even as a variety. There is a pretty purple-leaved kind in shrub-beries.

2. *C. rostrata*, the horned hazel-nut. In this the branches are quite free from glandular hispidity, the leaves are oblong, not cordate, doubly toothed, and acuminate, and the husks globular over the nuts, where they are extremely hispid, without ever being glandular; beyond the nuts the husks are contracted into a tube an inch or more long, and irregularly lacerated at the point. A very distinct species inhabiting the mountains of the Carolinas, where it rarely exceeds three or four feet in height. In gardens it is scarcely larger.

3. *C. colurna*, the Constantinople nut. A white-barked tree, twenty feet and more high, with an erect trunk and a dense spreading head. The leaves are shining, much less rugose than in the the hazel-nut, cordate, angular, serrated, acute or acuminate, slightly hairy on the under surface. The branches and all the other parts are destitute of glands; the husks are campanulate, deeply cut into narrow hairy rather falcate segments. The nuts are roundish and very

hard. A native of Asia Minor, and known from all the other garden species by its becoming a tree. It seldom produces its nuts in this climate.

Besides these, there are the *C. lacera* and *C. ferox*, two species found in the Himalaya mountains. Of these, the former, gathered in Kumaon, is hardly different from *C. columna*; the other, from Mount Sheopore, has narrow taper-pointed leaves, and excessively hard nuts, enclosed in a husk, with divaricating narrow spiny divisions.

CORYMB, a form of inflorescence approaching very nearly to the raceme. The raceme consists of an axis, upon which all the flowers are disposed upon footstalks of the same length; and hence its figure is more or less cylindrical. A corymb consists of an axis, the lowermost flowers on which have very long stalks, and the uppermost very short ones, so that the mass of inflorescence is an inverted cone, as in candytuft and many other cruciferous plants. The corymb is, in fact, an umbel with a lengthened axis.

From this word is derived the term *corymbose*, which is applied not only to flowers, but to any kind of branching in which the lowermost parts are very long and the uppermost very short, as is the case in most species of *Aster*.

CORYMBIFERÆ. [COMPOSITÆ.]

CORYPHA, a genus of East India palms, with gigantic fan-shaped leaves. Their flowers consist of a three-toothed calyx, three petals, six stamens, and a three-celled ovary. The fruit is composed of round one-seeded berries. Of the species two in particular deserve mention.

One, the Tara or Talliera, *Corypha talliera*, is an elegant stately species inhabiting Bengal. Its trunk is about thirty feet high, and as nearly as possible of equal thickness throughout. The leaves are in about eighty divisions, each six feet long by four inches broad, radiating from the point of a leaf-stalk from five to ten feet long, and covered with strong spines at its edge. Roxburgh describes the spadix as decompound, issuing in the month of February from the apex of the tree and centre of the leaves, forming an immense diffuse ovate panicle, of about twenty or more feet in height. The fruit is the size of a crab-apple, wrinkled, dark olive, or greenish-yellow. The leaves are used by the natives of India to write upon with their steel stiles, and for other purposes.

The other, the Tala or Talipat palm, *Corypha umbraculifera*, is a native of Ceylon, and similar in appearance; but its leaves are not so round as those of the Talliera, the divisions in the centre being shorter than those at the sides. The trunk grows sixty or seventy feet high; the leaves are fourteen feet broad and eighteen long, exclusive of this stalk, and they form a head about forty feet in diameter. Fans of enormous size are manufactured from this plant in Ceylon; the pith of its trunk furnishes a sort of flour from which bread is made; the leaves make excellent thatch, and are used for writing on like those of the Talliera.

CORYPHÆNA (Linnæus), a genus of fishes of the section Acanthopterygii and family Scombridæ.

The group of fishes formerly included under the head *Coryphæna* is now subdivided, and the subdivisions may be either termed subgenera of the genus *Coryphæna*, or the group may be looked upon as a sub-family, and the subdivisions as genera. The principal characters of this group are as follows:—Body elongated, compressed, covered with small scales; dorsal fin extending the whole length of the back (or nearly so); branchiostegous rays generally seven in number. These fishes have commonly a long anal fin, in some extending from the tail almost to the ventral. The tail is more or less forked, and the pectoral fin is usually arched above and pointed.

Considering *Coryphæna* as a genus, the following are the subgenera:—*Coryphæna* (proper), *Caranxomorus*, *Centrolophus*, *Astrodermus*, and *Pteraclis*.

The species to which the name *Coryphæna* is now restricted have the head much elevated, and the palate and jaws both furnished with teeth.

These fishes are very rapid in their motions, usually of large size, and they prey upon the flying-fish.

Coryphæna hippurus (Linn.), a species not uncommon in the Mediterranean, is about two feet in length, of a blueish lead colour above and pale yellow beneath. There are dark blue spots on the back and dorsal fin, and the under parts of the body are furnished with spots of a paler colour. The ventral fins are yellowish beneath and black above, and the anal fin is yellowish. The greatest depth of the body is about one-sixth of the whole length.

[*Coryphæna hippurus*.]

There are several other species of this genus, some of which are found in the Mediterranean, and very closely resemble the one just described.

The genus *Caranxomorus* (Lacépède) is closely allied to *Coryphæna* (proper); the species, however, may be distinguished by their having the head less elevated and the eye in a medial position; the dorsal fin is shallow and of equal height throughout: the tail is much forked.

Caranxomorus pelagicus is about nine or ten inches in length, of a blueish colour above and yellowish beneath; the dorsal and anal fins are of the same colour as the back of the fish, and have a whitish margin. It inhabits the Mediterranean.

The subgenus *Centrolophus* has already been noticed under the proper head. We will merely remark that the species of this genus which we have seen have the body shorter in proportion than in either of the two preceding genera, and of a somewhat elongate-oval form, the tail less forked, &c.

Subgenus *Astrodermus* (Bonnelli). But one species of this subgenus is known. The generic characters are:—head elevated, mouth but slightly cleft; dorsal fin extending nearly the whole length of the body; ventral fins very small, and placed on the throat; branchiostegous rays four.

Astrodermus Coryphænaoides (Cuv.) is from twelve to fifteen inches in length, and of a pale rose colour, with five or six longitudinal rows of round black spots; the dorsal and anal fins are blackish, and the pectoral and caudal fins are of a red hue. The most remarkable character of this fish, however, consists in the scales, which, instead of folding over each other in the usual way, are scattered over the body and head; they are very minute and serrated, and, under a lens resemble small stars. It inhabits the Mediterranean.

[*Astrodermus coryphænaoides*.]

Subgenus *Pteraclis* (Cuv.) The species of this group are

[*Pteraclis ocellatus*.]

remarkable for the immense size of the dorsal and anal fins, each of which springs from between two tiers of scales, which form a protection, and probably give strength to the basal portion of the fin-rays. These fins extend the whole length of the body; the head and teeth are nearly the same as in the true *Coryphænæ*; the scales are large.

Pteraclis ocellatus (Cuv.), is about four inches in length, and of a silvery hue; the pectoral and caudal fins are yellowish; the others are blueish grey, and the dorsal fin has a large blue spot near its highest part.

CORYPHÆUS. [CHORUS.]

CORYSTES, a genus of brachyurous or short-tailed crustaceans. Exterior *antennæ* longer than the body, setaceous, with two rows of cilia. *Jaw-feet* (pieds-machaires) having their third joint longer than the second, straight, terminated by an obtuse point, with a notch upon its internal border. *Eyes* rather distant, borne upon large peduncles, which are nearly cylindrical, and somewhat short. *Anterior feet* (chelæ) large, equal, twice as long as the body, and nearly cylindrical in the males; in the females, of about the length of the body, and compressed, especially towards the *hand* (manus). *The other feet* terminated by an elongated nail or claw, which is straight, pointed, and channelled longitudinally. *Carapace* oblong-oval, terminated by a rostrum anteriorly truncated and bordered posteriorly. The *regions* but slightly indicated, with the exception of the *cordial region*, the *branchial* or *lateral regions* being very much elongated.

M. Desmarest is of opinion that the natural relations of this crustacean approximate it to *Atelecyclus*, *Thia*, and *Leucosia*, of which M. Latreille forms his orbicular tribe (*Les Orbiculaires*). Dr. Leach, he adds, in his method, placed them near the first two of the above-mentioned genera, solely because they have the same number of abdominal articulations. The *Leucosia*, in which the number of those articulations is less considerable, are removed to a distance.

Example, *Corystes Cassivelaunus*, Leach; *Corystes dentata*, *Corystes dentatus*, *Corystes longimanus* of Latreille, *Cancer Cassivelaunus*, *Long-clawed Crab* of Pennant, *Cancer personatus* of Herbst, *Albunea dentata* of Fabricius.

Description.—Surface of carapace somewhat granulous, with two denticles between the eyes and three sharp points directed forwards on each side. The male has but five abdominal pieces; but, as M. Latreille observes, the vestiges

[*Corystes Cassivelaunus*, female.]

of the separation of the two others may be clearly remarked upon the intermediate or third piece, which is the largest of all.

Locality.—The coasts of England and France. The specimens figured by Pennant were dredged up from the deep near Holyhead and Red Wharf, Anglesey.

CORYTHAIX. [TOURACO.]

COS (Κῶς), an island in the Archipelago, the modern name of which is Stanco. It lies in the mouth of the gulf of Ceramus; its principal city, which was immediately opposite to Halicarnassus, was destroyed by a great earthquake in the Peloponnesian war. (Thucyd., viii., 41.) This city was, in very antient times, built on the other side of Cape Scandarium, which points up the gulf, and was called Astypalæa (Old-town). The new capital was not large, but well built and picturesquely situated. (Strabo, p. 657.)

Cos must have been colonized from Greece at a very early date. The inhabitants were Greeks even before Homer's time (*Iliad*, ii., 655 and 677; xiv., 2, 6, compare Strabo, pp. 573, 653); the mother-city of this Dorian colony was Epidaurus (Herod. vii., 99), as is indeed sufficiently shewn by the worship of Æsculapius, which prevailed in such a remarkable degree both at Epidaurus and in Cos. (Pausan., iii., 23, § 6.) There was a house of Asclepiadæ at Cos, to which Hippocrates was related, and we are told that he compiled his system of medicine from the tables of cures suspended in the Coan temple of Æsculapius, which was as celebrated in its way as the corresponding one at Epidaurus. (Strabo, pp. 373, 657.) A similarity of origin and religion induced the Coans to form a league with Halicarnassus, Cnidos, and the Rhodian Tripolis; and the confederacy celebrated the Triopian rites on a promontory of that name near Cnidos. (Herod., i., 144.) The constitution of Cos was in all probability originally the same with that of Epidaurus, namely, an aristocracy.

About the year 486 B.C. we find Cadmus, from Messana, reigning in this island by the appointment of the king of Persia; but after ruling a few years he restored the former constitution, and went with Epicharmus, the comic poet, who was a native of Cos, to Messana. (Müller, *Dorians*, i., 8, § 5, note 9.) It seems, however, that the island did not long enjoy the old form of government, for we find it just about this time under the authority of Artemisia. (Herod., vii., 99.) In later times a democracy was established, but it did not last long, for the violence of the demagogues forced those of the better sort to conspire together against them, and put down the republican constitution to which they owed their power. (Aristot. *Pol.*, v., 5.) The wines of Cos were famous throughout Greece. The climate is said to be delightful. (Leake's *Morea*, ii., 429.)

COSECANT, COSINE, &c. [TRIGONOMETRY.]

COSENZA. [CALABRIA.]

COSI, RIVER, rises in the Nepaul hills, near Catmandoo. At first it flows in a south-east direction to the town

[*Corystes Cassivelaunus*, male.]

of Chattra, in $26^{\circ} 53'$ N. lat., and $87^{\circ} 4'$ E. long.; turning then more to the south, it enters the district of Purneah, twenty miles to the north of Nauthpore. Its channel is in this part nearly two miles wide, but, except in the rainy season, presents little else than sand-banks and a succession of small islands. It passes the town of Nauthpore, still running nearly due south, and continues this course until at about 300 miles from its source it joins the Ganges in $25^{\circ} 25'$ N. lat., and $87^{\circ} 18'$ E. long.

CÖSLIN, **COESLIN**, or **KOESLIN**, a government circle in the eastern part of the Prussian province of Pomerania. It is bounded on the north by the Baltic, along whose shore it extends for above 100 miles; and on the east by West Prussia. It has an area of about 5428 miles (nearly twice the surface of Lincolnshire); is divided into nine minor circles, and contains 23 towns, 1 market-town, and 1142 villages. The surface is a level, occasionally broken by elevations, and rising into sand-hills near the Baltic. There are considerable woods and forests. Cöslin is watered by the Rega, Persante, Wipper, Stolpe, and numerous other streams; it has several lakes, but none of any considerable dimensions. Agriculture and grazing are the chief pursuits; to these must be added the manufacture of woollens, cottons, ribbons, leather, iron-ware, glass, paper, tobacco, &c. Amber is obtained along the whole coast. The population in 1817 was 244,515, of whom 239,000 were Protestants, 3336 Roman Catholics, and 1585 Jews. In 1831 the number of dwelling-houses was 36,322, and the population had increased to 323,450, and in 1834 to 329,298.

The stock in 1831 consisted of 43,687 horses, 129,681 heads of cattle, and 506,476 sheep and goats. The chief towns, besides Cöslin, the capital, are Stolpe, (6600 inhabitants), Colberg (6300), Rügenwalde (3400), Neustetten (3250), and Belgard (2800).

CÖSLIN (formerly Cholin), the capital of the government circle, and of the principality of Camin, is about five miles from the Baltic, and situated on the banks of the Niesenbecke, or Nesebach, which falls into the Lake of Jasmund. Cöslin lies at the foot of the Gollenberg, from which it is supplied with fresh water by means established in 1734, and is above a mile in length. Cöslin, which is situated in $54^{\circ} 13'$ N. lat., $16^{\circ} 12'$ E. long., is well built, surrounded with a wall, and has 4 gates, 3 suburbs, 1 market-place, 1 Lutheran church, 2 chapels, 690 houses, and about 6600 inhabitants: an increase of about 1700 since the year 1817. It was formerly the residence of the bishops of Camin, and is now the seat of provincial administration, and of the superior courts of judicature. It has a gymnasium, and a seminary for educating teachers. The population is chiefly engaged in navigation and commerce, and the manufacture of Russia leather, linens, woollens, and tobacco, as well as in dyeing, brewing, and fishing.

The spacious market-place contains a statue in freestone of Frederick William I., who had the town rebuilt in a regular style after its destruction by a dreadful conflagration on the 11th of October, 1718. On the Gollenberg is a monument commemorative of the Pomeranians who fell in the campaigns of 1813, 1814, and 1815. In the vicinity of Cöslin is the lake of Jasmund, on the banks of which the antient Jömsburg is said to have stood.

COSMO THE ELDER. [MEDICI.]

COSMO I., duke of Florence, and afterwards grand duke of Tuscany, was the son of Giovanni de' Medici, a celebrated condottiere of the fifteenth century, who was descended in a direct line from Lorenzo, the younger brother of the elder Cosmo. This line formed a collateral branch of the first house of Medici, and its members remained in a private station as wealthy citizens of Florence during the lives of Cosmo, Pietro, Lorenzo the Magnificent, and Leo X., taking little part in the civil broils which agitated the republic under the administration or influence of the elder branch. That branch became extinct by the death, in 1519, of Lorenzo de' Medici, duke of Urbino, the only legitimate grandson of Lorenzo the Magnificent, which was followed soon after by the death of his uncle, Pope Leo X. The duke of Urbino left an illegitimate son, Alessandro, who was made duke of Florence after the surrender of that city to the allied arms of Charles V. and of Pope Clement VII., in 1530. Alessandro was a profligate prince, and after several years of tyranny was murdered by his relative Lorenzino, who belonged to the junior branch of the Medici, in 1537. Upon perpetrating this murder, Lorenzino fled to Venice. The friends and councillors of the late duke, with Guicciar-

dini the historian at their head, proposed to appoint young Cosmo, of the younger branch of the Medici, as successor to Alessandro. Cosmo had against him a number of emigrants, some of the first families of Florence, who were hostile to the Medici, some through jealousy and rival ambition, and others because they wished to re-establish the republic. These emigrants were scattered about the different Italian cities, and were encouraged and supported by Pope Paul III., by Count Pepoli of Bologna, and others. They also relied on the protection of Francis I. of France, while Cosmo on his side was protected by the emperor Charles V., who acknowledged him as duke of Florence. The emigrants, having collected a few thousand men, invaded the Florentine territory, but were defeated by the troops of Cosmo at Montemurlo; and their leaders, Albizzi, Valori, and Filippo Strozzi, were taken prisoners and put to death. From that time Cosmo reigned absolute lord of Florence. He extinguished all remains of popular liberty, and he established a system of inquisitorial police by means of numerous informers. Persons accused of any designs against the government were tortured, and often put to death. He had agents also in various parts of Italy to watch the conduct of the Florentine emigrants, and in some instances to get rid of the most dangerous by assassination or poison, as in the case of Lorenzino, who was murdered at Venice by his order, in 1548. He effected a striking change in the manners of the Florentine people, who were before noted for their garrulity and lightness of conversation; they became henceforth taciturn and cautious, and spoke in half sentences. In other respects the administration of Cosmo was orderly and wise; he was attentive to business, and looked himself into all public affairs. He had considerable abilities; and if he rendered Florence and Tuscany entirely dependent on his will, he at the same time succeeded by consummate political skill in keeping his state independent of all foreign powers. He would be master at home: he freed his towns from the imperial garrisons, and resisted several attempts at encroachment from the court of Rome. He was the first to establish the unity and independence of Tuscany as a political state. He formed a native militia of the peasantry, well exercised and disciplined by experienced officers, so that at three days' notice he could collect 12,000 men in any particular point, besides the regular regiments which he kept in the towns. His finances were in good condition, and his treasury always well supplied with money.

Cosmo possessed at first the territories of the two republics of Florence and Pisa, the latter of which had been conquered by the Florentines before his time. In 1552 he added to his dominions, by an agreement with Jacopo d'Appiano, lord of Piombino, that principality, and also the island of Elba, when he fortified Porto Ferrajo, and improved its harbour. But a more important acquisition was that of Siena. That republic had survived the freedom of Florence, and had retained its independence under the protection of Charles V. But in 1552 civil factions having broken out among the citizens, who were excited also by the Florentine refugees, they drove away the Spanish garrison and admitted a French auxiliary force. In the following year Charles V. sent troops to reduce Siena, and Cosmo joined his forces to those of the emperor. Not succeeding that year, the emperor withdrew most of his troops; but at the beginning of 1554 Cosmo put together a larger force, attacked Siena, and occupied its territory. At the battle of Marciano, in August of that year, the Siennese and their French allies were defeated. After a long and obstinate resistance, in which the women took part, Siena was compelled by famine to surrender to Cosmo in April, 1555. The conditions were not harsh. Siena retained her municipal institutions under the protection of the emperor, who was to keep a garrison in it; but in the mean time Cosmo placed a garrison in it himself. All those citizens who chose to emigrate were at liberty to do so. A great many availed themselves of this stipulation, and retired to the town of Montalcino, where they kept up the semblance of a republic a little longer. Of 40,000 inhabitants which Siena had previous to the siege, only 6000 remained: the rest had either died or emigrated. In July, 1557, Cosmo received of Philip II., who had succeeded Charles V., the formal possession of Siena and its territory, exclusive of the coast near Monte Argentaro, with the ports of Orbitello, Telamone, Santo Stefano and Port' Ercole, which remained as a dependency of Spain, and were after-

wards annexed to the crown of Naples under the name of 'Stato de' Presidj.' The Siennese swore allegiance to Cosmo, who left to them their municipal laws and magistrates. In August, 1559, the small residue of the Siennese republic at Montalcino surrendered to Cosmo. All Tuscany was now, for the first time since the fall of the Roman empire, united under one government.

Cosmo married Leonora, the daughter of Don Pedro de Toledo, Spanish viceroy at Naples, and had five sons by her. Two of these, Giovanni, who had been made a cardinal, and Garzia, died suddenly towards the end of 1562, and their mother soon after followed them to the grave. A report was spread and readily believed by the numerous enemies of Cosmo, that Giovanni had been killed by his brother, after which Cosmo, in his wrath, had killed Garzia with his own hand. Alfieri has made this the subject of a tragedy. Probabilities, however, are against the truth of this assertion. (Botta, *Storia d'Italia*, lib. xii.) Cosmo's eldest son, Don Francesco, married the archduchess Joanna, daughter of the emperor Maximilian. In 1569 Pope Pius V., by a solemn bull dated 28th August, conferred upon Cosmo and his successors the title of grand duke of Tuscany, as superior to all dukes and princes, and inferior in rank only to kings. In the following year Cosmo went to Rome to receive his grand ducal crown from the hands of the pope. In his bull the pope set forth the merits of Cosmo towards the Holy See for having entered zealously into the war against the Turks, and founded the military order of St. Stephen, in imitation of that of St. John of Jerusalem, for having given assistance to the king of France against the Huguenots, and having prosecuted the heretics in his own dominions. The Inquisition was established in Tuscany; but Cosmo insisted upon having reports of its proceedings, and that its sentences should not have effect without his approbation. Several, however, suffered death for heresy or blasphemy; one of whom, Pietro Carnesecchi, a Florentine, who was very intimate with Cosmo, and had been repeatedly charged with heresy, being demanded by Pope Pius, was given up by the duke, taken to Rome, and there sentenced to death, and publicly executed in September, 1567.

Cosmo spent the latter years of his life chiefly at one or other of his villas, having entrusted the cares of administration to his son Francesco in 1564. Many things are said of the irregularity of his life in his old age, and his sons Francesco and Pietro were worse than their father in this particular. In 1570 he married Camilla Martelli, a private lady of Florence. Cosmo died 21st April, 1574, in the palace Pitti, which had become the residence of the grand dukes, and was succeeded by his son Francesco.

Cosmo, though an unprincipled man, was a very able statesman. In the general breaking up of most of the Italian independent states in the sixteenth century, he found means to create and consolidate a new and considerable principality, which has remained ever since independent, and he thus saved that fine country Tuscany from becoming a province of Spain, like Naples, Sicily, and Lombardy. He had the firmness to refuse Philip II.'s first offer of Siena as a fief of the Spanish crown, answering, that he was an independent sovereign, and would not make himself the vassal of another. He refused the crown of Corsica, which was offered to him by the insurgents in 1564, because it would have embroiled him with other powers and endangered his own states. Cosmo encouraged the arts and literature. He founded the Florentine Academy, the Academy del Disegno, or of the fine arts; and he restored the University of Pisa. He was the friend of several learned men, among others of Benedetto Varchi, a republican of the old school, who wrote his history under his patronage, and Cosmo was not offended at the freedom of his sentiments. The Medici dynasty founded by Cosmo became extinct in 1737 by the death of the grand duke Gian Gastone. He was succeeded in his sovereignty by Francis duke of Lorraine, the husband of Maria Theresa of Austria. (Botta, *Storia d'Italia*; Galluzzi, *Storia del Gran Ducato di Toscana*; Ammirato, *Istorie Fiorentine*, &c.)

COSMO'GONY, in the proper sense of the term, is the science of the creation of the world. As the creation of the world was not observed by man, and as it is not possible for man to observe the creation of a world, so cosmogony cannot be a science founded on direct experience, but must necessarily be a philosophical science. But though cosmogony belongs to the department of philo-

sophy, yet, as it requires an accumulation of facts and observations to rest on, it must still be classed under the division of practical philosophy. The ancients not possessing these facts and observations, cosmogony has only become a science in modern times. The German philosopher Kant has denied the capacity of the human mind to entertain this science.

The doctrine of the creation of the world may be considered in three ways: the inquirer either confines himself to the creation of our earth, and reduces cosmogony to geognosy, geogony, speculative geology, and oryctognosy, (which latter is a science of itself,) or he may merely investigate the creation of celestial bodies, or he may extend his researches to the origin of creative power, and the creation of the elements of matter.

The first of these modes of investigation is pure cosmogony; the second is a union of cosmogony with dynamogony, physiogoy, and speculative chemistry and physics. The ancients speculated or dogmatized in both these divisions of the science. Anaximander considered the sun to be only a little larger than the Peloponnesus; Leucippus and Democritus asserted the existence of different kinds of atoms, and that the soul also was composed of atoms. Heraclitus supposed heat to be the primitive element and the omnipotent power. Plato, besides an eternal supreme intelligence, believed in the existence of a primitive and eternal matter, which was divided by the intelligence into the four recognised elements, and vivified by a soul, making the world an animal, with the stars as limbs. Aristotle admitted the elements of Plato, but denied the soul; substituting in its stead individual souls. Epicurus supposed an infinite variety of atoms, which being in constant motion, form bodies by accidentally coming into contact with each other. Empedocles, the most enlightened of these ancients peculators, believed that the four elements were not originally individually developed, but were in a state of amalgamation; that, after the development of the elements, enmity (repulsion) and friendship (attraction) became inherent properties of them, and that the soul was formed of these elements, fire predominating in it. Pythagoras, in consequence of his numeric system, taught a central heat, the existence of ten spheres, the sun, moon, five visible planets, the earth, an opposite earth, and the stars; also a music of the spheres, produced by the harmonic movements of the heavenly bodies. The new Platonic school of Alexandria, under Ammonius, Plotinus and Iamblichus, believed every thing to be an emanation or effusion from a supreme power.

Modern cosmogonists may be divided into two classes; first the dogmatists, as Buffon in his *Histoire Naturelle*, Wolff in his *Cosmologia*, Maupertuis in the *Essai de Cosmologie*, Lambert in the *Kosmologische Briefe*, Dalberg in the *Betrachtungen über Universum*, Berger in his *Philosophische Darstellung des Weltalls*, Des Cartes, *Opera Omnia*, lately edited by Victor Cousin; and Holbach in the *Système* de la Nature*. Secondly, the critical cosmogonists, who conduct their inquiries according to the principles of Kant, as developed in his *Allgemeine Naturgeschichte*, und *Theorie des Himmels*; and in detached parts of the philosophical systems of Schelling, Hegel, Herbart, and in the *Naturphilosophie* of Oken, which contains a complete system of cosmogony, dynamology and physiogoy and in a little work of John Müller, entitled *Ueber die Entstehung der Welt aus Nichts*, of which, as it is the latest German publication on the subject, we give an abstract.

Müller, after premising that *nothing* cannot be productive of anything, admits the existence of an original governing power, possessed of omnipresence and consciousness, consequently of omnipotence and universal benevolence, but unembodied. From eternity this power designed the formation of the world, which could only be effected in one of two modes, either in a pantheistical or spiritual mode. As in the abstract, or in the world as it is objectively, there exist no limited magnitudes or quantities, but only the infinitely great or infinitely small, out of the amalgamation of which, things limited or measurable proceed, such a power, as before described, could create the world either with his own entire and undivided power, bestowing on it an all-pervading soul, contradistinguished from individual souls,

* This celebrated work has been ascribed to Mirabaud and La Grange, but was in fact written by Baron Holbach, when residing in the house of La Grange.

which is the doctrine of Pantheism; or the intelligence, has parted with an infinitely small portion of its power, which of itself created the world: this is the doctrine of Spiritualism. This last process this writer considers to have been the case, and asserts that the infinitely small portions of power which the intelligence parted with are what we call time. The continued existence of time not only shows the continual existence of the power predicated, but also disproves Pantheism. The act of parting with power or forces, frequently observable in organic chemistry, is apparent to sensible creatures in space, and the act of parting with time in indefinite space. If an eternity be allowed to an infinitely small portion of power for growth or formation, it must become definite: an eternity of passed time is equal to existent power. A point being given, as a centre in indefinite space, a nebula is immediately formed by this power, and, according to Müller, the action of this original power is three-fold, viz. by attraction, repulsion, and a power indifferent to both, which is quiescent, and what we call original matter, or physis, or hyle, or æther; and there being a constant preponderance of attraction to the centre, the æther is attracted or compressed towards it. Besides this, the nebula possesses a rotatory motion, of which even the smallest parts partake, and assume the form of a vortex or atom. Every vortex possesses attraction, repulsion, æther, and, as it turns upon its axis, a rotatory motion. Either the vortex has just the degree of velocity in its rotation, which, added to the constantly decreasing repulsion, is equal to the attraction, and then the vortex is fluid, and assumes the form of drops; or there is a preponderance of rotation, when the vortex becomes gaseous; or there is too little rotatory motion, in which case the vortex concentrates itself into a substance, and throws off particles, which move round it as a centre and together form a system: the vortex then is solid or fixed. The vortices are atoms; the rotatory motion when increased is heat; when diminished is cold.

Every vortex or atom, as soon as it has positively adopted one of the three forms, fluid, gaseous, or solid, is an element, and is unchangeable. There is in the universe an infinite number of elements, which differ in their inherent powers according to the different quantities of æther which they contain. These elements may be denominated metals, and of them oxygen, as containing the least attraction, may be overcome by any of the others; when thus overcome the process is called oxidation. The more solid and dense elements accumulate round a heavenly body in the progress of its formation, while the lighter and finer elements settle on its surface; thus oxygen is everywhere in our atmosphere. Out of these materials an original central heavenly body formed itself. According to mathematical laws, rotation must have increased in proportion as the condensation augmented, and consequently the more dense the vortices or atoms became, the greater was their rotatory motion, which produced increase of heat, and consequently oxidation of oxygen, and fire, and the throwing off, from the equator of the original central heavenly body, masses of burning and melting metals; in proof of which it has been calculated that our earth would throw off masses from the equator if it revolved upon its axis 121 times quicker than a cannon ball flies, and that these fragments would move round the earth as its satellites.

Applying this process to the original central heavenly body, we arrive at the result that the twenty millions of stars of the Milky Way are the first regular metallic fragments thrown off by that body, while the few thousands of stars, visible to the eye, and the sun, are the later and irregularly-ejected portions, all of which still burn, and consequently give light and heat to their respective planetary systems. The planets are probably thrown-off portions of the sun, and, in consequence of their now limited size, have long since cooled, grown habitable, and become satellites of the sun. He considers comets to be masses of water, or of vapour arising from water.

In thus giving an account of this system of cosmogony, it is almost unnecessary to observe that it is merely presented here to show what kind of speculations the term cosmogony, as at present understood, includes.

COSMOGRAPHY (*κοσμογραφία*), the description of the system of the world, from the two Greek words *γράφω*, to write, and *κόσμος*, which signifies the world, or the universe, considered as a system of order. Cosmography, strictly limited, has nothing to do either with the origin and creation of things, which is the subject of cosmogony,

nor with the metaphysical philosophy of the constitution of things, which is cosmology. It is merely the description of the system of the material world, as it is, or as it appears to our senses. Nor does it comprehend any examination of the separate parts of the system, except in so far as each is connected with the whole, any more than the description of a machine comprehends any account of the wood or iron or other material of which it may be fabricated. Yet this distinction has been sometimes neglected. There is a work, for instance, by Paul Merula, under the title of '*Cosmographia Generalis*,' fol. Amst. 1621, which is in the greater part merely a description of the different countries of the earth, or in other words a treatise of geography. In like manner, the English work of Dr. Heylin, first published in 1622 under the title of '*Microcosmos*,' and afterwards under that of his '*Cosmography*,' is merely a compilation of geography and history. The word cosmography may perhaps legitimately admit of some variety of acceptation, in regard to the extent of what is to be considered the system of the world, or of the universe. Of the universe absolutely we can of course predicate nothing; but as anything may be called the whole which can be regarded as complete in itself, so the word universe is applied sometimes to this globe alone, which in one sense is the universe to us, and sometimes to that solar system of which our globe is one of the parts. But the term cosmography might also, without impropriety, be used as meaning a view or description of any separate portion of the entire universe still more extensive than the solar system.

COSNE, a town in France, in the department of Nièvre, on the right or east bank of the Loire, just at the junction of the little river Novain, 102 miles in a straight line S. by E. of Paris, or 110 miles by the road through Fontainebleau and Montargis, 47° 24' N. lat. and 2° 56' E. long. Cosne is a town of considerable antiquity, and appears in the '*Itinerary of Antoninus*,' under the name of *Condate*, a Celtic word, denoting 'a corner,' and applied commonly to places situated in the angle formed by the junction of two streams. (D'Anville.) In the records of the middle ages the town is mentioned by the name of *Condida*.

Cosne is situated in a country rich in iron ore, and is one of the principal towns for the manufacture and sale of iron goods. Knives and scissars are mentioned by Expilly (1762) as the principal articles of manufacture: since his time the manufacture of anchors of the largest size, cannonballs, and iron work for ships or for warlike purposes, has grown to great importance; that of cutlery is still carried on. There are several cooperages; gloves are also made. The town is situated at the foot of a plateau or table land; it is neat and well laid out, though in the older part the streets are narrow. There is a handsome theatre, and there are several good inns, and a public walk on the bank of the Novain. The population in 1832 was 5123 for the town, or 5987 for the whole commune.

Before the revolution this town contained several monastic establishments. It has now a court of justice (*Tribunal Civil*, or *Tribunal de Première Instance*) the courtroom of which is handsome. It is the capital of an arrondissement, occupying the north-west extremity of the department, and containing (in 1832) a population of 66,850; there are in it many iron works.

COSSACKS, a people inhabiting those parts of the Russian empire which border on the northern dominions of Turkey, Poland, and Tartary, as well as the southern parts of Siberia. Both the name and origin of this singular people are involved in uncertainty: the former they appear to derive from the Tartar word *Kasak* or *Kaisaks*, signifying light-armed mercenary horsemen. They were for a long time known by the Caucasian appellation of *Tsherkassi* (or *Circassians*), and to this day call their capital *Tsherkask*. As to descent they appear to be of the native Russian race, intermixed with Tartars, Calmucks, and Gipsies, an origin of which their language and religious practices leave scarcely a doubt. Russian forms the groundwork of their dialect; in military matters it is corrupted with Turkish, and in legal affairs with Polish words. The first mention made of them is about the time of the downfall of the Tartar dominion in Russia. As a united people they seem to have sprung up in Southern Russia out of the remains of that dominion. There, amalgamating with the natives and fugitives from all parts, they gradually extended their power to the Bug and Dniester, building towns and villages, and

waging war against the Turks and Tartars. For the purpose of defence they were classed into the married and unmarried, of whom the latter devoted themselves exclusively to the profession of arms, warfare, and plunder. They fortified themselves in their head-quarters on an island of the Dnieper called Korlitzkoi-Ostrof, from three streams on the right bank of the river. They gave this settlement the name of Setch or Setcha, while they themselves, from their local position, bore that of Zaporoghes. The married men lived at some distance from the spot, in villages, between the Dnieper and Bug. At this period, the middle of the fifteenth century, the Cossacks do not appear to have had any regular government; but when the emergency arose they elected a chief, whose authority terminated with the cessation of the emergency. They furnished troops at their own cost to the Voivodes, established in the Ukraine by the Lithuanian princes.

Towards the commencement of the sixteenth century, a kind of military republic, governed by elective chiefs, was established among these rude tribes by a Russian of low origin but great courage. They had not at this time assumed the name of Cossacks, nor were they known by it in history until the year 1516, when they began to act a conspicuous part in Polish affairs.

In 1575 Yermak or Yermolai-Timofief, a Cossack of note, exasperated by Muscovite oppressors, who had subjugated the Cossacks of the Don in 1549, deserted his quarters on that river, directed his flight along on the Volga, destroyed the Khannate of Kutchum, and then established his followers in the south of Siberia; hence arose the nation of the Siberian Cossacks. In 1580 the Cossacks are first mentioned as distributed into 'Pulks,' or regiments, on the occasion of their defending Tshegrin, in Poland, against the Tartars, under the command of Ostafy Dakiewitsh. Ten years before, upon their return from a victorious campaign against the Turks, as auxiliaries of Ivan IV. of Muscovy, they founded New Tsherkaskoi on the right bank of the Don. They next accepted the protection of Poland, and, in 1592, Stephen Bathory, the king of that country, divided their forces into 10 regiments of infantry and 2000 horsemen, the latter receiving pay out of a tax levied upon the rebel peasantry. He also appointed an Attaman or Hetman as chief over them, and his successors endeavoured on all occasions to interpose them as a barrier against the incursions of the Tartars of the Crimea and Budjak, and hence arose their implacable enmity to the Turks and Tartars. The encroachments made on their rights by Sigismund III. gave rise to a long series of contentions, which ended by Chmielnitzki, their Attaman, seeking the protection of Russia in 1654. At this time their force consisted of 15 regiments, 37,549 men strong, besides some hundreds of horsemen. They remained faithful to Russia until the year 1708, when their Attaman Bulavine went over to Charles XII. of Sweden; but he was not followed by the Zaporoghes of the Dnieper. They again became subject to Russia, and in Peter the Great's time we find him disbanding the Cossack regiments in his service, and re-modelling them. This harsh measure induced them to throw themselves into the arms of the Khan of the Crimea; but they speedily became disgusted with their new masters, and successfully sued for pardon of the Empress Anne, who allowed them to settle again on the Russian territory. Here they remained until they provoked the Empress Catherine by their turbulences, who ordered their Setcha to be destroyed, the inhabitants to be scattered, and the Cossacks of the Ukraine to be formed into regiments of hussars. The Zaporoghes were banished to the peninsula of Taman, and from these exiles sprang the present Cossacks of the Euxine. In later times the Cossacks have been allowed the tranquil enjoyment of their settlements, and have been exempted from taxation on condition of furnishing certain contingents to their Russian masters. In 1831 the emperor Nicholas re-established the regiments of the Ukraine under the denomination of the Cossacks of Little Russia. At present their troops are wholly composed of cavalry, and are thus distributed:—

	Imperial Guards.	Men.
Cossacks of the Don	1 regt., 10 squads.	1200
" Euxine	1 . 2	240
" Ural	1 . —	120
" Attaman	1 . 10	1200
		2760

	Of the Line.		Men
Brought forward			2,760
Cossacks of the Don	70	350	42,400
" Euxine	21	195	12,600
" Little Russia	18	90	12,800
" Siberia	30	150	18,000
" Ural	10	50	6000
" Upper Terek	3	15	1800
" Lower do.	3	15	1800
" Volga	3	15	1800
" Bob	3	15	1800
	164	917	101,760

Besides two batteries of horse artillery of the Don. One-half of this force is always kept in readiness for service; the other forms the reserve: the whole however may be called out at once, and the strength of the regiments may be augmented at the emperor's mandate. Every Cossack, between the ages of 18 and 40, is liable to perform military duty. Each regiment is drawn from one or more stanitzas or districts, and every Cossack is required to supply himself with a horse, arms, and equipments. The young are called out first, and men of advanced age are retained as the reserve, unless they volunteer for field duty. The recruits are more favoured than any others in the Russian service; they are neither chained on the march to head-quarters nor subject to bodily examination. In time of war the period of service is unlimited; in time of peace it is confined to three years. The Cossacks of the Euxine, who are attached to the corps stationed in the regions of the Caucasus and Georgia, are almost invariably in active service. There is no longer a local Attaman; Count Razumoufsky, the last chief of the Ukraine, was dismissed by Catherine II., and the post of Attaman of the Don has been suppressed by the present emperor. The nominal dignity of Attaman is vested in the heir-apparent to the Russian crown. The Cossack receives no pay but when in the field or on the Russian frontier. The dress of the soldiery is a short vest in the Polish style, large trousers of deep blue, and a black sheepskin cap. Their arms consist of a long spear, sabre, musket, pair of pistols, and a whip with a leather thong, called a natraika, which they apply to their enemy's as well as their charger's back. They are mostly members of the Russo-Greek church, enjoy their own independent constitution, and are a purely military people. The only authority that we possess as to their actual numbers is a return of the year 1749, when the number of hearths was 118,459, and of male persons 955,228. In the beginning of the present century Archenholtz affirmed the number of males fit for duty to be 700,000.

COSSEIR, a town of Egypt on the Red Sea, in 26° 7' N. lat., and 34° 21' E. long. It is about 160 miles east of Kenneh on the Nile in Upper Egypt. The caravans which trade with Arabia, proceed from Kenneh to Cosseir, through the sandy desert east of the Nile; the track, about two thirds of the way from Kenneh, crosses a rocky ridge, on the east side of which a valley opens, leading to the coast of the Red Sea where Cosseir is situated. Several springs or wells are found on this track. The Ataoni Arabs live in this part of the country, and escort the caravans between Kenneh and Cosseir. Cosseir is only an open road, but it is the chief medium of communication between Egypt and Arabia, especially since Mehemet Ali Pacha has become master of the Hedjaz in the latter country. From Cosseir vessels cross over to Jidda, the port of Mecca, or to Yambo, the port of Medina. Cosseir is a small assemblage of poor dwellings, the resident population of which amounts to only about 1000; but there are large storehouses where the caravans deposit their goods. (See the Chart of the Red Sea, north of Jidda, 1836, published from the survey of Maresby and Carless.)

COSSIMBAZAR. [MOORSHEDEBADA.]

CO'SSONUS (Clairville), a genus of Coleopterous insects, of the family Curculionidæ. Technical characters:—Antennæ short, rather thick; funiculus seven-jointed, the basal joints longer than the following; club large, and of an oval form; rostrum rather long, thickened at the apex; thorax truncated before and behind, and somewhat depressed above; elytra elongate, moderately convex above, and covering the abdomen; tibiæ dilated towards the apex, where there is a large hook; tarsi rather slender, the penultimate joint bilobed.

About seventeen species of this genus are known, of which Schoenherr selects *Cossus linearis* as the type. This species is not uncommon in England, and has been found in boleti and in old trees: it is about a quarter of an inch in length, and of a narrow elongated form, and black or brown colour; the elytra are punctate-striated. *Cossus tardii* is another British species, which closely resembles the last, but is of a larger size, being nearly half an inch in length.

COSSUS (Fabricius), a genus of moths—section, Lepidoptera Nocturna—family, Hepialidæ (Stephens). Technical characters: antennæ long, rather slender, furnished on the inner edge with a series of transverse elevated ridges (which, when viewed from the side, resemble the teeth of a saw); two distinct palpi, thickly clothed with scales, and each three-jointed; head very small; upper wings longer and larger than the lower; body large.

Larva lignivorous. Pupa enclosed in a cocoon.

Cossus ligniperda (Fab.) is one of the largest of the British moths, measuring, from tip to tip of the wings when expanded, from three to three and three quarter inches. It is of a grey colour: the upper wings are mottled with white, and adorned with numerous irregular black lines; the under wings are almost of a uniform brownish-ash colour; the anterior part of the thorax is of a buff colour, and there is a transverse dark mark towards the posterior part; the body is of a dark brownish-grey colour, with rings of a silver-like hue.

The larva or caterpillar is about three inches in length when full-grown, and of a yellowish colour; the upper part of the body is pink, the head is black, and the first segment of the body (or that joining the head) has two irregular black patches above.

This caterpillar emits a very strong and disagreeable odour, and if touched with the hands, the scent cannot be discharged from them for some considerable time, although they may be frequently washed. It resides in and feeds upon the wood of the poplar, oak, and aspen; but old pollard willows appear to be its most favourite haunts. These we frequently see perforated with numerous oval holes, large enough to admit the finger, and when the caterpillars are abundant, the trees attacked eventually fall a sacrifice to their ravages. It is three years before attaining maturity, at which time it encloses itself in a tough cocoon, formed of pieces of wood joined together by a glutinous web.

The moth is common in various parts of the south of England, and is often called the *goat-moth*, a name which has probably been applied from the property of emitting a disagreeable odour having been transferred from the caterpillar to the moth.

A detailed history of the *Cossus ligniperda* will be found in the 'Mémoires pour servir à l'Histoire des Insectes,' by De Geer; and for its anatomy we refer our readers to the 'Recherches sur l'Anatomie et les Métamorphoses de différentes Espèces d'Insectes,' by L. L. Lyonet. This latter author has also published a substantial quarto work, with numerous beautiful plates, engraved and drawn by himself, which is entirely devoted to the anatomy of the caterpillar above mentioned. This work, which was the labour of years, must ever stand as a monument of the great skill and perseverance of its author, who boasts of having destroyed but one caterpillar for its completion. It is entitled, 'Traité Anatomique de la Chenille qui ronge le Bois de Saule,' &c.

COSSYPHUS (Olivier), a genus of Coleopterous insects, of the section Heteromera, and subsection Taxicornes. The principal character of this genus consists in the dilated and flattened sides to the thorax and elytra—a structure also found in many of the Nitidulæ and in the Cassidæ. These insects, if it were not for the dilated portions of the thorax and elytra, would be of a long and narrow form, but with these parts they present an oval outline. The thorax is nearly semicircular, and its dilated margins, as well as those of the elytra, are semitransparent. The antennæ are eleven-jointed; the four last joints are considerably thicker than the preceding, and rather flattened; the terminal joint of the maxillary palpus is dilated, and of a somewhat triangular form; the head is completely hidden by the anterior part of the thorax.

These insects inhabit the south of Europe, and the northern parts of Africa and India. About ten species are known.

Cossyphus Hoffmanseggii is nearly half an inch in length,

and of a dark-brown colour; the parts of the thorax and elytra which extend beyond the insect itself are of a paler hue. It is difficult to give an accurate idea of this curious insect, which appears as if it were an ordinary shaped beetle pressed against the under side of a little oval scale of wax, so that its impression is distinctly visible above, being convex, whereas the scale itself is concave.

The present genus, with two others (*Helæus* and *Nilio*), form, according to Latreille, the second tribe of the family Taxicornes, and are included under the head *Cossyphenes*.

COSTA-RICA. [CENTRAL AMERICA.]

COSTANTINA or **COSTANTINAH**, as the Arabs pronounce it, the ancient Cirta, once the capital of Numidia, is the capital of the east division of Algiers, and the largest town of the whole state next to Algiers itself. It stands on a steep rocky hill, round three sides of the base of which flows the river Rummel, which is the principal affluent of the Wad-el-Kebeer, the ancient Ampsaga. The rocky peninsula on which the town is built is joined on the south-west side by a neck of land to the adjacent country. The country around Costantina is a high terrace between the lesser or maritime Atlas to the north, and the higher or central chain to the south. The Wad-el-Kebeer, and the Seiboos, or river of Bona, both flowing northwards into the Mediterranean, and the Sirkah or Abeadh river, which flows southward into the Melgimarsh, have their sources in this high land. The central Atlas range which runs from west to east through the province of Titterie, on entering the borders of the province of Costantina, south of the Jurjura mountains, which belong properly to the Maritime Atlas, inclines to the south-east, forming the groups called Vanougah, I-aite, Sellim, and Mustewah; it then joins the extensive group called Jebel Aures, which is directly south of Costantina, beyond which it continues in an east direction, forming the mountains of Tipasa, in which the Mejerdah has its sources, and which extend into the kingdom of Tunis; from the Jebel Aures, however, an offset is detached to the north-east, separating the waters of the terrace of Costantina which flow northwards into the Wad-el-Kebeer and the Seiboos from those which flow eastward into the Mejerdah or Bagradas. East of this ridge, and towards the sources of the Mejerdah, are the plains of Myskianah, renowned for their fertility; they belong to the province of Costantina, and border on Tunis.

Among the towns are Tipsa or Tipasa, Gella, a frontier town and garrison near the Mejerdah, which is here called Serrat, and further north, in the valley of the Sujeras, an affluent of the Mejerdah, is Tiffesh, the ancient Thebestis. This part of the country has been lately visited from the side of Tunis by Sir Greville Temple, *Excursions in the Mediterranean*, 1835.

The road from Algiers to Costantina, after crossing the river Isser, passes over the southern skirts of Mount Jurjura, and then enters a narrow defile called by the Arabs Beeban, or 'the gates,' and by the Turks, Dammer Capi or the 'iron-gates,' which is cut through perpendicular rocks. Six miles east of it is another difficult pass called Accaba, or 'the ascent,' being over a ridge which seems to connect the Maritime Atlas with the more south or central range. The road lies over a high narrow ledge with precipices on each side. Descending to the east, the road enters the fertile plain or terrace of Mayanah. In this region the Boosellam, an affluent of the Boojeyah river, has its source. Proceeding to the east is Zammorah, known for its olive plantations, and farther on the road to Costantina is Seteef, the Colonia Sitifensis, of which Shaw describes some remains. The town stood on a hill facing the south, near the Boosellam. In the plains south of Seteef, which consist chiefly of pasture land, dwell several Arab tribes, one of which, the Beni Ammer, have a very bad character. About twenty miles south-east of Seteef, are Taggah and Zainah, in a fine open country at the north base of the Jebel Mustewah. At Zainah, Shaw saw the remains of a triumphal arch in honour of Severus, and other antiquities. He thinks that Zainah is probably the ancient Zama. About fifteen miles east of Zainah is Medrashem, in a plain on the skirts of the Jebel Aures, with a handsome sepulchral monument supported by pillars. On the opposite or south side of the Atlas ridge lies the valley of the Shatt or Shott, a marsh into which several streams empty themselves, and which is again separated by another more southern ridge from the Zaab, or valley of the Adje-dee river, where the Biscareens dwell. In the valley of the Shatt are the ruins of Thu-

buna, now called Thubna. This part of the country is inhabited by several powerful Berber tribes.

Returning to the latitude of Costantina, there seems to be to the east of Seteef a transverse ridge of high land which divides the plains of Seteef from the terrace of Costantina, which appears to be higher, and which extends nearly 80 miles towards the east, where it is bounded by the ridge already mentioned, which divides the sources of the Seiboos from those of the Mejerdah. This region, which is very elevated, consists of fertile plains with hills upon them, and to the south it blends itself with the valleys which lie within the extensive group of the Jebel Auress. The country is partly tilled and sown with corn, or planted with olive and other fruit-trees, and partly left for pasture. It also produces rice, hemp, flax, and tobacco. Between the Jebel Auress and the town of Costantina, is a mountain called Ziganeah, apparently a projection of the Auress, and at the foot of which lies Physgèah, formerly a Roman colony, with an abundant fountain and reservoir, the water of which was formerly carried to Costantina by an aqueduct. Physgèah is about fifteen miles south of Costantina. To the north, the terrace of Costantina opens towards the coast of the Mediterranean, by two valleys or gorges formed through the ridge of the lesser or maritime Atlas, one by the course of the Wad-el-Kebeer, almost direct north from Costantina, and the other by the Seiboos in a north-east direction to the gulf of Bona. The mouth of the Wad-el-Kebeer, which is the nearest point of the sea to Costantina, is about forty-eight miles distant. The distance from Costantina to Bona is about 100 miles, and from Costantina to Algiers twice as much. About half way between Costantina and Bona is Gelma, or Guelma, where are some Roman remains, and which seems to be a strong position, commanding the entrance into the plain of Costantina. The French expedition under Marshal Clausel, in November 1836, assembled at Bona to the number of about 8,000 men, whence they marched upon Costantina by the left or west bank of the Seiboos; they found great difficulty in passing their cannon and waggons over that part of the lesser Atlas which lay in their way, and in crossing the swollen torrents. When they arrived on the high terrace of Costantina, they experienced a heavy fall of snow, which lasted several days, and by the severe cold disabled or killed a large part of the army. Having come in sight of Costantina, they found the place defended by Arabs and Kabyles, with some cannon on the walls, and too strong to be carried without a regular siege, for which they were not prepared. Accordingly they were obliged to march back to Bona, much annoyed by the Arabs during the first day's retreat. They left a body of troops in the position of Guelma, and a new expedition against Costantina is talked of. (Marshal Clausel's *dispatch* after his return to Bona, as given in the *Times* and other newspapers of the 19th December, 1836.) Costantina is described as a large city, larger than Algiers in appearance, though Shaw gives it only a good mile in circumference; the houses have sloping roofs covered with tiles, a circumstance which of itself denotes the difference of its climate from that of the sea coast. The population is supposed to be between 30,000 and 40,000. It was the ancient Cirta (probably Carth, 'the city'), the residence of Massinissa and Jugurtha; it afterwards became a Roman colony in the time of Cæsar, Cirta Sittianorum, and the head town of Numidia Propria, until Constantine gave it his own name. A Roman bridge, a triumphal arch, several cisterns, a handsome gate, and other remains of antiquity, have been described by Shaw, who is still the best, we had almost said the only good, authority for this fine and extensive region. (See also *Nachrichten und Bemerkungen, über den Algierschen Staat*, Altona, 1798, and Poiret, *Voyage en Barbarie*, in 1785-6.) The Beylik of Costantina occupies nearly the one half of the whole Regency of Algiers, and most of it, especially its south part, is still unknown to Europeans. It is impossible to guess at its population; but by reckoning the numerous tribes scattered over its surface, it must be considerable. Under the Romans it formed part of Mauritania. After the invasion of the Arabs, and the subsequent breaking up of the power of the eastern Caliphs, it formed a separate kingdom, nominally subject to the Fatimites. It had wars with the kings or sultans of Tunis, and about 1520 was subjected by Khair Eddin Barbarossa, from which time it has remained annexed to the Regency of Algiers. The Bey of Costantina was the most powerful

of the three Beys among whom the territory of the Regency was divided. His sway however extended only over the open country around his capital, and some other places where he kept garrisons, such as Bona, Boojeyah, and a few more points along the coast or towards the frontiers of Tunis. All the mountainous parts are inhabited by tribes of Arabs and Berbers, who never acknowledged the sovereignty of the Turks, and only pay tribute when obliged to do so by force. Ahmed, the present Bey of Costantina, has remained in his capital as an independent Bey of the country ever since the French took possession of Algiers. For the maritime towns of the province of Costantina, see ALGIERS and BONA.

COSTARD, GEORGE, born about 1710, M.A. of Wadham College, Oxford (of which he afterwards became fellow and tutor), in 1733, rector of Twickenham, in 1764, at which place he died, January 10, 1782. He was respectable, both as a classical and oriental scholar, and as a mathematician; an account of his miscellaneous writings may be found in Kippis's 'Biographia Britannica.' He was the editor of the second edition of Hyde's work on the 'History of the Persians;' but his claim to notice is principally derived from his 'History of Astronomy,' &c. London, 1757. This work appears to have obtained more reputation abroad than at home, where it certainly is not appreciated. It is a history of the rise and progress of the fundamental doctrines of astronomy, mixed up with an elementary account of them, in order of discovery, and accessible to a student who can use a common globe, and has the first rudiments of geometry. In all matters of ancient and oriental learning, Costard frequently cites the passage and always the reference, which gives his work a lasting value.

COSTER, LAWRENCE, or **LAURENT JANSZON**, a native of Haarlem in Holland, whom the Dutch consider as the true inventor of the art of printing. He is believed to have been born at Haarlem about the year 1370; and in after-life filled successively several minor offices in his native town, as sacristan, churchwarden, and treasurer of the church of St. Bavon. His name appears in the registers of that church in the years 1423, 1426, 1432, and 1433. The time of his death is not mentioned. The following is the account given by Hadrian Junius, a Dutch writer of the sixteenth century, of Coster's claim to the discovery of printing. Junius's 'Batavia' was published in 1588, but the passage, the substance of which we here give, is believed from the context to have been written twenty years before. He relates, that about 128 years before he wrote, this Lawrence Coster resided in a large house, situated opposite the royal palace at Haarlem, which was still standing. That Coster, during his afternoon walks in the vicinity of the city, began by amusing himself with cutting letters out of the bark of the beech-tree; and with these, one after another, the letters being inverted, he printed small sentences for the instruction of his grandchildren. That being a man of genius and research, and finding the ink then commonly used apt to spread, he afterwards discovered, with the assistance of his son-in-law, Thomas the son of Peter (who, he tells us, left four children, most of whom afterwards enjoyed high offices in the state), a more glutinous kind of ink, with which he succeeded in printing entire pages, with cuts and characters. That he, Junius, had seen specimens of this kind, printed on one side of the paper only, in a book entitled 'Speculum Nostræ Salutis,' written by an anonymous writer in the Dutch language; the blank pages being pasted together, that the leaves might turn over, like those of an ordinary book, without showing the vacancies. That, afterwards, Coster made his letters of lead instead of wood; and lastly of pewter, finding that metal harder, and consequently more proper for the purpose; and that various drinking cups, made of the remains of this old type, were still preserved in the aforesaid house, where, but a few years before, Coster's great-nephew, or great-grandson, Gerard Thomas, had died at an advanced age. That the invention in question soon meeting with encouragement, it became necessary to augment the number of hands employed; which circumstance proved the first cause of disaster to the new establishment; for that one of the workmen, named John (whom Junius suspects might be Fust, for he does not absolutely accuse him), as soon as he had made himself sufficient master of the art of casting the type, and joining the characters (notwithstanding he had given an oath of secrecy), took the earliest opportunity of robbing his master of the implements of his

art; choosing, for the completion of his purpose, the night preceding the Feast of the Nativity, when the whole family, with the rest of the inhabitants of the city, were at church, hearing the midnight mass. That he escaped with his booty to Amsterdam, thence to Cologne, and, lastly, that he took up his residence at Mentz, where he established his printing-press; from which, within the following year, 1442, were issued two books, printed with the characters which had been before used by Lawrence Coster at Haarlem: the one entitled 'Alexandri Galli Doctrinale,' the other 'Petri Hispani Tractatus.'

This account, Junius assures us, he had from several old gentlemen who had filled the most honourable offices of the city, and who themselves had received it from others of equal respectability and credit, as a well-founded tradition; as a lighted torch, he says, passes from one hand to another without being extinguished. He adds, that he well remembers that Nicholas Galius, the tutor of his youth, who was an old gentleman of very tenacious memory, used to relate that, when he was a boy, he had often heard one Cornelius, then an old man upwards of eighty years of age, who had been a bookbinder, and, in his youth, had assisted in the printing-office of Coster, describe, with great earnestness, the various trials and experiments made by his master in the infancy of the invention: upon which occasions he would even shed tears, especially when he came to the robbery committed by one of the workmen, which he related with great vehemence; cursing those nights in which, as he said, for some months, he had slept in the same bed with so vile a miscreant; and protesting that he could, with the utmost pleasure, execute the thief with his own hands, if he had been still alive: which relation, as Junius tells us, corresponded with the account which Quirinus Talesius, the burgomaster, confessed to him he had heard from the mouth of the same old bookbinder.

It is mainly upon this testimony that the writers of Holland found what they consider the undoubted pretensions of Haarlem to the invention of printing. Junius is the earliest writer at present known who makes express mention of Lawrence Coster as the inventor of typography; but he certainly was not the first who asserted that the art was invented at Haarlem. Scriverius mentions that a treatise expressly upon the subject in question was written at Haarlem, between 1549 and 1561, by John Van Zuyren, who was for some time scabinus or sheriff, and afterwards burgomaster of that city. Theodore Volchart Coornhert, in the dedication of a translation of Cicero's 'Offices' to the burgomaster, judges, and senators of Haarlem, where the book was printed in 1561, also ascribes to this city the invention of the art; as does Guicciardini, in his 'Descrizione di tutti i Paesi Bassi,' printed at Antwerp in 1567, p. 180. All these writers however appear to have founded their statements upon the very same tradition as that related by Junius, with the omission only of Coster's name. The question, it will be readily seen, is too complicated for further discussion here. The reader who would enter more fully into it must consult Meerman's 'Origines Typographicæ,' printed at the Hague in 1765, 2 vols. 4to., and Ottley's 'Inquiry into the Origin and Early History of Engraving upon Copper and in Wood,' 4to., London, 1816, vol. i. pp. 172, and seq. These authors support the cause of Haarlem. Baron Heineken, in his 'Idée Générale d'une Collection complète d'Estampes,' 8vo., Leips., 1771, and Lambinet, in his 'Origine de l'Imprimerie,' 2 vols. 8vo., Paris, 1810, consider the whole story as not entitled to the least credit, and are the chief writers on the other side.

COSTROMA, a province in the eastern part of Russia in Europe, forming a portion of Great Russia, and situated between 57° and 58° N. lat. and 40° and 42° E. long. According to Arsenief its area is about 29,990 square miles: the surface is in general level, and the soil, though not naturally fertile, has been rendered productive: the northern parts of the province are full of swamps, and the southern sandy. The Volga enters Costroma a little above Yaroslaf, in the south, and traverses it in a north-westerly direction: the Costroma and Unsha, or Ounya, as well as the Vetluga, which fall into the Volga on its left bank, drain the northern, eastern, and southern districts. There are several lakes; the largest, that of Galitsh, near the town of that name, is about 10 miles long and 5 broad; and the Tshuklonga, further north, is upwards of 5 miles in diameter. The inhabitants are active agriculturists: though they import wheat, they grow more rye than they

consume, together with much hemp and flax. The land is full of large forests, which are principally crown property. The bear, lynx, wolf, and fox are common. Little attention is paid to the breeding of cattle, but the fisheries are carried on vigorously, and produce nearly 800 tons per annum of salmon, sturgeons, &c. There are considerable manufactures in the province, particularly of linens, woollen cloths, Russia leather of superior quality, brandy, and mats; the majority are established in and about the capital, and the number of hands employed on them is upwards of 6000. There were 19 schools in the province in the year 1832, independently of 11 ecclesiastical seminaries. In 1796 the population amounted to 1,046,092 souls; and as the average increase for the years 1825-6-7 was upwards of 11,200, it cannot at present be estimated at less than 1,500,000. Two-thirds of the rural population are vassals of the nobility, who are the great land proprietors. In summer great numbers of mechanics leave their homes in quest of subsistence in other quarters. The province contains 12 circles, 17 towns, and 851 parishes. It is an eparchate or bishopric, styled the Eparchate of Costroma and Galitsh, and in 1830 contained 11 monasteries, 3 nunneries, 13 what are termed cathedrals, and 858 churches. The revenue which Costroma yields is about 3,300,000 roubles a year (about 150,000*l.* sterling). The principal towns, besides Costroma, the capital, are Galitsh (about 7000 inhabitants); Makurief, the town next in importance to Costroma for its trade (3000); Yurgowetz-Powolskoi (2600); Sol-Galizkaya (3400); and Kinishna (2400).

COSTROMA, the seat both of the civil government of the province and of the military government of Costroma and Vladimir, is agreeably situated at the confluence of the Volga and Costroma, or Kotorosla, in 57° 45' N. lat. and 41° 12' E. long., about 325 versts (about 217 miles) to the north-east of Moscow. It is said to have been built in the year 1152, and was united to the grand duchy of Moscow by Ivan Vassiljewitsh I. A wall of earth, which has been converted into walks, surrounds it. The upper part of the town covers a height, on the summit of which stands the cathedral, a handsome edifice, surrounded by trees and showy buildings. In this quarter are the government buildings, with the 'Gostinnoi-Dwor,' or bazaar, a spacious quadrangle with piazzas, facing them; and betwixt them is the flower and fruit-market, which is held under a roof covered with canvass. Below this upper town, and above the lower town, is another quarter, built entirely of stone; and along the high banks of the Volga runs the third quarter, consisting of a long line of neat houses, of wood and stone, relieved by the trees and gardens interspersed between the buildings. Costroma contains 42 churches, besides 11 chapels, a mosque, and 2 wealthy and spacious monasteries. One of these establishments, that of Ipatzkoi, founded in 1330, is celebrated as having been the spot from which the czar, Michael Fedorovitsh Romanoff, the father of the present dynasty, emerged, in 1613, to assume the sceptre of Muscovy. The gate through which he then turned his back on the hood and cowl has been kept closed ever since. The bishop of Costroma has his residence in this monastery, which is enclosed with a stone wall. There is a Tartar suburb and mosque outside of the walls. Costroma is an affluent and thriving town; it has 8 asylums for the indigent, an ecclesiastical seminary, a high school and a district school, about 1100 houses, and about 10,000 inhabitants, who are employed partly in trade and partly in the manufacture of linens, Berlin-blue, sealing-wax, soap, leather, bells, &c. It has periodical fairs.

COSTS, in the technical sense of the word, are the expenses incurred by parties in proceedings at law or in equity. In civil actions particular importance and interest attach to the principles and practice concerning them, since, though in themselves merely incidental and subordinate to the main cause of action, it not unfrequently happens that they become a prominent object of anxiety and contention. Under the head of COSTS IN CIVIL ACTIONS may be considered the steps by which the mutual rights and liabilities to them were originally created, and have been subsequently qualified; the modifications to which those rights and liabilities are subjected by reason of the particular character in which the parties may sue or be sued; and the practice by which the amount of costs is ascertained and controlled.

At common law neither the plaintiff nor the defendant was entitled to recover costs the one from the other as a matter of right; the only liability which attached to the

unsuccessful party, beyond the direct result of the suit, being an amercement imposed upon him for his false complaint or defence. If, however, the plaintiff succeeded, the jury were at liberty, and were usually directed, to take his costs into consideration in estimating the amount of damages. And before there was any legislative enactment upon the subject, it is said that the justices in eyre, and afterwards those of assize and nisi prius, were in the habit of assessing the plaintiff his costs, exclusively and apart from the damages.

The first statutory provision with respect to costs was that of the statute of Marlbridge (52 Hen. III., c. 6), which gave them to the defendant in one particular case (wardship in chivalry), which became extinct in the reign of Charles II. Then came the statute of Gloucester (6 Edw. I., c. 1), by which a successful plaintiff recovered the costs of his suit in all cases where he was previously entitled to recover damages. The right to costs under this statute, which were styled costs of *increase*, was entirely independent of the amount of damages recovered. The consequence of this being found mischievous, power was given to the judges by the stat. of 43 Eliz. c. 6, s. 2, in all personal actions, except such as concerned the title or freehold of land, and those of battery, where the debt or damages did not amount to 40s., to grant a certificate of that fact, and to award to the plaintiff no greater or more costs than the sum of the debt or damages recovered should amount to, but less at their pleasure. Owing to the indisposition of the judges to grant certificates under this statute, it was for some time wholly inoperative, and it was therefore enacted, by the statute of 22 and 23 Car. II., c. 9, s. 136, that in all actions of trespass, assault, and battery, and other personal actions, where the jury should find damages under 40s., the plaintiff should recover no greater costs than damages, unless the judge should certify that an assault and battery were sufficiently proved, or that the freehold or title of land was chiefly in question. It has been observed of this statute, with great show of reason, that the legislature intended by it to preclude the plaintiff absolutely from recovering full costs, where the damages were below 40s., in all personal actions but those specially named, and even in them, unless the judge gave them by a certificate under the act. It received, however, a different construction from the courts, by which it was held to apply to those actions only in which it was possible to grant the prescribed certificate, all others being left to the provisions of the previous statute. Wherever therefore it appeared, either from the form of the action, or from the pleadings, or the nature of the case, that no question of a battery, or of freehold or title of land, could possibly be involved in the dispute, so as to give the judge the option of certifying, it was held that the plaintiff would be entitled to full costs, notwithstanding the statute.

It may here be observed, that the changes which have recently taken place in the rules of pleading seem to have worked a virtual repeal of so much of the statute of Charles as relates to trespasses on real property.

By a statute passed in the reign of William and Mary, and repealed by the new Game Act of the present reign, full costs of suit were given to plaintiffs, in actions where 'inferior tradesmen, apprentices, and other dissolute persons' were found guilty of trespassing upon other persons' lands in pursuit of game or fish. And by the statute of 8 and 9 Will. III., c. 11, full costs were given to the plaintiff in actions of trespass, where the judge should certify that the trespasses were wilful and malicious.

In the particular case of actions for oral slander, where the words are actionable in themselves, either from their own intrinsic meaning, or from having been spoken of a party in reference to his profession or trade, the plaintiff's right to more costs than damages, where the latter fall short of 40s., is absolutely barred by the statute of 21 Jac. I., c. 16.

Hitherto, those statutes only have been considered which relate to a *plaintiff's* right to costs. The first act which recognised the interest of *defendants* in personal actions was one passed in the twenty-third year of Henry VIII., which, jointly with another act of the reign of James I., gives costs to the defendant where the plaintiff is nonsuited or has a verdict passed against him, in all cases in which the plaintiff would have been entitled to them if he had succeeded. By a subsequent enactment of the reign of Elizabeth, costs are given to the defendant where the plaintiff is guilty of delay or discontinuance in his suit. The defendant's right to costs is farther extended by an act of the present reign, which gives him proportional costs in cases where the plaintiff

enters a *nolle prosequi*, i. e., remits his suit as to part of his alleged cause of action. The same act gives reasonable costs to one or more of several defendants sued together, who shall have a *nolle prosequi* entered as to him or them, or upon trial of the action shall have a verdict pass for him or them, unless the judge shall certify that there was reasonable cause for joining him or them in the action.

In cases cognisable by the court of requests or of conscience of any city, borough, or town, it is usually provided by the statute creating the jurisdiction of the inferior court, that if the plaintiff recover any sum within the limits of the inferior court, he shall not be entitled to costs; and that the defendant, if he succeed, shall recover double costs.

It having been found that plaintiffs frequently oppressed their debtors by arresting them for a larger sum than that which they really owed, thus subjecting them to greater expense and difficulty in procuring bail and effecting their liberation from custody, it was enacted, by the stat. of 43 Geo. III., c. 46, that if a plaintiff did not recover the sum for which he arrested and held the defendant to bail, the court, upon motion, might direct that the defendant should be allowed his costs, if it should be made appear by affidavit, to the satisfaction of the court, that the plaintiff had not any reasonable or probable cause for holding to bail to that amount. To bring a case within this statute it would seem to be necessary to make it appear to the court *affirmatively* that the plaintiff had no reasonable or probable cause, and that a case of suspicion only will not be sufficient to entitle the defendant to his costs. In estimating the amount of probable cause, the court will take into consideration the particular circumstances of the case in question, and not merely the amount of the verdict.

In the late very important changes which have been made with regard to the mode of pleading in civil actions, the courts have taken great pains to provide a more equitable apportionment of costs between the parties than was formerly observed. Thus, for many of the cumbersome and prolix forms in which it was usual to state the more ordinary causes of action, they have prescribed certain concise precedents, an adherence to which is enforced by allowing to the defendant the costs occasioned by any excess, and throwing them upon the party really in fault, the plaintiff's attorney. By another rule, made expressly for the benefit of defendants, it has been ordered, that no costs shall be allowed to a plaintiff upon any count or issue upon which he has not succeeded at the trial, and that the costs of all issues found for the defendant shall be deducted from the costs payable to the plaintiff. The effect of this rule is most important, inasmuch as it puts an end to the former unjust practice, which in some cases allowed the plaintiff costs, and in others disallowed them to the defendant upon those issues upon which the latter was successful. By a still later rule, directed both against plaintiffs and defendants, it has been ordered, that where several counts or pleas shall have been put upon the record, the successful party shall not be allowed any costs upon the issue or issues upon which he succeeds, unless the judge trying the cause shall be of opinion, and shall so certify, that a distinct subject matter of complaint or defence was *bonâ fide* intended to be established in respect of each count or plea.

As to the manner in which the right or liability of a party to costs may be modified by the particular character which he sustains, a striking instance used frequently to occur in former days, in the case of plaintiffs suing in the representative character of executors or administrators. In favour of such parties it was held, that wherever they sued for a cause of action which they could not have recovered in their individual capacities, they would not be liable to the defendant for costs, upon being nonsuited, or having a verdict pass against them. For some time a notion prevailed that this exemption proceeded from a consideration of the degree of ignorance under which they were supposed to lie with respect to the contracts or other causes of action of the deceased parties whom they represented. But the sounder opinion at length obtained, that the true cause of this freedom from liability was to be found in the particular language of the different enactments bearing upon the subject.

After having been long considered too extensive, this privilege has been effectually curtailed by an enactment of the present reign, 3 and 4 Will. IV., c. 42, s. 31, which puts executors and administrators upon the same footing with other plaintiffs, unless the judge before whom the action shall be brought, or a judge of any of the superior

courts, shall otherwise order. The disposition of the courts, with regard to this act, appears to be not to interpose in behalf of the plaintiff, unless the defendant has brought the action upon himself by practising something like a fraud upon the plaintiff, thus discouraging the practice formerly prevalent of bringing merely speculative actions in a representative character, under the shelter of immunity from costs.

In penal or *qui tam* actions, the plaintiff's right to costs depends altogether upon the provisions of the statute which creates the cause of action. There are also express statutes which impose additional liabilities upon a plaintiff of this class under certain circumstances.

When a party has obtained the permission of the court to sue *in formâ pauperis*, i. e. to be provided, on account of his poverty, with all necessary writs, as well as with counsel and attorney, gratis, he will not be liable to pay any costs, but he will still be entitled to receive them.

The mode in which the amount of costs payable between the parties is ascertained, is by taking the *Nisi Prius* records, with all the papers, briefs, and other documents, to the proper officer of the court, who then taxes the costs according to a certain prescribed scale, allowing or disallowing particular charges at his discretion. Before the late act for the amendment of the law (3 and 4 Will. IV., c. 42), a different system of taxation prevailed in the different courts at Westminster, to remedy which defect power is given to the judges, by the act referred to, to make regulations for establishing an uniform practice in all.

Hitherto we have only considered *single* costs, or those derived from the statute of Gloucester. In some cases *double* and *treble* costs are expressly given by statute: and wherever a statute gives double or treble damages, the plaintiff shall also have double or treble costs. The following is the manner in which double costs are calculated:—First, the prevailing party is allowed his single costs, which include the expenses of witnesses, counsel's fees, &c., and afterwards he is allowed half the amount of the single costs, without making any deduction on account of counsel's fees, &c. Treble costs consist of the single costs, half the single costs, and half that half again.

Such are some of the principal matters relating to costs in actions at law, a subject so purely technical in its nature, that any minute inquiry into its rules and mode of administration would be foreign to the purposes of this work. Between the courts of equity and those of common law there is this important difference with respect to costs, that the former are not bound by any of the enactments above enumerated, but are invested with a discretionary power upon the subject. In the exercise of this power they are guided, not merely by the event of the suit, but by a consideration of its real merits, and of the interests of the parties concerned. Thus, although the party failing is *primâ facie* liable for the costs, he will be relieved from the burden if he has prosecuted the suit in the conscientious discharge of a duty imposed upon him as a trustee for the benefit of others. On the other hand, a party proceeding erroneously will not be allowed the costs of his erroneous proceedings, even though the decree of the court may ultimately be in his favour.

In *criminal proceedings* the rights and liabilities of parties to costs depend altogether upon express statutory enactments. With a view to forward the ends of justice, provisions have been made by various statutes to defray, out of the funds of the county, at the discretion of the court, the expenses incurred by prosecutors and their witnesses in cases of felony. (*Hullock on Costs*; *Tidd's Practice*; *Archbold's Practice of the Court of King's Bench*; *Grant's Practice of the High Court of Chancery*.)

CÔTE D'OR, a department in France, forming part of the antient province of Bourgogne. It is bounded on the north by the department of Aube, on the north-east by that of Haute Marne, on the east by that of Haute Saône, on the south-east by that of Jura, on the south and south-west by that of Saône-et-Loire, on the west by that of Nièvre, and on the north-west by that of Yonne. Its form is irregularly oblong: the greatest length is, from N. N. W. to S. S. E., about eighty miles; and the greatest breadth at right angles to the length is about seventy miles. The area of the department is about 3365 square miles; and the population, in 1832, 375,877, or 111 or 112 to a square mile, being much below the average of France. Dijon, the capital, is 161 miles in a straight line south-east of Paris, or 185 miles by the road through Melun, Sens, Joigny, and Tonnerre.

This department is traversed in the direction of its breadth by hills, forming part of the chain which connects the Cévennes with the Vosges. A range of these hills to the south-west of Dijon is called Côte d'Or, the golden slope or upland, and gives name to the department.

These hills separate the basin of the Seine from that of the Saône and Rhône. The Seine itself, and its tributaries, the Brevon and the Ource, with its feeders the Digenne and the Grame, rise on the north-western slope of these hills; as do the Voisin, the Cousin, the Serein, with its feeder the Argentalet, and the Armançon, with its feeders the Brenne, the Lozerain, and the Loze, whose waters all find their way into the Yonne, an important tributary of the Seine. The Ource does not rise in this department, but just within the adjacent one of Haute Marne; it has however the greater part of its course in the Côte d'Or. On the south-eastern slope of the hills rise the Tille, with its feeders the Ignon and the Norges, the Suzon, a tributary of the Ource, and the Meuzin, Mauzin or Meuzain, with its tributary the Bouzoire. The Ource rises on the northern side of the hills, but passes through a depression, by which the chain is separated into two parts, and, with all the waters from the south side, flows into the Saône. The Dheune or Dheure, a tributary of the Saône, flows along the southern boundary of the department: the Arroux and the Gers, which fall into the Loire, water the south-western part. The Saône waters the south-eastern part of the department.

In agricultural produce the department of Côte d'Or is, on the whole, rich: the quantity of wheat raised is half as much again as the average produce of the departments of France, and in rye and mixed corn double. In maize the produce is rather below the average; in barley, oats, buckwheat, and potatoes, very much below. In wine, which is chiefly produced in the southern part of the department, where the range of the Côte d'Or extends, the produce is very great. Not only is the quantity of land occupied by the vine more extensive than in the average of the departments, but the vines are much more productive. The wine, which is chiefly red wine, is known by the general name of Bourgogne (Burgundy): the first growths are La Romanée-Conti, Chambertin, Richebourg, Clos-Vougeot, La Romanée-St. Vivant, La Tache, St. George, and Corton: of white wine, the only first growth is Puligny. Much wine is exported. The quantity of woodland is much above the average. Horses and horned cattle are numerous, especially the former; but of sheep the number is comparatively small. The wool grown is altogether insufficient for the wants of the department; and as there are few woollen manufactures, the inhabitants have to import woollen cloths and other goods. The fields in this department (on the western side at least) are divided by quickset hedges as in England.

The north-east part of the range of hills which we have mentioned as crossing the department, contains iron; and there are many iron-works, for carrying on which the quantity of wood affords great facility. The department is well provided with the means of communication: the high road from Paris by Dijon to Geneva passes through the middle of it, and that from Paris by Auxerre and Châlons-sur-Saône to Lyon crosses it in the south-west part; these are both roads of the first class. Roads of the third class connect these two: one from Montbard to Saulieu; another from Rouvray by Vittaux to Dijon; and a third from Dijon by Beaune to the village of La Rochepot: five other roads of the same class unite at Châtillon-sur-Seine, in the north part of the department; and two others lead, one from Dijon to Langres (department of Haute Marne), where it meets the high road from Paris to Bâle or Basel, and the other from Beaune to Dôle and Besançon. The Canal de Bourgogne traverses the department, following the valleys of the Armançon in the north-west and the Ource in the south-east. The Saône is the only navigable river. There is no predominant manufacture in the department, unless we except that of iron wares: some cottons and woollens are made; also paper, leather, hats, earthenware, copper utensils, and some chemical articles, as soda, chlorine, and acetic acid.

The department of Côte d'Or is divided into four arrondissements or sub-prefectures: that of Châtillon in the north, population 52,226; that of Dijon in the east, population 135,435; that of Beaune in the south, population 117,996; and that of Sémur in the west, population 70,220. The department constitutes the diocese of Dijon, the bishop

of which is a suffragan of the archbishop of Lyon. It is under the jurisdiction of the Cour Royale of Dijon; and sends five members to the Chamber of Deputies. It is in the eighteenth military division, the head-quarters of which are at Dijon.

The principal towns are Dijon (population 25,352 for the town, 25,552 for the whole commune), on the river Ouche, at the junction of the Suzon; Beaune (population 9272 for the town, 9908 for the whole commune); Sémur (population 3985 for the town, 4088 for the whole commune), on the Armançon; Châtillon-sur-Seine (population 3689 for the town, 4175 for the whole commune); Seurre (population 3571 for the town, 3591 for the whole commune), on the Saône; Auxonne (population 3477 for the town, 5287 for the whole commune) on the Saône; and Saulieu (population 3050), near the springs of the Voisin, the Cousin, and the Argentalet. For Dijon, Beaune, and Auxonne, we refer to their respective articles: of Sémur, Châtillon, Seurre, and Saulieu, as well as of some smaller towns, we subjoin an account.

Sémur, the capital of an arrondissement, 148 miles from Paris by Avallon, and 40 from Dijon, is sometimes called Sémur-en-Auxois (Auxois was a division of the former province of Bourgogne), to distinguish it from another town of the same name (Sémur en Brionnois) in the adjoining department of Saône et Loire. It is built on a granite rock, on the picturesque banks of the Armançon, which nearly encircles the town, and over which are two good bridges. The streets are neat, and tolerably paved; the houses handsome, and the public walks agreeable. There is an antient church, and a 'donjon' composed of four antient Gothic towers. The population, in 1832, was 3985 for the town, or 4088 for the whole commune. The manufactures of Sémur are cotton and woollen yarn, calico, woollen cloth, umbrellas, and bee-hives. There are many nursery-grounds near the town, and trade is carried on in corn, wool, and hemp grown in the neighbourhood. The frogs of Sémur are in high repute; and it is said that by the sale of these creatures, 600*l.* or 800*l.* is obtained yearly. Sémur is the residence of a number of the antient gentry of the district, whose resources have however been much impaired by political changes. There were, before the Revolution, many religious houses. There are a *tribunal de première instance*, a high school, a small public library, a small theatre, and the *depôt de mendicité* (poor-house) of the department. The town of Sémur was the only one in Bourgogne that in the time of the League adhered to Henry IV., who recompensed the fidelity of the inhabitants with some marks of favour. It was reduced to ashes by fire, A.D. 1588. The celebrated Saumase (Salmasius), the antagonist of Milton, was born in this town in the same year.

Châtillon, distinguished as Châtillon-sur-Seine, from its situation on the banks of that river, is on the road from Paris to Dijon by Troyes, 134 miles from Paris, and 48 from Dijon. The town, though with a population of no more than 3689 (4175 for the whole commune), extends for about a mile along the road. The main street is neat and of considerable breadth. There is a handsome château on an eminence, with a garden, park, and piece of water, which belonged to Marshal Marmont, a native of this town. At a short distance from the town, on a hill planted with trees, is the striking ruin of an antient castle of the dukes of Bourgogne. From the foot of this hill rises the Douix, a stream which, though it joins the Seine at the distance of a few musket-shots from its spring, equals in winter the Seine itself in the volume of water, and in summer surpasses it. The town possesses an hospital and a high school, a library, a *tribunal de commerce* or mercantile court, and a subordinate court of justice, *tribunal de première instance*. The trade of the town and its immediate neighbourhood is considerable: the chief manufactures are iron wares, cotton goods, coarse woollens, leather, cask staves and hoops, paper, and hats: there are breweries and bleaching houses for wax. Much agricultural produce, wine, wool, and wood, horned cattle and sheep, is sold at the weekly market. While Marshal Marmont occupied the château, he had a large farm, in which the most improved methods of cultivation were practised, and where he kept a numerous flock of merino sheep, and breeding-stables for horses: he had also in his park iron-works, and manufactories of beet-root sugar, of sal-ammoniac, and of vermicelli. The immediate environs of the town are devoted to the cultivation of oats and

rye. Of the whole arrondissement one-third is woodland, from which the iron-masters derive their fuel.

Châtillon was in the middle ages a place of some strength, and the capital of a county, which was long united to the duchy of Bourgogne. There were, before the revolution, many religious houses. In 1814 it was the seat of fruitless negotiations for peace between Napoleon and the allies. It is much resorted to in winter by the neighbouring gentry.

Seurre is on the left or south-east bank of the Saône, and on the road from Beaune to Dôle and Besançon, 220 miles from Paris by a circuitous road through Dijon and Beaune, and 38 from Dijon. The situation of the town is very pleasant; the houses are well built of brick; and there is a fine park, which serves as a promenade for the townsmen, with a château of modern construction, built in imitation of the English style. There were formerly several religious houses here for persons of both sexes. There is a bridge over the Saône, which has been repeatedly carried away and re-established. The inhabitants (population 3571 for the town, 3591 for the whole commune) carry on trade in corn and hay, the produce of the neighbourhood, to which we may probably add fish and fruit.

Saulieu is on the great road from Paris by Auxerre and Châlons to Lyon, 152 miles from Paris. It is a place of considerable antiquity, and existed in the time of the Romans. Ammianus Marcellinus, the Itinerary of Antoninus, and the Theodosian Table mention it under the name of Sidolocum. There existed for some time the remains of a building, which was always considered to have been a temple of the sun; and some antiquities dug up in the neighbourhood have served to confirm the tradition. It is said that St. Andoche, one of the early missionaries of the gospel in Gaul, suffered martyrdom here in the persecution under Marcus Aurelius. At an early period there was established a Benedictine monastery, which was, A.D. 731, pillaged and burnt by the Saracens, and afterwards re-established and endowed by Charlemagne; but about the middle of the twelfth century it was secularized, the church (dedicated to St. Andoche) was made collegiate, and the ample revenues of the monks were for the most part appropriated by the bishops of Autun. In 1359 Saulieu was sacked, and the church pillaged and burnt, by the English. In the wars of the subsequent period, domestic and religious, it suffered much. In 1579 it was besieged by the army of the League under Tavannes, to whom it surrendered; but the inhabitants, a few years after, admitted the royalist troops. The immediate site of the town is flat, but it is half way up a hill of considerable elevation, which rises on the south-west: the town itself is walled: the faubourgs or suburbs are more extensive than the town and better built. The population in 1832 was 3050. Saulieu has long been a place of great trade: there are twelve considerable fairs in the year; and there is a *tribunal de commerce* for the regulation of mercantile affairs. Cotton yarn is spun; this branch of industry was introduced by the curé or parish priest, M. Meigret, A.D. 1760, for the charitable purpose of giving employment to the poor: woollen cloths and hosiery are made; and tannery is carried on, though not to the same extent as formerly; in the early part of the last century there were 22 tan-yards. The other articles of trade are produced in the neighbourhood; wine, wool, flax, hemp, timber (especially staves for casks), fire-wood, turnips, which are in great repute, and cattle: the cattle are reared in the pastures of Morvan, a neighbouring district, and sold to the people of Lorraine and Alsace. Saulieu was the native place of the engineer Vauban. Before the Revolution there were a small hospital and one or two religious establishments.

Arnay-le-Duc is on a branch, now disused, of the road from Paris to Lyon, about 167 or 168 miles from Paris. It is near the river Arroux, whence it is sometimes called Arnay-sur-Arroux. The population, in 1832, was 2412 for the town, or 2563 for the whole commune. The chief trade of the place is in grain, wool, and cattle. Some coarse woollens, serges, and druggets are manufactured. There was formerly a castle here, of which one tower yet remains; it was used about the middle of the last century as a town-hall.

Nuits or Nuyts or Nuys is a small town at the foot of a hill, on the river Mauzin or Meuzain, 14 or 15 miles from Dijon, on the road to Beaune. The town was formerly fortified. It was taken by the Germans who, in the religious wars of the sixteenth century, came to the aid of the French

Protestants: after the town had capitulated, it was set on fire, and many of the inhabitants massacred. The walls were afterwards allowed to go to decay, and ultimately the site of them and of the ditches was disposed of for building houses. Coarse woollens and paper are made, and there are many dye-houses. The neighbourhood affords good building and paving stone; but it is especially famous for its wine, which bears the highest character. The population, as given in the *Forces productives de la France* of M. le Baron Ch. Dupin (1827), was 2633. Thurot, a French naval commander, killed A.D. 1760, in a naval combat with the English, on the coast of Ireland, was a native of this town.

Meursault, rather a village than a town, is in the neighbourhood of Beaune. It is famous for its wines. The population, in 1832, was 2016 for the place itself, or 2066 for the whole commune.

Montbard or Montbart is on the road from Paris to Dijon by Joigny and Tonnerre, 142 miles from Paris and 42 from Dijon: it is on the river Brenne, a little above the junction of that river with the Armançon. The town is built on the slope of a hill, and behind it rise the gardens of the château which has been rendered illustrious as the residence of the naturalist Buffon. In the highest part of the gardens (which include the summit of the hill) is an antient tower, the relic and memorial of a castle which in feudal times commanded the place. The walls of the castle and several of the towers were standing till a comparatively late period. The town is divided into two parts by the Brenne: the streets are steep and irregular, but neat. The inhabitants, in 1832, amounted to 1916 for the town, or 2074 for the whole commune: they manufacture dog-skin gloves, laces, woollen cloth, and hosiery; and trade in wool, hemp, wood, and leather. There are some iron-works at the village of Buffon in the neighbourhood, established by the great naturalist: marble is also quarried not far off. The house of M. Buffon is in the main street of Montbard, and is a plain building: the court and the garden (the entrance to which is by steps) are behind. The garden is laid out in terraces rising one above another, and planted with trees, chiefly foreign, which form agreeable thickets. The pavilion in which Buffon wrote the principal part of his great work is still standing, but it has suffered during the revolutionary troubles, in the course of which it was pillaged, and much of the furniture which was in it in the time of Buffon has disappeared: there are in the house some remains of his cabinet of natural history. Buffon was a native of Montbard, which was also the native place of his coadjutor d'Aubenton, whose experiments for the improvement of wool were carried on here. The Canal de Bourgogne passes close to Montbard.

Nolay is in a narrow valley on the road from Beaune to Autun. It had, according to '*Le Dictionnaire Universel de la France*' (1804), 1988 inhabitants: they manufacture woollen cloth, common hats, and leather. Carnot was born here. The vineyards of Montrachet, which produce the finest white wine in the department, are near this town.

Vitieux or Vitteaux is on the river Brenne, and on the road from Paris to Dijon by Auxerre and Rouvray, 160 miles from Paris and 28 from Dijon. It is a small town, of tolerably good appearance, with the ruins of an antient castle, destroyed in 1631 by the order of Louis XIII., and a public walk of plane-trees. The inhabitants amounted, in 1832, to 1904 for the town, or 1919 for the whole commune: they manufacture woollen cloth, and trade in grain, wool, hemp, hay, and some wine. Near the town is a water-mill for expressing oil. Many Merino sheep are bred in the neighbourhood.

St. Jean de Losne is on the right or north-west bank of the Saône, at the point where the Canal de Bourgogne joins that river. It is known in history for the gallant defence made by the townsmen, 400 in number, and a garrison of 150 soldiers, against the forces of the duke of Lorraine and the imperial general, Matthias Gallas,* amounting to 60,000 or even 80,000. Under the command of the chief municipal officers, and supported by the courage of the women, who shared the dangers of the fight, the defenders withstood and repelled two successive assaults. The approach of a body of French troops caused the siege to be raised. Louis XIII., then king of France, recompensed the loyalty of the townsmen by an exemption from taxes of all sorts. The inhabitants, in 1832, amounted to 1744: they

* Malte Brun, confounding these two leaders, speaks of the assailants as being under the command of 'Le Grand Duc Galéas.'

trade in grain and hay, and manufacture woollen cloths and serges: there are some breweries.

Selongey is a small town on the Venelle, a streamlet flowing into the Tille, but which is in summer often dried up. It had, in 1832, a population of 1687. Good horses are bred in the neighbourhood. The other towns are Bezé, Grancey-en-Montagne, Is-sur-Tille, Mirebeau, Pontaillier-sur-Saône, St. Seine, Sombernon, and Thil-le-Châtel, in the arrondissement of Dijon; Bligny, Châteauneuf, Cîteaux, where was a celebrated abbey [CITEAUX], Mont St. Jean, and Pouilly, in that of Beaune; Bussy-le-Grand, Chanceaux, Epoisses, Flavigny, Moutier St. Jean, Sainte Reyne, and Rouvray, in that of Sémur; and Aignay-Côte-d'Or, Baigneux, Laignes, Recey, and Vanvey, in that of Châtillon. But the population of each of these towns is probably below 1500.

COTE' DROIT, COTE' GAUCHE, the names given to the two great divisions of the Chamber of Deputies, or French representative assembly. That assembly, like most other representative bodies in Europe, consists of individuals some of whom are inclined to favour the royal prerogative, while others are in favour of democracy, or popular supremacy. The former take their seats on the benches which are to the right of the President's chair; the other on those to the left. The shape of the House is a semicircle, with nine or ten rows of seats raised one above the other. The President's chair is in the middle of the chord, facing the assembly. As in every great political party there are shades of opinion, some being more warm and violent, and others more moderate, discriminating, or cautious, so both the coté droit and the coté gauche are generally subdivided into three sections each. The more zealous royalists take their seats at the outer extremity of their side of the House towards the President, and are styled the 'extrême droite;' the ultra-liberals sit on the corresponding seats on the opposite or left side, and are styled the 'extrême gauche.' Next to each of these extremes, moving inwards towards the middle part of the curved line of the semicircle, sits the main body of each of the two divisions, which are simply styled coté droit and coté gauche, or la droite et la gauche, composed of men who are the professed supporters of certain fixed principles, monarchical or popular, free however from violence or faction. From the middle of each side of the House to the point directly opposite to the president, the remaining sections, forming two-fourths of the semicircle, are called the centre droit and centre gauche, and are occupied by members who, although with some shades of difference in their opinions, generally vote for ministers. These two centres united form about one-half of the House, and are in fact what in England would be called the ministerial side of the House. But instead of one opposition, as has been until now the case in the British parliament, there are in France two oppositions, right and left, of opposite sentiments, one royalist and the other liberal. According as the measures of the ministry for the time being are acceptable to either of these two parties, they obtain the votes of part of either coté, which, joining the two centres, gives the majority to ministers.

In the legislative assembly which succeeded the first national or constituent assembly in 1791, and which destroyed the monarchy, the left was occupied by the republican members, who were themselves divided into Girondins and Montagnards. The name of Montagne was given to the extreme or terrorist party, because its members crowded together on the upper seats of the left, where, seen from below, they formed a mountain of heads, dark and threatening in appearance.

COTENTIN, or **COUTANTIN**, a district in France, now comprehended in the department of Manche, except a small portion which is included in the department of Calvados. It took its name from its capital Coutances. Cotentin is a peninsula, jutting out into the English channel, by which it is bounded on the north, the west, and part of the east side; on the remaining part of the east side (viz., the south-east) it is bounded by the districts of Bessin [BAYEUX], and Le Bocage [BOCAGE], and on the south by the district of Avranchin. [AVRANCHES.] The length from N.N.W. to S.S.E. is about eighty miles, the breadth above thirty. It is watered by the river Vire, which divides it on the east from Bessin and Le Bocage, the Douve, and several smaller streams. The strata are chiefly of granite and schistus, and the soil is fertile in grain, but especially in pasturage; much butter is made, and many horses are reared, which are

much esteemed: poultry is reared and sent to Paris. The quantity of wood is not great, and there are no vineyards, but cider is made in considerable quantity. Hemp and flax are grown. [MANCHE, DEPARTMENT OF.] The chief towns included in the district, with their population in 1832, are as follows:—Coutances, the capital, 8957; Cherbourg, 18,377 for the town, 18,443 for the whole commune; Granville, 7350; Valognes, 6338 for the town, 6940 for the whole commune; St. Vaast, 3502; Villedieu, 3074 for the town, 3095 for the commune; Montebourg, 2423 for the town, 2523 for the commune; Carentan, 2292 for the town, 2773 for the whole commune; and Périers, 1934 for the town, 2605 for the whole commune. The map of the 'Encyclopédie Méthodique' includes St. Lo (8154 for the town, 8421 for the whole commune) in Cotentin: we believe this to be correct.

Cotentin has many islands along its coast line.

COTES, ROGER, born July 10, 1682, at Burbage, near Leicester, of which place his father was rector. His first education was received partly at Leicester school, partly from an uncle, who was the father of Dr. Robert Smith, the author of the *Optics*. He was afterwards placed at St. Paul's School, and in April, 1699, was admitted at Trinity College, Cambridge, of which foundation he was elected Fellow in 1705. In January, 1706, he was elected Plumian Professor, at the time of the establishment of that Chair. In 1713 he took orders. He died June 5, 1716, aged thirty-four, and is buried in the chapel of his college, where there is an epitaph upon him by Dr. Bentley. He was succeeded in the Plumian professorship by his cousin, Dr. R. Smith, the editor of his works. (*Biographia Britannica*.)

The early death of Cotes being taken into account, few persons have left more reputation behind them than he did, in matters of exact science. Newton is reported to have said, 'If Cotes had lived, we should have known something.' As it is, we have not much to say in a biographical article. The discoveries of Cotes have exercised an influence upon various parts of mathematics, which will be alluded to in the proper place. For his reputation on the continent, it is unfortunate that he died so near the termination of the discussion relative to fluxions. The problems which he left were made the subject of a challenge to foreign mathematicians by Dr. Brook Taylor, in the interval which elapsed between his death and the publication of his works; and some bitterness of feeling was excited which was unfavourable to the proper estimation of their merits. (Montucla, *Hist. des Math.*, vol. iii., p. 154.) We shall now briefly describe them.

The first work which Cotes published was the second edition of Newton's 'Principia' (A.D. 1713), to which he prefixed the well-known preface. This treats of gravitation in general, and of the objections which were made to it. He also published an account of a remarkable meteor in the 'Phil. Trans.' for 1715. His hydrostatical and pneumatical lectures were printed after his death in 1738, by Dr. R. Smith.

The mathematical papers of Cotes were published after his death by Dr. Smith, under the title of 'Harmonia Mensurarum, sive analysis et synthesis per rationum et angulorum mensuras promotæ: accedunt alia opuscula mathematica,' Cambridge, 1722. The most definite description which can be given of it is, that it was the earliest work in which decided progress was made in the application of logarithms and of the properties of the circle, to the calculus of fluents. The first book contains an extended comparison of systems of logarithms, with applications of them to the finding of areas. The second is what we should now call a table of integrals, depending on logarithms and arcs of a circle. The third consists in applications of the second. Then follows a mass of extensions, digested, mostly from Cotes's papers, by Dr. Smith. The *opuscula* consist in, 1. A tract on the estimation of errors in mixed mathematics, consisting mostly of an investigation of the method of choosing spherical triangles, so that the errors of the *data* shall produce least effect upon the *quæsitæ*, but ending with what we must call the first glimpse of a method of choosing the proper mean for discordant observations. [LEAST SQUARES, METHOD OF.] 2. A tract on the differential method of Newton. 3. On the construction of tables by differences. 4. On the descent of heavy bodies; on cycloidal motion, &c.

CÔTES DU NORD, a department in France, one of the five into which the former province of Bretagne has been

divided. [BRETAGNE.] It lies on the coast of the great bay of St. Malo, an inlet of the English channel, which bounds it on the north. It is bounded on the east by the department of Ille-et-Vilaine, on the south by that of Morbihan, on the west by that of Finistère; all of which are portions of the antient Bretagne. The greatest length of the department is from W. b. N. to E. b. S., about eighty-one or eighty-two miles; the greatest breadth about fifty-three. The area is about 2868 square miles, and the population, in 1832, 598,872, giving 209 or 210 inhabitants to a square mile, which is above the average population of France. The capital is St. Brieuc, on the small river Gouet near its mouth, 230 or 232 miles in a straight line west of Paris, or 278 miles by the road through Dreux, Alençon, Mayenne, Laval, and Rennes. [BRIEUC, St.]

The coast line of this department is very irregular, being broken by deep bays, the principal of which is that of St. Brieuc, and jutting out in a number of small headlands, of which the following succeed each other from east to west:—Pointe St. Cast, Cap Frehel, Pointe d'Herquin, Pointe de Port de Pomme (these two are at the extremities of the bay of St. Brieuc), Pointe de Plouaze, Pointe de Minar, Pointe de Milfaut, Pointe du Sillon, and Pointe de Chien. The coast is studded with small islands and rocks; Ile d'Embier is near the Pointe de St. Cast, Les Verdelets in the bay of St. Brieuc, the Ile St. Roui and the Iles de Brehat between the Pointe de Milfaut and the Pointe du Sillon, the Ile d'Er between the last point and the Pointe de Chien; the Ile de Gueltat, Ile Tomé, the Iles Melban, Platte, Riouzoï, and the others of the group called les Sept-Iles (the Seven Islands), Les Triagons, the Ile Molenes or Molenoe, and Le Taureau, are to the west of Pointe de Chien.

The Ménez mountains run through this department in the direction of its length, and parallel to the coast: the predominant rock in this chain is granite. From these mountains on the north side flow a number of streams, the general direction of which is north and south, and which after a short course fall into the English channel. The Rance flows first towards the east, it then turns northward, passes Dinan, where the navigation commences, and entering the department of Ille et Vilaine, falls into the sea at St. Malo: this is perhaps the longest river in the department; its whole course is about sixty miles, for fifteen of which it is navigable. The other streams we shall enumerate in the order in which they occur from east to west:—The Fremur; the Arguenon, with its tributaries, the Rosette and the Rieulle; another Fremur; the Evran; the Urne; the Gouet or Goy, which passes St. Brieuc and falls into the sea just below it; the Ic; the Trieux, with its tributary the Leff; the Jaudy and the Guindy, which unite at Tréguier; and the Guer, which passes Lannion, with its tributary the Guier. The streams which rise on the southern slopes of the Ménez mountains flow into the Blavet or the Vilaine, which fall into the Atlantic; except the Hiero, which flows into the Aulne, a river that empties itself into the Brest Road. The Blavet itself rises in the department, as do its tributaries, the Lorette, the Salon, and the Doulas; while the Oust, the Forest, the Lie, the Trinité, the Livet, the Grenedan, and the Mue, immediately or ultimately flow into the Vilaine.

The high road from Paris to Brest traverses this department from E. b. S. to W. b. N., entering it near the little town of St. Jouan de l'Ile, and passing by Lamballe, St. Brieuc, Guingamp, and Belle-Ile-en-Terre.

The climate of this department is temperate, but the atmosphere is foggy near the coast. The soil varies considerably. The Ménez mountains have a dry stony soil, and barren heaths of sand extend both on the north and south side of them; but to these heaths succeed, especially near the coast, plains of very great fertility. Maize and wheat are raised in abundance; a considerable quantity of wheat is exported to Spain and Portugal. Flax and hemp are grown, and apples for the purpose of making cider. The *Encyclopédie Méthodique* states that some wine is made, but that it is consumed in the district: when the vintage is abundant, much of it is converted into brandy. The pasturage is excellent, great numbers of horned cattle are reared, and some horses: butter is made, and sent to Paris and elsewhere. The mineral wealth of the department consists of iron and lead, marble, granite, slate, and coal. The inhabitants are generally engaged in agriculture, in fishing, and in various manufactures, especially of linens, which bear

the name of Breton linens; in making which, in several places, many hands are employed. Like the other departments of Bretagne, this is remarkable for the preponderance of the rural population over that of the towns.

The department is divided into five arrondissements; viz., Loudéac in the S.E. (pop. in 1832, 98,604), and Guingamp in the W. and S.W. (pop. 115,679), both in the inland parts of the department; Dinan on the E. (pop. 111,739), St. Brieuc in the centre (pop. 171,730), and Lannion in the W. (pop. 103,120), along the coast. The chief towns are St. Brieuc, the capital, on the Gouet (pop. 10,420), Dinan on the Rance (pop. 8044), Guingamp on the Trieux (pop. 6100), Lannion on the Guer (pop. 5196 for the town, or 5371 for the whole commune), and Loudéac (pop. 1865 for the town, or 6736 for the whole commune): for an account of which the reader is referred to their respective articles. Of the other towns we shall subjoin a brief notice.

Lamballe is in the arrondissement of St. Brieuc, and on a river which unites with the Evran: it is on the high road from Paris to St. Brieuc, 266 miles from Paris and 12 from St. Brieuc. It is supposed to be an antient place; and according to some, derives its name from the Ambiliati or Ambialites, or Ambialites, who (according to some MSS.) are mentioned in the Commentaries of Cæsar (de B. G. III. 9) among the allies of the Veneti in their naval war against the Romans. The town is surrounded with old walls; the houses are whitened; and the situation of the place in the midst of orchards, gardens, and meadows, renders it very agreeable. It is divided into the upper and lower towns, and has, beside, two suburbs. There is an antient castle, formerly belonging to the Dukes of Pen-thièvre, and a promenade attached to it, planted with large trees. The inhabitants amounted, in 1832, to 4390: they manufacture the best parchment in France, thread, linen, and leather; and trade in cattle. There is a library attached to a reading society in the town. La Noue, a celebrated Huguenot captain, was killed, A.D. 1591, at the siege of Lamballe, which was held by the Duke of Mercœur against Henri IV.

Quintin is on the upper part of the river Gouet, about 10 or 12 miles south-west of St. Brieuc, in the arrondissement of St. Brieuc. It has an antient castle of singular architecture; and in the neighbourhood are two Druidical obelisks or stones, of 26 or 27 feet high, one of which is yet standing; the other has been thrown down. The inhabitants, who amounted in 1832 to 4293, manufacture and export fine linens and iron wares; they trade also in honey, hides, wax, and hats.

Tréguier is in the arrondissement of Lannion, near the sea, at the junction of the rivers Jaudy and Guindy: it is not on any main road. Tréguier was, in the middle ages, a place of greater consequence than now. It was the seat of a bishopric, erected in the ninth century, and appears to have been a prosperous place of trade until it was burnt, A.D. 1592, by the Spaniards who supported the party of the Duke of Mercœur, a blow from which it never fully recovered.

It has now a population of 3178 persons, who carry on considerable commerce; they manufacture linen yarn, and rear a number of the best horses in Bretagne. A good deal of hemp is grown in the neighbourhood, from which sail-cloth is made. The port of Tréguier, which is formed by the æstuary of the rivers, is safe, and accessible to vessels of 200 tons.

Paimpol is in the arrondissement of St. Brieuc, on the coast, not far from the mouth of the river Trieux: it is not on any main road. Paimpol has a safe and convenient harbour, from which vessels are fitted out for the Newfoundland cod fishery; and some trade is carried on in corn, butter, hemp, flax, and linen yarn. The population in 1832 was 1917 for the town, or 2108 for the whole commune.

Moncontour is in the arrondissement of St. Brieuc, several miles south-east of that city. It has a population of 1670. Fine linen is manufactured here.

Pontrieux is in the arrondissement of Guingamp, on the river Trieux (from which it takes its name), several miles above its mouth, and not on any main road. The population in 1832 was 1562 for the town, or 1647 for the whole commune.

The other towns are—in the arrondissement of St. Brieuc, Châtelandren, between St. Brieuc and Guingamp, with the bourgs or subordinate towns of Ploeuc (population of the commune 5453), St. Jacques, Lanvollen,

and Pommerit:—in the arrondissement of Dinan, Jugon, on the Arguënon, on the road between Dinan and Lamballe, and Matignen on the coast; with the bourgs of Broons, St. Jouan de l'Île, and Plancoet:—in the arrondissement of Guingamp, Callac near the Hière, and Ros-trenen near the Lorette, both in the mountainous part of the department; with the bourgs of Belle-île-en-terre and Bourbriac (population of the commune 3613):—in the arrondissement of Lannion are the bourgs of Plestin (population of the commune 5040), La Roche, Lezardieux, and Vieux Marché:—in the arrondissement of Loudéac, Corlay, between Guingamp and Pontivy, on the river Salon; Uzel, near the Oust; and La Cheze on the Lie; with the bourgs of Plemet (population of the commune 3013), Colinée, St. Caradec, Gouarec, Langast, and Merdrignac. Where the population is not given it does not amount to 1500 for the towns or 3000 for the communes. There are several villages in the department which have a large rural population; as Plouha, Plelo, and Louargat, which have above 5000 each; eleven others have above 4000 each. Of the towns mentioned above Uzel is one of the chief marts in the department for the sale of linens; Jugon trades in linen, butter, and corn; and Châtelandren in linen yarn, corn, trefoil seed, cattle, butter, and honey: this last-mentioned town was some years since nearly destroyed, and most of the inhabitants drowned, in a great flood, caused by a neighbouring lake breaking its banks. The village of Corseul, not far from Dinan, preserves the name of the Curiosolitæ or Curiosolites, the tribe who, in Cæsar's time (Cæs. de B. G. II. 34, III. 7, VII. 75), inhabited the district. The traces of a considerable town, destroyed many ages since, may be perceived near this village.

The department of Côtes du Nord constitutes the diocese of St. Brieuc, the bishop of which is a suffragan of the archbishop of Tours. It is under the jurisdiction of the *Cour Royale* or high court of justice of Rennes, and is comprehended in the XIIIth military division, of which Rennes is the head quarters. It sends six members to the Chamber of Deputies. Education here, as indeed throughout Bretagne, is in a very backward state.

COTINGA. [CORACINA (*Coracina Scutata*). PIAUHAU. PROCNIAS.]

COTTAGE. [HOUSE.]

COTTAGE ALLOTMENTS may be considered as such portions of land hired by labourers, either attached to, or apart from, their dwellings, as they, assisted by their families, may be able to cultivate without ceasing to let out their services daily to others. They are thus distinguished from larger portions of land which require some capital and the occupier's whole attention, and consequently partake more of the character of small farms. The object of cottage allotments is to increase the resources of the labourer; firstly, by supplying him with many necessaries and comforts which he would have a difficulty in purchasing from a portion of his wages, and which, if even he could do so, he would purchase at a great disadvantage; secondly, by enabling him to turn everything to profit, so that nothing need be lost. With regard to the quantity of land which ought to be let to the labourer for this purpose, there has been much discussion. Various experiments have been tried, and the opinion of the persons best informed upon the subject appears now to be, that a quarter of an acre is about the quantity which, without prejudice to his other employments, a labourer can in general thoroughly cultivate, and consequently derive the greatest profit from; but this, of course, will vary with circumstances. A large family, some of whom can assist, and uncertain employment, may render a larger portion desirable. In limiting the quantity to a quarter of an acre of land, it must be understood that we are speaking of land under cultivation; where means have been found in a neighbourhood for letting a sufficient quantity of pasture to cottagers for one or two cows, no inconvenience has been found to result, while a most important addition has thus been made to their means of subsistence. But the possession of a cow or cows by labourers is attended with other advantages: An appropriate employment is thus supplied to the female portion of their families, whom mechanical inventions have deprived of the facility which they formerly had of gaining their livelihood by knitting and spinning. Cheap and nutritious meals are afforded to persons of all ages, but more particularly children; and additional facilities are given for keeping pigs, which contribute not only to the immediate support of the

family but, together with the cows, supply the means of maintaining the land in good heart by the manure which is produced.

The peasantry throughout the country appear to possess very imperfect knowledge respecting the best mode of accumulating, preserving, and economizing manure, and some means for improving the practice upon this head appears necessary. During the last 50 years cottages in large numbers have been built in various parts of the country with little or no land attached to them, and even the land which formerly surrounded the antient dwellings of the poor has, in many instances, been taken away. Attention has however of late years been called to the destitute and helpless state of the peasantry, and it has been found, that from the circumstance of their having nothing which could call forth prudence and ingenuity, they were become reckless, devoid of skill, and incapable of taking care of themselves. For the purpose of improving them it has been reasonably considered that to make them careful they must have something to care for; to render them skilful they must be placed in circumstances which render the exercise of ingenuity necessary. All these objects are supplied by allotments of land, which are now daily becoming more common, although several serious difficulties to the immediate adoption of the system have to be encountered: a few of these difficulties we shall here enumerate:—

1stly. The builders and other speculators, to whom too many of the cottages in some of our rural districts belong, have built them close together in rows or streets, which renders it impossible for the allotments in such instances to surround the dwellings, a circumstance necessary in order that the cottager should derive full benefit from them. When the land surrounds the cottage the children may be occupied upon it without being removed from the mother's superintendence. The father, who, after a day's work, would hesitate about walking a quarter of a mile and back, may easily apply a little labour to his garden without separating himself from his family.

2ndly. The peasantry are ignorant of the value of allotments and the mode of cultivating them. These circumstances present difficulties which nothing but an early training in industrial schools arranged for the purpose can completely overcome.

3rdly. The farmers generally have strong prejudices against the system.

With regard to rent, it should be the fair value of the land, the same as would be paid by any other description of tenants. When allotments are given gratuitously they are lightly valued, and when let at too high a rent they cannot make a return to the labourer which will induce him to continue his exertions. It would seem that they should be let directly by the proprietor of the soil to the labourer, or the evils of the Irish system may be feared. The state of things in Ireland has been continually urged against the allotment system, but, as we think, without reason; for, 1stly., The Irish peasant depends almost wholly upon his allotment, looking to it, not as an auxiliary to his daily earnings, but as the total of his means of support; 2ndly., He is obliged by the competition for land to pay a rent which far exceeds the proportion paid by the tenants, and leaves him only a miserable pittance to subsist upon.

It has also been urged against the system of cottage allotments that it tends to encourage early marriages, and to the production of a race of beggars. That cottage allotments may have this effect is true, but the objection is mainly applicable, and perhaps has been mainly applied, to cottage allotments which are of such a magnitude as to render it impossible for the cottager to cultivate them without exchanging his character of a labourer for that of a farmer without adequate capital, or, as already observed, the objections apply to a state of society like that in Ireland. The multiplication of small farms is quite a different question from that of cottage allotments as here understood, and opinions can hardly be much divided as to the inexpediency of such increase.

Part of the objections also raised against cottage allotments will be removed by the improved administration of the Poor Laws.

It remains then to consider whether, under the actual circumstances of this country, the advantages above suggested, as likely to arise to the labouring man from the possession and cultivation of a small piece of ground attached to his dwelling, will not counterbalance all possible

disadvantages which have been suggested as likely to result from the system; whether in fact the possession of a small piece of ground, as here understood, will or will not tend to raise the standard of comfort which a labouring man and his children will enjoy; and whether, if such be the case, such possession will not have a tendency directly the opposite to that which has been imputed to the system of small allotments of land.

For further information upon this subject see the publications of the Labourers' Friend Society, and the evidence taken before a Committee of the House of Lords upon the subject of the Poor Laws in 1831. [GARDEN HUSBANDRY.]

COTTBUS, a circle lying on both banks of the Spree, in the southern part of the Prussian province of Frankfort-on-the-Oder. It has an area of about 334 square miles, and, by the census at the close of the year 1831 contained 42,000 inhabitants, an increase of 2110 since the year 1826. The northern parts consist in general of elevated moors; the southern, of sandy flats: there is an abundance of timber. Besides the Spree, this circle is watered by the Mala or Malcke, and a number of rivulets. There are several large ponds or natural expanses of water, such as the 'Devil's Pond,' south of Pictz, the royal 'Carp Pond,' near Bahrenbrück, &c. The chief pursuits of the inhabitants are agriculture and grazing; the principal products are rye, potatoes, flax and hemp, tobacco, chicory roots, wine, and fish. The stock, at the close of 1831, consisted of 3568 horses, 15,566 horned cattle, and 18,373 sheep and goats. Operative industry is almost wholly confined to the towns; and the principal manufactures are woollens, linens, stockings, tobacco and snuff, leather, spirits, and beer. There is an iron-work near Pritz, with a high-blast furnace and 5 hammers, and 3 boiling-houses for tar. Good ironstone and peat are found at Werben. Besides the chief town, the circle contains Pritz on the Mala and on the canal of the Spree, with about 2100 inhabitants and 124 villages. Cottbus, the chief town, lies on the left bank of the Spree, in 51° 45' N. lat. and 14° 22' E. long., and is surrounded by high and strong walls. Its population amounts to about 8200 (in 1817, 6437, and 1831, 8046): it contains 4 churches, a gymnasium, an orphan asylum, and 2 hospitals. The inhabitants are employed in the manufacture of woollens, linens, beer, and brandy. It is the seat of a considerable transit-trade between the Elbe and Oder, as well as between Stettin and the eastern parts of Germany.

COTTESWOLD HILLS, THE, traverse the eastern part of Gloucestershire, beginning on the north near Chipping Cambden, and terminating a short distance north of Bath. Their whole length may be somewhat more than forty-five miles. They are divided into the upper and lower Cotteswolds. The upper extend from Chipping Cambden to Stroud, running nearly from N.N.E. to S.S.W. about twenty-five miles, and contain the highest portion of the ridge. Broadway Beacon, near the northern extremity, rises to 1086 feet; Cleeve Hill, east of Cheltenham, to 1134 feet; and Symmonds Hall, not far from Stroud, is 795 feet above high-water mark. The hills in this part are three or four miles across, and include many small valleys, to which agriculture was formerly limited, but in modern times it has been carried to the very summits of the hills; though the higher situations are much exposed to cold winds. The lower Cotteswolds, between Stroud and Bath, extend about twenty miles nearly due north and south. They hardly rise anywhere to 500 feet, and constitute a high ground from one to two miles wide. By the flat hills east of Malmsbury the Cotteswolds are connected with the hilly country along the Channel. The waters which descend from the western declivity of the Cotteswolds, which is the steep side, fall after a short course into the Severn. Those which descend from the eastern declivity form the upper branches of the Thames. These hills contain no minerals except freestone and limestone.

COTTIN, SOPHIE RESTAUD, born in 1773, was brought up at Bordeaux by her mother, who was an accomplished and well-informed woman. At the age of seventeen she married Mr. Cottin, a wealthy Parisian banker, with whom she resided in the capital. Three years after, she lost her husband, which circumstance, added to the horrors of the revolution, induced her to retire to a cottage in the valley d'Orsay. To beguile her solitude she began to write a novel, 'Claire d'Albe,' which, notwithstanding the good intentions of the authoress, whose object was to point out the dangers of seduction, cannot be called moral, it being calculated to engage the sympathies in favour of the heroine,

who is guilty of adultery. This bad taste in morality, of making vice interesting, is common to many, and some of the best, French novels, such as Rousseau's 'Julie,' Madame de Stael's 'Delphine,' and many others: it has also spread to English literature, and infected not only novels but poetry. A person is represented with a thousand amiable qualities, and one single vice; or with one single virtue, and a thousand crimes; the result is the same in both cases: our sympathies are excited in favour of the guilty, which is not the best way of forwarding the cause of virtue. In Madam Cottin this was only an error of judgment and inexperience, for her heart was pure, and her sentiments and conduct strictly virtuous. It is said that the publication of 'Claire d'Albe' was owing to a feeling of benevolence. A person of her acquaintance being proscribed during the revolution, stood in need of money to effect his escape; Madam Cottin hastily offered the sheets, which she had been writing for her amusement, to a bookseller, and gave the produce to the fugitive. Some say that 'Malvina' was the work which served this benevolent purpose. The subject of 'Malvina' is a woman married to a confirmed libertine, whose conduct drives her to insanity, from which she recovers only to die in the arms of her repentant husband. Her third work, 'Amelie Mansfield,' although cleverly written, is exceptionable on the same grounds as 'Claire d'Albe.' Madam Cottin afterwards wrote 'Mathilde,' a tale of the Crusades, which had great popularity. The charm of Madam Cottin's writings consists in her description of the feelings of the heart in trying circumstances: she always excels when she describes those of virtuous unsophisticated persons, for she then drew from the source of her own pure feelings, but she does not succeed so well in painting bad and stormy passions and worldly intrigues, to which she was entirely a stranger. Her last and best work was 'Elizabeth, or the Exiles in Siberia,' the characters and sentiments of which are most unexceptionable, the action well conducted, and the termination satisfactory. A delightful atmosphere of pure and almost infantine innocence seems to attend the heroine throughout her task of filial devotion. 'Elizabeth' is accordingly a work which is generally put into the hands of young persons, and has been translated into most European languages. The subject is a young girl, who is living with her exiled parents in Siberia, and who forms and executes the resolution of proceeding to Moscow on foot to ask their pardon of the emperor. It seems that in the beginning of the reign of the late Emperor Alexander, there was a young person, called Praskowja Lupolowa, who actually performed this journey of more than 2000 miles, and obtained the object of her petition. Madam Cottin has worked upon this fact, and embellished it with all the charms of description. The account of Siberia, and of the mode of existence of the unfortunate exiles, is pretty exact, except in one or two cases, as where, for instance, she speaks of avalanches falling from the mountains in Siberia, which is one of the flattest regions on the face of the globe. But her novels must be judged of as works of imagination, and as such they rank high in French popular literature. The style of 'Elizabeth' is considered more carefully correct and finished than that of her other novels. Madam Cottin, who was a Protestant, and had attentively studied the Scriptures, had begun a work intended to demonstrate the truth of the Christian religion by its sympathy with the best sentiments and affections of the heart. She had also begun a work on education. She did not live to finish either: she died in August, 1807, at the age of thirty-four, sincerely regretted by all who knew her. Her extreme modesty and total absence of ambition made her shrink from rather than court popularity and fame: most of her works were published anonymously. They have been since collected and published at Paris, in 5 vols. 8vo., 1817.

COTTON, a word derived from *Kutn*, or *Kutun*, one of the names given by the Arabs to this substance, is a filamentous matter produced by the surface of the seeds of various species of *Gossypium*. [GOSSYPIMUM.] It consists of vegetable hairs, of considerable length, springing from the surface of the seed-coat, and filling up the cavity of the seed-vessel in which the seeds lie. Hairs [HAIRS] are extremely common on the surface of plants; frequently however they are unobserved, in consequence of their small number and minuteness; while on the other hand in some cases they give plants, such as the Mullein for instance, a remarkably hoary appearance. On the surface of seeds

they are uncommon; and yet in the Malval alliance, to which the cotton plants belong, they not only exist abundantly on the seeds of that genus, but in several other species. Vegetable hairs are one of the many forms in which the cellular substance of vegetation is developed, and they consequently partake of two of the great characteristics of that form of tissue, namely, thinness and transparency. In the cotton they are long weak tubes, which, when immersed in water and examined under the microscope by transmitted light, look like flat narrow transparent ribands, all entirely distinct from each other, and with a perfectly even surface and uniform breadth; it is only occasionally that any appearance of joints is observable in these hairs, and when this happens the articulation is formed by a line, perpendicular, or nearly so, to the side of the tube. Sometimes a slight trace of fine grains is discernible in the interior, but more frequently the hairs seem empty; if strained singly they have little strength and readily break, and it is only when many are entangled together that they acquire any appreciable degree of strength. In all these points cotton differs from the vegetable matter that constitutes linen; the latter consists of woody tissue, in the state of long tubes, but is at once distinguished by the tubes adhering in bundles, which it is difficult under a microscope to break up into their component parts; the tubes are thick-sided, and will not acquire a riband-like appearance when viewed in water, but rather resemble extremely minute thermometer tubes. When they are jointed together the articulation is oblique, the ends of the tubes being pointed and overlying each other; and finally, in each particular tube of the woody tissue, delicate as it may be, there is a sufficiently appreciable degree of toughness when an attempt is made to break it. In short, cotton is a development of the parenchymatous part of the *gossypium*; linen is a form of woody matter; hence it is easy to distinguish with certainty linen from cotton manufactured articles, in cases of doubt; and hence also the well-known superiority of linen to cotton in strength: the latter is manufactured from the most delicate part of plants, the former from the toughest.

Cotton is produced by many different species and varieties of the genus *Gossypium*, under which article their differences, or at least what is known of them, will be explained. In this place a general description of the genus will be sufficient.

It consists of herbaceous, or nearly herbaceous plants, varying in height from three or four to fifteen or twenty feet, according to the sort; sometimes the branches become woody, but they always partake very much of the herbaceous character. The leaves are downy and more or less lobed, being sometimes however near the top of the stem undivided; at their base is seated a pair of awl-shaped stipules. The flowers are either yellow or dull purple, and have the ordinary structure of the Malvaceous family; each is surrounded by three heart-shaped bracts, which are more or less lacerated. The calyx is a bluntly five-toothed cup. The seed-vessel is a capsule opening into from three to five lobes, and then exposing many seeds enveloped in cotton, which sometimes adheres to them so firmly that it is separated with difficulty; sometimes it parts freely from them; in some sorts it is long and in others comparatively short, giving rise to the commercial names of long staple and short staple.

The sorts of cotton-plants are extremely numerous, but never having been critically and comparatively examined, they are in great confusion. And yet it is a point of the first consequence to ascertain the exact nature of their differences, and to name them with rigorous precision; for it is thus only that knowledge can be acquired of the kinds that yield the numerous qualities of cotton now in the market, and that the cultivator can be enabled to improve his plantations. But, as Professor Royle has very correctly observed, 'there are great, and in some respects insurmountable difficulties, as botanists have generally neglected the subject, and omitted mentioning the cultivated species; while cultivators have used provincial names, or applied new ones of their own, to the exclusion of any notice of the names in use among botanists. This has rendered it impossible for others to ascertain to what species their otherwise valuable observations refer. The celebrated De Candolle has admitted thirteen species, observing that they are all uncertain, and that no genus more requires the labour of a monographist; two additional species have been described by Dr. Roxburgh, one by Rausch, and another in the *Flore de Sénégambie*. Dr. Von Rohr describes twenty-nine species or varieties,

Mr. Badier eighteen, and Mr. Bennet mentions that he knew more than 100 kinds, and that they appeared to him never-ending.' Mr. Royle himself fixes the supposed species, as far as he could determine them, at eight.

This is certainly not creditable to the managers of colonial gardens; it says little for the good sense of the superintendents of those establishments, where alone the subject can be investigated, that there should not to this hour be even one good series of experiments, except Dr. Roxburgh's, upon record, regarding a plant of such immense importance as cotton. In the West Indies there have been public botanic gardens at Jamaica, St. Vincent's, and Trinidad; the last at least remains. In that situation all the varieties of cotton from the islands and the main land of America might be cultivated side by side, and in the East no place could be more favourable for the comparison of all the sorts found in India and Africa than the botanic garden of the Mauritius. The results could without difficulty be accurately compared, and in six or seven years this great desideratum in commercial knowledge might be supplied.

Cotton-plants are found wild in both the old and new world. Herodotus and Arrian speak of the cotton-plant as indigenous in India, and the linen found in Peruvian tombs sufficiently attests its having existed in that country long before it could possibly have been carried to America by eastern intercourse. In fact the wild American cotton-plants are specifically different from those of the old world; but at the present day the cotton of the West is cultivated in Asia and Africa, while that of the East has long since been introduced to the American plantations.

The situations in which cotton-plants have been advantageously cultivated are included between Egypt and the Cape of Good Hope in the Eastern, and between the southern banks of the Chesapeake Bay and the south of Brazil, in the Western hemisphere. It has not been found to succeed beyond the parallels that limit those countries. In the equinoctial parts of America Humboldt found it at 9000 feet elevation above the sea; in Mexico as high as 5500 feet; and Professor Royle saw it at the elevation of 4000 feet in the Himalaya. It seems generally to prefer the vicinity of the sea in dry countries, and the interior districts of naturally damp climates: thus, while the best cotton is procured in India from the coast of Coromandel, or other maritime districts, and in the southern states of the American Union from certain coast-islands, the coast cotton of Pernambuco is inferior to what is produced in the interior of that country. These facts lead to the inference that it is not merely temperature by which the quality of cotton is affected, but a peculiar combination of heat, light, and moisture; the most favourable instance of which may be assumed to be the coast of Georgia and the Carolinas, and the worst to be Java and the coast of Brazil.

That this should be so, would, in the absence of positive evidence, be probable, considering the nature of cotton. We have seen that it is a hairy development of the surface of the seed; and nothing in the organization of plants is more affected by the situation they live in than their hairs: thus scarcely any water-plants have hairs, except in a slight degree, while the same species transferred to a dry exposed station is closely covered with such organs, and *vice versa*. The quantity of hair is also affected in an extraordinary degree by local circumstances. The Venetian sumach plant, when in flower, has its flower-stalks nearly naked; a large proportion of the flower-stalks has no fruit, and becomes covered with very copious long hairs, whence the French call this plant *Arbre à perruque*; but those flower-stalks which do bear fruit remain hairless. In this case the local cause is the abundant food thrown by the system of the sumach-plant into the flower-stalks for the nourishment of the fruit; and the fruit not forming, the food intended for it is expended in the formation of hairs upon the surface of the flower-stalk: this is a local circumstance that may be referred to the class of accidents. But local circumstances conducive to the formation of cotton in excess may be permanent, and derived from the situations in which the plants grow. In a damp cloudy climate the food procured from the soil may not be concentrated upon the surface of the seed, but may be expended in the production of excessive quantities of leaves, and of proportionally few flowers; or it may pass off into the atmosphere in the form of mere exhalation, a small proportion only being consolidated; or in a dry climate the soil may not be able to furnish food enough to the plant out of which to form more cotton than it is absolutely its specific property to produce

under any circumstances. Or, lastly, there may be a mean where the powers of vegetation are called into their utmost activity by warmth and abundant food, and where, nevertheless, the dryness of the atmosphere and the brightness of the sun, constantly acting upon the surface of the cotton pods (seed-vessels), may drive back the juices from the surface of the latter to that of the seeds, and thus augment the quantity and improve the quality of the cotton itself: this may explain the action of climate upon this substance.

The question is however rather more complicated; the different specific qualities of different varieties of the cotton-plant must be also taken into account. It has already been seen that a considerable number of varieties of cotton is certainly cultivated, although so little is correctly known about them. In some of them the cotton is long, in others it is short; this has it white, that nankeen-coloured; one may be cultivated advantageously where the mean winter temperature does not exceed 46° or 48°, and another may require the climate of the tropics. This is just what happens with all cultivated plants. Some vines will produce only sweet wine, others only hard dry wine, and some are suited only to the table; some potatoes are destroyed by a temperature of 32°, while others will bear an average English winter; only one kind of wheat produces the straw from which the fine Leghorn plait for bonnets is prepared. But to multiply such instances is unnecessary. There can then be no doubt that the quantity of cotton will depend upon climate in part, and upon the specific properties of different varieties also in part.

For further information and numerous details upon this subject, we refer the reader to a very important dissertation upon the cotton cultivation of India, by Professor Royle, in his *Illustrations of the Botany and other branches of the Natural History of the Himalayan Mountains, and of the Flora of Cachmere*, article 'Malvaceæ.'

The Cotton-plant, or *Gossypium*, must not be confounded with the Cotton-tree, *Bombax*, or *Eriodendron*; the latter has also cottony seeds, but they cannot be manufactured.

COTTON CULTIVATION AND TRADE. Cotton is called, in French, *Coton*; German, *Baumwolle*; Dutch, *Katoen*, *Boomwol*; Danish, *Bomuld*; Swedish, *Bomull*; Italian, *Cotone*, *Bambagia*; Spanish, *Algodon*; Portuguese, *Algodao*; Russian, *Chloptschataja Bumaga*; Polish, *Bawelna*; Hindustani, *Rûhi*; Malay, *Kapas*; Latin, *Gossypium*.

The distinctive names by which cotton is known in commerce are, with the following two exceptions, derived from the countries of their production. The finest kind, which commands the highest price, is called sea-island cotton, from the circumstance of its having been first cultivated in the United States of North America, in the low sandy islands on the coast, from Charleston to Savannah. It will not flourish at a distance from the sea, and it is said that its quality is gradually deteriorated in proportion as the plants are removed from 'the salutary action of the ocean's spray'; it succeeds only in South Carolina, Georgia, and Florida. This cotton is composed of filaments longer than those of any other description, which circumstance, joined to its even and silky texture, fits it for the production of the finest yarns. The seed is black, and in the southern states of North America it is thence frequently called 'black-seed cotton,' to distinguish it from the short-staple cotton produced in the interior of those states, and which, from a like natural cause, is distinguished as green-seed cotton. The seed of the sea-island cotton is sown every year; but the plant when cultivated within the tropics will live and yield harvests for several years in succession. It is supposed to have come originally from Persia. It was taken from the Island of Anguilla to the Bahamas for cultivation, and was first sent thence to Georgia in 1786: it is not said how the seed found its way to the little island of Anguilla: the annual average crop does not exceed 11,000,000 pounds.

Upland or Bowed Georgia cotton, the green-seed kind, has received its name of *upland* to distinguish it from the produce of the islands and low districts near the shores. The expression bowed was given as being descriptive of the means employed for loosening the seed from the filaments, which was accomplished by bringing a set of strings, attached to a bow, in contact with a heap of uncleaned cotton, and then striking the strings so as to cause violent vibrations, and thus open the locks of cotton and cause the seeds to be easily separable from the filaments. The remaining kinds of cotton now brought to English markets are distinguished

by names so plainly descriptive of the countries of production, that it is not necessary to offer any description of them with that view.

The materials for the early history of the cultivation and use of cotton are very scanty. In India and many of the islands in the Indian Ocean, the plant has been cultivated, and its filaments have been spun and woven, from time immemorial. In Mexico the Spaniards found cotton cloths in common use at the time of their conquest of the country. The Egyptians were acquainted in the time of Pliny with the use of cotton; but the manufacture of textures of this material must have been introduced among them at a period not so remote as the æra which produced many of the remains of that people which have been handed down to us. Such mummy-cloths as have been submitted to microscopic examination are all linen; and while delineations of the flax plant are commonly found in Egyptian paintings, none of the cotton shrub has been discovered. It is said that the cotton plant was very early known in China, and cultivated as an ornamental garden shrub, but that its filaments were not brought to use until the thirteenth century of the Christian æra, when its cheapness, as compared with wool and silk, caused it to rival those products, notwithstanding the opposition offered to its introduction through the generally unchanging habits of the people. More than 300 years before the date just mentioned, the plant was cultivated and its produce made into clothing in Spain under the dominion of the Moors. At that time the manufacture of cotton cloths was carried on extensively at Seville, Cordova, and Granada. In the Island of Sicily, then in possession of the Saracens, the cotton plant was cultivated. The mutual repugnance to each other of the Mohammedans and Christians was doubtless the cause of this valuable plant not having been usefully known at that period in other parts of Europe. The manufacture of cotton goods is said to have existed in Italy at the beginning of the fourteenth century; but there appears so much confusion in the names and description of the various tissues then known in commerce, that it is not possible to speak with much confidence on the subject.

It is not until towards the middle of the seventeenth century that we find any distinct mention made of the cotton manufacture as being carried on in England, although it has been shown by Mr. Baines that *cotton wool* was brought hither from the Levant and manufactured in Manchester at a somewhat earlier period.

The limited degree and the mode in which cotton was used for the production of tissues in this country, up to the time of Arkwright, has already been shown in this work. [ARKWRIGHT.] The cotton goods of which mention is made in the early history of the manufacture were mixed goods, of which the warp was composed of linen and only the weft of cotton, the mode of spinning then in use not giving sufficient strength to fit the latter for being used as warp. This difficulty was surmounted by the invention of Arkwright, whose first patent was obtained in 1769, from which time cotton fabrics have been made exclusively with that material. The progress of the manufacture did not at first give promise of the rapid extension which it afterwards exhibited. In 1764 the quantity of cotton imported was 3,870,392lbs., and the annual average from 1771 to 1775 did not amount to one million of pounds beyond that quantity. In the five following years the annual average quantity was no more than 6,766,613; but in 1790 the quantity used was 30,603,451lbs., and at this rate the manufacture continued stationary during the remainder of the century if the yearly average is taken. In 1800, the last year of the last mentioned series, the quantity was above 50 millions of pounds. From that time until the close of the war, in 1814, the advance of the manufacture was unimportant, the annual average consumption being 66 millions of pounds; but with the return of peace an extraordinary impulse was given to the trade, and the annual average consumption of cotton, taken in periods of five years, has been as follows:—

1815 to 1819	118,267,611 lbs.
1820 to 1824	152,201,824 „
1825 to 1829	205,665,011 „
1830 to 1834	280,918,826 „

And in 1835 the consumption was, 326,407,692 „

The following statement of the production of cotton in various parts of the world, at different periods during the past half century, is taken from a collection of 'tables and notes on the cultivation, manufacture, and foreign trade of cotton,' compiled by order of the American congress, and presented to the House of Representatives by Mr. Levi Woodbury, the secretary of the United States' treasury. These tables appear to have been compiled with great care and industry, and they present the most complete view of the subject which has hitherto been offered. The following table, in which round numbers are used, must evidently be taken as only an approximation to the truth.

Years.	United States of America.	Brazil.	West India Islands and Colonies.	Egypt.	Other parts of Africa.	India.	Other parts of Asia.	Mexico and South America (exclusive of Brazil).	Other parts of the World.	Total production of Raw Cotton.
	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.	lbs.
1791	2,000,000	22,000,000	12,000,000	..	46,000,000	150,000,000	190,000,000	68,000,000	..	490,000,000
1801	48,000,000	36,000,000	10,000,000	..	45,000,000	160,000,000	150,000,000	56,000,000	15,000,000	520,000,000
1811	80,000,000	35,000,000	12,000,000	..	44,000,000	170,000,000	146,000,000	57,000,000	11,000,000	555,000,000
1821	180,000,000	32,000,000	10,000,000	6,000,000	40,000,000	175,000,000	135,000,000	44,000,000	8,000,000	630,000,000
1831	385,000,000	38,000,000	9,000,000	18,000,000	36,000,000	180,000,000	115,000,000	35,000,000	4,000,000	820,000,000
1834	460,000,000	30,000,000	8,000,000	25,000,000	34,000,000	185,000,000	110,000,000	35,000,000	13,000,000	900,000,000

The cultivation of cotton has lately become an object of attention in Peru, and it appears probable that considerable supplies may be sent thence to Europe. The plant may be successfully cultivated along the whole coast of Peru. The quality of the produce is said to be equal to that of Upland Georgia cotton, some shipments made in 1835 having sold at the same price as Georgia cotton. The quantity exported from Peru in that year was 800,000 lbs.

A further table is given by Mr. Woodbury, showing the distribution of cotton at various periods from 1770 to the present time. It may suffice to give these particulars for one year (1834); the difference between the quantities produced in and exported from the different countries represent the probable consumption in the places of cultivation.

Exports from the United States to England	266,750,000 lbs.	lbs.
" " " to France	79,900,000	
" " " to other places	20,000,000	
Total from the United States	366,650,000	
Exports from India to England	32,000,000	
" " " to China	40,000,000	
Total exports from India	72,000,000	
Brazil to England	18,000,000	
West Indies to England	4,000,000	
Brazil and West Indies to France	4,000,000	
Egypt and Turkey to England	1,500,000	
" " " to France	7,000,000	
	lbs. 473,150,000	

It appears from the foregoing figures that rather more than two-thirds (68 per cent.) of all the cotton sent away from the places of production are shipped to England. It is further remarkable, that while the production of this article has increased in the United States until it now equals the production of the whole world as it existed in 1770, the quantity grown in all other countries, with the exception of India and Egypt, has materially decreased. This result has been attributed to various causes, among which may be mentioned the good quality of American cotton, the low price of land there, and the great improvements that have been made in cleaning the cotton from its seed by means of Whitney's saw-gin, introduced in 1793. It is evident however that the greater part of these advantages might have been shared by many other countries in which the soil and climate are equally favourable for this branch of husbandry: and it will probably be more in agreement with the fact if we attribute the success of the American planters to their greater intelligence and industry, seconded by the commercial enterprise by which their country is characterized.

During the period in which the increased production has been going forward with the greatest rapidity in America, the prices have been continually declining. In the table of prices given by Mr. Woodbury as those of

the United States, at the places of exportation, and including all kinds of cotton, it is shown that the average price of each period of five years, from 1791 to 1835, has been as follows, viz.:—

per lb.	per lb.	per lb.
1791 to 1795...15½d.	1806 to 1810... 9½d.	1821 to 1825...8d.
1796 to 1800...18½d.	1811 to 1815... 7½d.	1826 to 1830...5d.
1801 to 1805...12½d.	1816 to 1820...13d.	1831 to 1835...6d.

The higher prices obtained in the earlier years of this series must not be taken altogether as the measure of the planters' gains; but there can be no doubt that those gains were sufficiently great to stimulate production; and if the estimates obtained from Mr. Woodbury's tables and other sources are to be relied on, there is no reason to fear that the market value of their produce is yet so far reduced as to check the extension of cotton cultivation in the south-western states, and prevent it from keeping pace with the increasing demands of European manufacturers. 'Where rich lands and labour were low, as in Mississippi and Alabama a few years ago, two cents (one penny) per pound for cotton in the seed, or eight cents when cleaned, would pay expenses. It is supposed to be a profitable crop in the south-western states, at ten cents per pound.' (Woodbury's *Tables*, &c., page 17.) An American gentleman, Mr. Joshua Bates, who is a partner in the house of Baring and Co., stated in his evidence before the Select Committee on Manufactures, Commerce, &c., in 1833, that 'it is understood that even six cents or three-pence per pound is a price at which the planters can gain money in the valley of the Mississippi.'

Bengal cotton of inferior quality can, it is said, be raised for three half-pence per pound, and delivered in England at an advance of one penny upon that price. Good Surat cotton is said to cost two-pence half-penny per pound, delivered at Bombay. The cost of production in our West India colonies is considerably greater, and the cultivation of cotton has consequently been for the most part abandoned by the British planters.

Land fresh brought under cultivation in the United States will yield on an average from 1000 to 1200 pounds per acre of cotton with the seed, which will yield of clean cotton from 250 to 300 pounds. In the old states, the produce is not more than one-half this quantity. One able-bodied labourer is sufficient for each eight acres of land, if assisted in the lighter part of the work by the aged and infirm, and the young people who belong to their families; the whole will, at the same time, be able to cultivate from five to eight acres of provision ground. The proportion of able-bodied labourers in each 100 of the entire working population of the cotton-growing districts in America is 32; the proportion of young persons not yet arrived at their full strength, and of elderly people still capable of some degree of labour, is 25; the remaining 43 are composed of children under fourteen years of age, and superannuated persons, none of whom are capable of any but very light work, such as weeding and picking the cotton. Captain Basil Hall has given the details of a plantation where 200 acres were under cotton cultivation, on which the entire number of negroes was 122; of these 48 were children under fourteen, and four were wholly superannuated. Of the remaining 70 only 39 were considered 'full hands,' 16 were 'three-quarter hands,' 11 'half-hands,' and 4 'quarter-hands,' the whole being equal to 57½ able-bodied labourers. This proportion of labourers is greater than that first stated of one able-bodied labourer to eight acres, which rests upon the authority of Mr. Woodbury's tables. On the same authority we are told that the whole quantity of land cultivated for cotton in the United States at this time (1836) should be estimated at two millions of acres; that the capital employed for the purpose is from 800 to 900 millions of dollars; and that the whole number of persons who are engaged in field labour, picking, and otherwise assisting in the cultivation of cotton, and raising their own provisions, is about 680,000. If to these are added the aged, the infirm, and the very young children composing the families of the labourers, 'besides overseers, owners, and their respective families dependent on the cotton crop, it is presumed that a million of persons are now engaged in the growing of cotton in the United States.'

The relative value of the kinds of cotton more commonly introduced for sale and use in this country, will be seen in the following list of prices quoted by the brokers of Liverpool, the greatest cotton market in this kingdom, or indeed in the world, on the 13th January, 1837.

	s.	d.	s.	d.	
Sea Island	2	1	to	3	0 per lb.
Demerara and Berbice				1	1
Egyptian	0	11½		1	4½
Pernambuco and Ceara	0	10½		1	1

Maranham	0	10		1	0½
Mobile and Alabama	0	7½		0	11½
New Orleans	0	7½		0	11½
Upland Georgia	0	7½		0	11
Common West India	0	10		0	11½
Surat					
Madras					

More than four-fifths of all the cotton brought into the United Kingdom is of the growth of the United States of America. The importations during 1835 were:—

From Egypt and ports in the Mediterranean

East India Company's territories	5,181,017 lbs.
British West Indies	41,429,011
Brazil	1,815,270
United States of America	24,986,409
Other places	284,455,812
	5,835,444

Total 363,702,963

The growth of this trade has been rapid beyond all commercial precedent. In 1786 the total imports were somewhat less than 20,000,000 pounds, no part of which was furnished by North America. Our West India colonies supplied nearly one-third, about an equal quantity was brought from foreign colonies in the same quarter, 2,000,000 pounds came from Brazil, and 5,000,000 pounds from the Levant. In 1790 the importations amounted to 31,447,605 pounds, none of which was supplied by the United States. In 1795 the quantity was only 26,401,340 pounds. In this year a commercial treaty was made between the United States of North America and Great Britain, by one article of which, as it originally stood, the export was prohibited from the United States in American vessels of such articles as they had previously imported from the West Indies. Among these articles cotton was included, Mr. Jay, the American negotiator, not being aware that cotton was then becoming an article of export from the United States. In 1800 the imports had more than doubled, having reached 56,010,732 pounds. This was the first year in which any considerable quantity was obtained from America; the imports from that quarter were about 16,000,000 pounds. The progress of this trade during the present century is shown by the following table, exhibiting the imports at intervals of five years:—

	From all places.	From the United States.
1805	59,682,406 lbs.	32,500,000 lbs.
1810	132,488,935	36,000,000
1815	99,306,343	45,666,000
1820	151,672,655	89,999,174
1825	228,605,291	139,908,699
1830	263,961,452	210,885,358
1835	363,702,963	284,455,812

The quantities actually employed in our manufactories in different years during the same period and at equal intervals have been as under:—

1800,	51,594,122 lbs.	1820,	152,829,633 lbs.
1805,	58,878,163	1825,	202,546,869
1810,	123,701,826	1830,	269,616,640
1815,	92,525,951	1835,	326,407,692

The rapid extension thus shown has altogether resulted from the inventions of Hargreaves, Arkwright, Crompton, and others, in spinning machinery, and more recently from the invention by Dr. Cartwright, since perfected by other mechanicians, of the power-loom. But for these inventions it would have been impossible for our artizans to have competed successfully with the spinners and weavers of India, from which country we previously received our supply of muslins and calicoes. The wonderful proficiency of the Hindus in this branch of manufacture and the low rate of wages among them have, by means of our inventions, been so completely overcome, that not only have we ceased to import for use the muslins of India, but have for many years sent great and continually increasing shipments of those goods to clothe the natives of India. These shipments were quite inconsiderable until the partial opening

of the trade with India in 1814, in which year our looms supplied 818,202 yards of cotton goods to India. Two years afterwards the shipments were doubled. In 1818 they amounted to about 9,900,000 yards, and from that time the shipments have increased so greatly, that in 1835 the markets of India and China took from us 62,994,489 yards, the declared value of which amounted to 1,660,806*l.*, exclusive of 8,233,142 lbs. of cotton yarn, valued at 603,211*l.* Considerable shipments of cotton piece goods are still made from India to this country, but nearly the whole are re-exported.

It is owing to the low price of our manufactures, more perhaps than to their comparative excellence in other respects, that this commercial revolution has been brought about. The hand-spun yarns of India, produced as they are from cotton of a quality inferior to that employed in our factories for the finer kinds of fabrics, are more durable and are capable of being converted into cloths more curiously fine than have hitherto been woven in England; but so great is the economy attained in the various processes of our manufacture, that this advantage of durability has been more than counterbalanced.

The quantity of cotton manufactured in various countries, as given in Woodbury's Tables for the year 1833, was as follows:—

England	284,500,000 lbs.
France	87,000,000
United States	80 to 85,000,000
India and China	242,000,000
Mexico and South America, including Brazil	35,000,000
Germany	36,000,000
Turkey and Africa	42,000,000
Spain	10,000,000
Prussia	20,000,000
Elsewhere	40,000,000

The number of persons employed in and connected with the cotton manufacture, and the number of spindles in use in some of these countries, is stated in the same tables as follows:—

		Persons.	Spindles.
England	1833	1,500,000	9,500,000
United States	1831	200,000	1,750,000
France	1834	600,000	3,250,000
Switzerland	1824		259,200

It has been computed that the produce of thirty-seven spindles is required for the supply of one loom; but this proportion partly depends upon the fineness of the yarn, and is not applicable where power-looms are used, the quantity of cloth woven in these being greater than that made in hand-looms in the proportion of five to two. The number of power-looms used for weaving cotton at the end of the year 1835, in the United Kingdom, was 109,626, of which 90,679 were in England, 17,531 in Scotland, and 1,416 in Ireland. The number of persons employed in cotton factories in the same year was 220,134. The proportions in the three divisions of the kingdom were:—

	Males.	Females.	Total.
England	88,327	94,916	183,243
Scotland	10,529	22,051	32,580
Ireland	1,639	2,672	4,311
	100,495	119,639	220,134

These numbers do not include persons employed in the processes of dyeing and printing, hand-loom weavers, stocking-knitters, nor makers of bobbin-net.

The first cotton-mill built in the United States was set to work in Rhode Island in 1790. Attempts had been made in the previous year 'to get the machinery into operation by water, by means of models for carding and spinning, which the state of Massachusetts had procured from abroad; but no mill was begun until the autumn of 1789, when one was commenced by the assistance of Mr. Slater, who had then recently come from England. About this time a cotton-mill was erected at Beverley, Massachusetts, by an incorporated company.'

The manufacture made at first so little progress in the United States, that up to 1808 not more than 15 spinning mills had been erected. There was a great increase in 1812, occasioned by the war between England and America; again from 1820 to 1825 much capital was applied to this object, and a further extension of the manufacture was

made in 1831 and 1832; in the first of which years we have seen that, according to Mr. Woodbury, the number of spindles in use in the United States was between one-fifth and one-sixth of the number used in this country. The great demand for cotton goods within the States has hitherto prevented any very considerable exportation; the total annual value of the shipments made between 1826—previously to which year the official tables are silent as to any exports—and 1832, was under 250,000*l.* In 1833 the value is given at 2½ millions of dollars (520,000*l.*), and in 1834 at 2,200,000 dollars (458,000*l.*). The greater part of these shipments were made to Mexico and the South American states.

The quantity of cotton imported into France in 1787, the earliest year as to which any returns are given, was 4,466,000 kilogrammes, or not quite ten millions of pounds; and it was not until after the return of peace that any decided augmentation occurred in this branch of industry. In 1815 the importation of cotton was 16,414,606 kilogrammes—36 millions of pounds; in 1820 it had reached 20,000,000 kilogrammes; in 1825 it was still below 25 millions; in 1830 it amounted to 29¼ millions, and in 1833 reached 35,609,818 kilogrammes (78½ millions pounds). In the same years the weight and value of cotton goods exported from France were as follows:—

	Kilogrammes.	Francs.
1787	4,466,000	21,227,200
1815	16,414,606	8,698,840
1820	20,000,000	29,120,058
1825	24,000,000	43,190,495
1830	29,000,000	55,636,150
1833	35,609,818	57,007,133

If we compare the quantities here stated for 1833 with the consumption of our own factories and the shipments made from the United Kingdom in the same year, it will be seen that the quantity of cotton spun in France was equal to, or rather more, than one-fourth of that used in our mills, and that the value of the exports from France was not quite equal to one-eighth part of the value of the shipments from England.

The only other country in which the cotton manufacture is prosecuted with a view to the supply of foreign markets, is Switzerland. The entire and absolute freedom of trade allowed throughout the Swiss cantons prevents our giving any statement of the quantity of the raw material at any time imported, or of manufactured goods exported. The cotton manufacture is of modern introduction: the first spinning machine was established at St. Gall, in the year 1800; but Switzerland still imports considerable quantities of foreign-spun yarns for the use of her hand-loom weavers, as well as of power-loom cloths from England, which are dyed and printed, and afterwards exported. Finding themselves shut out from the greater part of the markets of Europe by heavy duties and prohibitions, the merchants of Switzerland have directed their attention to the supply of North and South America, and partially of India also. The perfection to which dyeing and cotton-printing have been brought in the cantons gives them great advantages. So great is the degree of perfection attained in the application of the colour denominated Turkey red, that calicoes and prints of that colour are imported from Switzerland into England: the same may be said of embroidered muslins.

The cotton manufacture is the most generally diffused of all the branches of industry upon which the production of clothing depends. The greater part of the countries in which it is carried on limit their production of cotton goods to the wants of their own people. The perfection to which the spinning processes have been carried in this country has made the greater part of the world in some measure dependent upon our cotton mills for the finer descriptions of yarns; and a sufficient indication of the universality of cotton-weaving may perhaps be afforded by inspection of the table given under the head of COTTON MANUFACTURES, and which contains a statement of the quantities of different descriptions of cotton fabrics, and of twist and yarn, exported from the United Kingdom during the year 1835.

COTTON SPINNING. Among all the ancient mechanical arts there were few so simple as that of converting the downy filaments of the cotton plant into a continuous thread according to the methods generally used before the time of Hargreaves and Arkwright, and which methods are still employed in eastern countries. There are, on the other hand, few processes for the performance of which the

inventive powers of man have, since that period been more taxed, in this country and during this age of invention, than for the cheap and perfect production of cotton twist and yarn.

The use of the spindle and distaff was superseded in England by the spinning-wheel, in or soon after the reign of Henry VIII. The next improvements in this useful art were those of Hargreaves and Arkwright, the introduction of which is noticed under the head COTTON MANUFACTURES. Since that time the inventions by which the art of cotton-spinning has been advanced in this country have been so numerous, that a large volume would hardly suffice for their full explanation; all that can here be attempted is a description of the various processes now in use in the best regulated cotton-mills of Lancashire, and a summary notice of the more striking effects which have resulted from their introduction.

Owing to the great variety generally found in the quality of different bags of cotton, which would otherwise occasion a corresponding difference in the quality of the yarn produced, the contents of several bags are mixed together in a heap. This is done by spreading out the contents of each bag in a horizontal layer of uniform thickness, the contents of the several bags forming separate layers and resting one upon the other, so that the number of layers corresponds to the number of bags. In making this heap, which is called a *bing* or *bunker*, the several layers are to be trampled or pressed together somewhat in the manner of building a hay-stack. The cotton of which the bing is composed is then torn down by a rake from top to bottom. It is evident that in its progress a portion of each horizontal layer will be brought away, and that thus, if the work be skillfully done, the contents of the different bags must be collected together in a mass of uniform quality.

It is customary to mix in this manner different descriptions of raw cotton for the production of various qualities of yarn, and some skill on the part of the manufacturer is called for in order to produce a mass that will answer the intended purpose at the least possible cost. The practice of different spinners varies much in this respect, but it is considered proper as a general rule to mix together only such qualities as are similar in the length of their staple. The waste cotton produced in the previous operations of the mill are mixed in the bing in certain proportions for making the lower qualities of yarn. For the higher numbers, and for twist which is used for warp, finer qualities of cotton are required than for low numbers or for weft.

The scutching machine is used to open the locks of cotton and separate its fibres, while at the same time it separates from it any sand or seeds which it may contain. This machine consists of feeding-rollers made of wood and placed at a short distance from each other, through which the cotton is made to pass slowly, after passing through which it is struck by a set of beaters made to revolve 1600 or more times in a minute. The cotton is thus passed through two sets of rollers, and subjected to two sets of beaters. It is then taken to the spreading-machine, the use of which is to spread a given weight of cleaned cotton into a given length and breadth, in order to its being presented of uniform thickness to the next machine—the carding-engine. The spreading-machine is not universally used. Where the heavier quality of yarn is spun it answers sufficiently well, and effects an adequate saving of labour, but for fine yarns, where the greatest precision is required in order to produce regularity in the size of the yarn, machine-spreading does not answer so well as hand-spreading. The cotton must be weighed very accurately before it is put into the spreading-machine, and when perfectly spread is called a *feed*, the thickness of which will of course be regulated by the weight of cotton supplied to the machine. This operation is repeated continuously, so that an unbroken sheet of cotton passes through the machine and is wound on a wooden roller. In this form the cotton is called a *breaker lap*, and is then ready for the carding-engine.

Up to this stage the fibres of the cotton cross each other in every direction. The use of the carding-engine is to disentangle them, to draw them out and to lay them parallel to each other: properly speaking, this is the first operation of spinning, the previous processes being used only to open and clean the cotton. The card is a species of brush made of short wires passed through a sheet of leather and pointing all in one direction. In the early period of cotton-spinning in this country, these cards were nailed on small pieces of board with handles, and two of them were used

together, one held in each hand. The first improvement made in this implement was effected about 1760, by James Hargreaves, who, a few years later, invented the spinning-jenny. This improvement in the cards consisted in having one of them greatly increased in size, and fixed; this was called the stock, and the other was suspended by a cord working in a pulley, fixed to the roof of the chamber; the effect of this arrangement was that two or more cards could be applied to the same stock. This modification was immediately followed by the greater improvement of cylinder cards; the father of the late Sir Robert Peel set up a machine of the kind at Blackburn in 1762, with the assistance of Hargreaves. The inventor of cylinder cards is not known with certainty. Mr. Baines ascribes the invention to Lewis Paul, who took out a patent in 1748 for improvements in carding. The carding-engine consists of a horizontal cylinder covered in its entire circumference with narrow fillet cards wound spirally round the cylinder, leaving an intervening space between the several spiral lines thus described on the surface of the cylinder. Over the cylinder is a concave frame, the interior surface of which is lined with cards, and the form of which corresponds to that of the cylinder. When the cylinder is made to revolve, the cards on it and on the frame work against each other, by which means the fibres of cotton are disentangled and properly arranged, as already mentioned. The cylinders, which are usually about 3 feet in diameter, and 3 feet long, are made to revolve at the rate of about 110 revolutions in a minute.

The cotton, in the form already described as a *breaker lap*, is led into the carding-machine by a slow motion through feeding-rollers, one inch in diameter, which revolve only twice in a minute. The fibres of the cotton are then immediately engaged by the wires of the main cylinder, and after being by their means properly arranged, are thrown off by its velocity to a second cylinder called a *doffer*.

When cylinder-cards were first used, hand-cards were employed to take off the cotton. Various contrivances were at different times adopted for improving this part of the process, until at length Arkwright contrived for the purpose a plate of metal toothed at the edge like a comb, which, instead of revolving as the former contrivances had done, was, by means of a crank, made to move rapidly in a perpendicular direction, and with slight but reiterated strokes on the teeth of the cards detached the cotton from them in a uniform fleece. This fleece is made to undergo compression on its passage to a roller, from which it is delivered in the form of a thick but soft thread, called a *card-end*, or *sliver*, into a tin can. The duration of the carding process is made to depend upon the quality of the cotton under preparation. If the fibres are short and coarse, the carding should be quickly performed, not indeed by accelerating the speed of the cylinders, but by taking the cotton faster off the cards.

The next operation is called *drawing*, and the machine by means of which it is performed is called the *drawing-frame*. The object of this drawing is to complete what has been begun by the carding-engine, viz., the arranging of the fibres of cotton longitudinally, in a uniform and parallel direction, and to remedy all existing inequalities in the thickness of the sliver. The drawing-frame acts upon the same principle as Arkwright's spinning-frame, two sets of rollers being employed moving with unequal velocities. In its passage through the first pair the sliver is simply compressed, but being drawn through the second pair with twice or thrice the original velocity, it is necessarily drawn out in the same proportion. In repeating this operation, which is called *doubling*, two, three, or a greater number of the drawings are passed through both sets of rollers; in the first they are made to coalesce, and in the second are again drawn out. This doubling and drawing process is repeated very frequently, in some cases as many as 1000 times, in order to correct every inequality in the thickness of the cord or sliver: up to this point the cotton has not been made to undergo any twist. This doubling and drawing process is of the utmost importance, and if ill or insufficiently performed, the yarn cannot prove of good quality.

Roving, the next step in the process, is a continuation of the drawing, with this only difference, that the cord, now called a *rove* or *slub*, being so much reduced in thickness that it will not otherwise hold together, a slight twist is given to it by passing it into a conical can, which, while

receiving it, is made to revolve with great velocity. The rove thus slightly twisted, is wound upon bobbins by children, and is then ready for the spinning frame. About the year 1817, a machine called a *fly frame* was contrived for preparing rovings for inferior numbers of yarn. Instead of revolving cans, this frame is provided with a series of spindles, each of which is provided with a flyer, the revolutions of which give the requisite twist to the cord, which is delivered at once to the bobbin fitted loosely on the spindle. The *tube frame*, more recently introduced, is used for preparing yarns of all qualities. Instead of cans, this frame is provided with revolving horizontal cylinders, and by its means a much greater quantity of work can be done in a given time than with the fly frame. The rove which it produces has no twist, and is therefore very tender, and the quantity of waste which it occasions is greater than is otherwise experienced. The tube frame is an American invention, but has been improved in this country; a patent for these improvements was granted in 1829.

The principle of Arkwright's spinning frame has been already explained. [ARKWRIGHT.] The yarn produced by its means received the name of water-twist, from the circumstance of the machinery being at first set in motion by water power. The throstle-frame is the same in principle as Arkwright's invention, but the movement of the parts is simplified, so that the speed of the machine is increased, and a greater number of spindles may be driven with an equal amount of power; it was introduced about the year 1810. The mule-jenny, invented by Samuel Crompton, combines the essential principle of Arkwright's frame with the property of stretching possessed by Hargreave's jenny. By means of the mule-jenny, the roving is first drawn and then stretched. The effect of this improvement is to make the yarn finer, and of a more uniform tenuity. When delivered by the rollers, the thread is thicker in some parts than in others, and these thicker parts not being so effectually twisted as the smaller parts, are softer and yield more readily to the stretching power of the mule, and by this means, the twist becomes more equal throughout the yarn. Throstle-spinning is seldom employed for higher numbers than forty to fifty hanks to the pound, because smaller yarn would not have strength to bear the drag of the bobbin, but in mule-spinning no bobbin is used, and the yarn is wound or built upon the spindles without subjecting it to any strain. The spindles in this machine are regularly arranged on a carriage, which when put in motion recedes from the rollers with a velocity somewhat greater than that at which the reduced rovings are delivered from them; during this time the yarn is receiving its twist by the rapid revolving of the spindles, and when the rollers are made to cease giving out the rovings, the mule-jenny still continues to recede, but with a slower motion, and its spindles to revolve, and thus the stretching is effected. The distance which the spindles recede from the rollers while both are in action is called a stretch; this is usually about fifty-four or fifty-six inches; the space through which the mule moves greater than and during the giving out of the rollers, is called the gaining of the carriage; and the further space accomplished by the carriage after the rollers are stopped, is called the second stretch; during this latter part of their progress, the spindles are made to revolve much more rapidly than before, which is to save time. When the drawing, stretching, and twisting of the thread are thus accomplished, the mule disengages itself from the parts of the machine by which it has been driven, and then the attendant spinner returns the carriage to the rollers, again to perform its task. While returning to the roller, the thread which has been spun is wound or built on the spindle in a conical form, and is called a cop. The mule-jenny is a complex piece of mechanism, and requires to have all its parts very nicely fitted and adjusted. At first it was constructed with only twenty spindles, but by successive improvements has been made sometimes to contain upwards of 1000.

The last great triumph of invention connected with cotton spinning which it is requisite to notice, is the self-acting mule contrived by Mr. Roberts, of the firm of Sharp, Roberts, and Co., machine-makers in Manchester. The carriage of this mule, after having drawn out and stretched and twisted, the thread is returned again to the rollers by mechanical means without the guidance or intervention of any intelligent agent, the only attendance required being that of children to join such threads as may have been ac-

cidentally broken in the stretching. This self-acting mule is even more complex in its arrangements than the original machine, and hence great doubts were entertained as to its successful working. It is probably owing to the great care and ability shown by the inventor in their construction that these doubts have proved ill-founded. This invention in its improved form was secured by patent in 1830, and has already come extensively into use; its advantages as regards economy, and rendering the manufacturer independent of a class of workmen who have frequently proved refractory, are so great, that this machine will, as a matter of course be adopted in every case where new machinery is required; it is already (1836) used in more than 100 factories.

If the yarn spun with the mule-jenny be intended for use as weft in the factory where it is produced, the cops are at once applied to the shuttle, and of late it is sometimes the custom to export them in that form; but when intended for warp, and generally when exported, the yarn is reeled into hanks each 840 yards in length, for performing which operation a self-acting reel has been contrived. This process is attended by young women. The diameter of the reel is $4\frac{1}{2}$ feet; when it has performed 80 revolutions, a lay is formed measuring 120 yards, and seven of these lays make up a hank. Each hank is separately tied round with a thread, and weighed to ascertain its fineness; the different sizes are then put by themselves and separately packed in paper bundles of either five or ten pounds weight.

Fine yarns are usually singed, in order to remove their loose downy fibres and to give them smoothness. This is accomplished by subjecting the thread to the action of a series of coal-gas flames, through which it is several times passed with great velocity.

Cotton thread is made by laying together two or more yarns of equal quality, and twisting them, for which purpose also machinery is employed. Previous to the doubling and twisting, the yarn is passed through a trough, containing a thin solution of starch; the twist is given in an opposite direction to that applied by the spinning machine, causing the thread to resemble in this respect organzine silk.

Scarcely any operation in a cotton mill is carried forward without the intervention of a machine, by which the work is done with greater precision, and also with greater celerity, and consequently greater economy. The packing of the hanks of yarn into bundles is the work of a *bundle press*, by means of which the hanks are pressed into a very small compass, the power of the machine enabling young females to exert quite sufficient strength for the purpose.

The degree in which the inventions that have here been noticed have reduced the expenses attending this branch of manufacture, is shown by the following statement, drawn up by Mr. Dugald Bannatyne, lately and for many years secretary to the Chamber of Commerce at Glasgow. Prices of cotton-yarn, 100 hanks to the lb., in the following years:—

	s.	d.		s.	d.
1786 . . .	38	0	per lb.	1799 . . .	10 11
1787 . . .	38	0	"	1800 . . .	9 5

1795* . . .	19	0	"	After many fluctuations, in	
1796 . . .	19	0	"	1829 . . .	3 2
1797 . . .	19	0	"	1832 . . .	2 11
1798† . . .	9	10	"		

The waste of material in spinning cotton is variously estimated. Mr. Kennedy calculated, in a paper contributed by him to the Manchester Literary and Philosophical Society, that the waste amounts to $1\frac{1}{2}$ oz. per lb., or nearly one-tenth of the original weight; and this estimate is thought to be very near the truth.

The following statement, taken from the report of the commissioners appointed to inquire concerning the labour of children in factories, was designed to show, from actual returns made by a great number of manufacturers, the manner and proportions in which the different classes of work-people are employed in cotton mills, and the aggregate amount of their monthly net earnings throughout the kingdom.

* Spun from Bourbon cotton.

† Spun from Sea Island cotton.

Employed in	Adults.		Children under 18 years of age.						Proportion whose age and sex are uncertain, from a deficiency in the returns.	Total number employed.	Aggregate amount of monthly net earnings.

The following statement exhibits the actual working of a cotton-mill in Manchester, in the year 1834. The yarn made was all of fine quality; viz.

No. 130 to 150	5,038 lbs.
" 155 to 160	16,478 "
" 165 to 170	19,488 "
" 175	21,679 "

Total quantity of yarn spun 62,683 "

Total weight of rovings	68,127 "
Waste (1.278 oz. per lb.)	5,444 "
Number of mule jennies	109
" of spindles	32,448
Weight of yarn per spindle	1 lb. 14 $\frac{1}{2}$ oz.
Number of spinners employed	56
" of piecers employed	156
Total amount of wages paid	£ 5,894
Spinner's average net weekly earnings	24s. 8 $\frac{1}{2}$ d.
Cost of wages on each pound of yarn	1s. 10 $\frac{1}{2}$ d.

The relative cost of yarns of different degrees of fineness, the description of cotton used for their production, and the countries which are our chief customers for each quality, are as follows:—

Quantity of yarn.	Price per lb.	Growth of cotton employed.	Countries to which exported.
Water twist, No. 12	d. d. 12 $\frac{1}{2}$ to 13	North America, or India	Italy.
" 20	13 $\frac{1}{2}$ " 14	ditto	Germany and India.
" 30	16 " 16 $\frac{1}{2}$	ditto	
Mule twist, No. 40	16 " 16 $\frac{1}{2}$	ditto	
" 50	18 $\frac{1}{2}$ " 19	ditto	
" 60	21 " 22	ditto	
" 70	s. d. 2 2 $\frac{1}{2}$	North America, or Egypt	
" 80	2 5	ditto	
" 90	2 10	ditto	
" 100	3 3	ditto	
" 120	4 1	ditto	
" 130	4 6	ditto	
" 140	5 1	North America.	
" 150	6 6	ditto	
" 160	7 4	ditto	
" 170	8 5	ditto	
" 180	9 8	ditto	
" 200	13 0	ditto	
" 250	27 0	ditto	

The prices here stated were those obtained in January, 1836. It will be seen that the price of the same count is greater for water twist than for mule twist. The hardness and closeness of texture of the former better fits it for warps for heavy goods, such as fustians and for sewing cotton, while the lower numbers of mule twist are best adapted for weft in coarse goods, and the higher numbers for both warp and weft of fine cloths, such as muslins.

The rate of wages paid to persons of various ages in the cotton mills at Manchester, has been stated on the authority of the Factory Commissioners as under:—

	Average weekly wages.			
	Males.		Females.	
From 9 to 10	s. d.	s. d.	s. d.	s. d.
" 10 to 12	2 9 $\frac{3}{4}$	2 11 $\frac{1}{2}$	3 8	3 9 $\frac{1}{2}$
" 12 to 14	5 0 $\frac{1}{2}$	4 10 $\frac{1}{2}$	6 5 $\frac{1}{2}$	6 4 $\frac{1}{2}$
" 14 to 16	8 2 $\frac{1}{2}$	8 0 $\frac{1}{2}$	10 4	8 11
" 16 to 18	22 5 $\frac{1}{2}$	9 6 $\frac{1}{2}$		

The Act of 1833, for regulating the labour of children

in factories, forbids the employment in a cotton factory of any child under thirteen years of age for more than nine hours during the day.

It is a curious fact, that a great part of the yarn used for making very fine muslins at Paisley and Glasgow is spun in Lancashire. The machinery in the Scottish mills is equally well constructed, and the material used is of the same quality in both places; but the spinners in Lancashire who apply themselves to the production of fine yarn are comparatively few and selected from a greater number than find employment in Scotland, where the small proportion who attain the requisite sleight-of-hand are not able to produce fine yarns in sufficient abundance for the supply of the Scottish looms.

A great and increasing proportion of English spun yarn is every year exported to foreign countries. The exports since 1820 have been as follows:—

1820	23,032,325 lbs.	1828	50,505,751 lbs.
1821	21,526,369 "	1829	61,441,251 "
1822	26,595,468 "	1830	64,645,342 "
1823	27,378,986 "	1831	63,821,440 "
1824	33,605,510 "	1832	75,667,150 "
1825	32,641,604 "	1833	70,626,161 "
1826	42,189,661 "	1834	76,478,468 "
1827	44,878,774 "	1835	83,214,198 "

The table inserted under the head cotton manufactures, showing the exports of cotton goods generally in 1835, particularises the countries to which English spun yarn was sent.

COTTON MANUFACTURE AND TRADE. The use of cotton as a material for the production of woven fabrics was known in India and China for many centuries before its introduction into Europe. The earliest mention of cotton by the Greek writers is by Herodotus (iii. 106) in his brief notice of the usages of the Indi: he calls it (iii. 47) by the significant name of tree-wool (*εἰριον ἀπὸ ξύλου*), apparently not being acquainted with the native name. In the reign of Amasis, B.C. 563—525, cotton was known in Egypt, but it must have been imported, as there is no reason for supposing it was then grown in Egypt. Cotton cloths were, according to Arrian, among the articles which the Romans received from India, and there is no doubt the manufacture had been carried on in many parts of Asia, long before any extant notice of that quarter of the world being visited by Europeans. The perfection to which the weaving of cotton had then been brought by the natives of many parts of India, notwithstanding their rude and imperfect implements, attests at once their patience and ingenuity. In China, this manufacture is supposed not to have existed at all before the beginning of the sixth century of the Christian æra. The cotton plant was indeed known in that country at a much earlier period, but continued till then to be cultivated only as a garden shrub, and was not indeed propagated on a large scale until the eleventh century; at the present time nearly all the inhabitants of that populous empire are clothed in cotton cloths of home manufacture.

Before the discovery of the passage to India by the Cape of Good Hope, cotton wool is said to have been spun and woven in some of the Italian states, the traders of which were the channels through which the cotton fabrics of India were distributed to the different countries of Europe. Becoming thus acquainted with these goods, and having near at hand the raw material of which they were formed, it was natural that they should apply to the production of similar goods the manufacturing skill they had long possessed.

Baines has shown ('History of the Cotton Manufacture,') that the cotton plant was extensively cultivated, and its produce manufactured, by the Mohammedan possessors of Spain in the tenth century. This branch of industry flourished long in that country. In the thirteenth century, the cotton manufacturers formed one of the incorporated companies of Barcelona, in which city two streets received names which point them out as the quarter in which the manufacturers resided. The cloths made were mostly of coarse texture, and a considerable quantity was used as sail-cloth. The name *fustians*, from the Spanish word *fuste* signifying 'substance,' was borrowed from the Spanish weavers, and is still used to denote a strong fabric made of cotton. The intercourse between the Mohammedan possessors of Spain and the Christian inhabitants of other European countries was so small, owing to religious prejudice, that the arts which long flourished among the former, did not extend themselves to the latter; the traffic of Andalusia was all carried on with Africa and the East.

From Italy the art made its way to the Netherlands, and about the end of the sixteenth or the beginning of the seventeenth century was brought thence to England by protestant refugees. Lewis Roberts, in 'The Treasure of Traffic,' published in 1641, makes the earliest mention extant of the manufacture in England. He says, 'The town of Manchester buys cotton wool from London that comes from Cyprus and Smyrna, and works the same into fustians, vermillians, and dimities.'

There is abundant evidence to show that in the beginning of the sixteenth century, and probably before that time, cotton was cultivated and converted into clothing in most of the countries occupying the southern shores of the Mediterranean. The European conquerors of Mexico in their first invasion of that country found in use native manufactures of cotton, both unmixed and mixed with the fine hair of rabbits and hares. Some of these fabrics were sent by Cortes to Spain as presents to the Emperor Charles V. Cotton was cultivated and manufactured at an equally early period by different nations on the coast of Guinea, and it is stated by Macpherson in his 'Annals of Commerce,' that cotton cloths were imported into London in 1590 from the Bight of Benin.

It would be difficult to trace the introduction and progress of the cotton manufacture in the different countries of Europe where it is now established. Its growth has in every case been subsequent in point of time, and much inferior as regards its extent, to its progress in this country. Some idea of the relative importance of the manufacture in some foreign European states may be derived from the statement given in our account of the cotton trade of the shipments to those countries of the raw material from the principal country of its production, and to information thus derived we must for the most part restrict our notice of this branch of the subject.

In the notice of ARKWRIGHT (vol. ii., page 344), will be found a sketch of the various inventions and improvements to which the first great extension of our cotton manufacture must be attributed. Previous to the introduction of these inventions this manufacture was of small importance, as is evident from the quantities of the raw material then brought into the country. Arkwright's first patent for the mode of spinning by rollers was taken out in 1769, and the following account of the importations of cotton at different periods preceding and speedily following that event will show how rapid was the progress occasioned by it, and by the other inventions for which it prepared the way.

1697	1,976,359 lbs.	
1701 to 1705	1,170,881	„ average
1710	715,008	„
1720	1,972,805	„
1730	1,545,472	„
1741	1,645,031	„
1751	2,976,610	„
1764	3,870,392	„
1771 to 1775	4,764,589	} average
1776 to 1780	6,766,613	
1790	31,447,605	„
1800	56,010,732	„

The system under which this manufacture was long carried on was very different from that which is now pursued. It was the custom for the weavers who were dispersed in cottages throughout the district to purchase the material

with which they worked, and having converted it into cloths to carry their wares to market and sell them on their own account to the dealers; but about 1760, the merchants of Manchester began to employ the weavers, furnishing them with yarn for warp, and with raw cotton, which was spun by the weaver's family for the weft, and paying a fixed price for the labour bestowed in weaving.

The application of machinery to the preparation and spinning of raw cotton for weft preceded by some years the inventions of Arkwright. In the year 1760, or soon after, a carding engine not very different from that now used was contrived by James Hargreaves, an illiterate weaver, residing near Church in Lancashire; and in 1767 the *spinning-jenny* was invented by the same person. This machine as at first formed contained eight spindles, which were made to revolve by means of bands from a horizontal wheel. Subsequent improvements increased the power of the spinning-jenny to eighty spindles, when the saving of labour which it thus occasioned produced considerable alarm among those persons who had employed the old mode of spinning, and a party of them broke into Hargreaves' house and destroyed his machine. The great advantage of the invention was so apparent, however, that it was soon again brought into use, and nearly superseded the employment of the old spinning-wheel, when a second rising took place of the persons whose labour was thus superseded by it. They went through the country destroying wherever they could find them both carding and spinning machines, by which means the manufacture was for a time driven away from Lancashire to Nottingham.

The cotton-yarn produced both by the common spinning-wheel and spinning-jenny could not be made sufficiently strong to be used as warp, for which purpose linen-yarn was employed. It was not until Arkwright's spinning frame was brought into successful operation that this disadvantage was overcome. [ARKWRIGHT.] Yarn spun with Hargreaves' jenny continued for some time to be used for weft. At first, the manufacturers of cloths composed of cotton only were subject to much annoyance from the determination of the revenue officers to charge them with double the duty paid upon calicoes woven with linen warp and printed for exportation; and also by prohibiting their use at home. With some difficulty an act of parliament was obtained for removing these obstacles to the development of the manufacture, which from that time was prosecuted with a great and continually accelerated rate of increase.

The earliest attempts at producing muslins were made about the year 1780, but without much success, although India-spun yarn was substituted as weft for that produced by the spinning-jenny: the greatest degree of fineness to which yarn spun with Arkwright's frame had then been brought, was eighty hanks to the pound, and even this degree was not attainable by means of the jenny. This disadvantage was overcome by the invention of Mr. Samuel Crompton, which came into general use about the year 1786, and which partaking of the nature of both Hargreaves' and Arkwright's machines, was aptly called the *mule-jenny*. By means of this piece of mechanism, yarns were produced of a much greater fineness than had before been attained. Mr. Crompton's invention was made several years before it could be openly used, because of its interference with the patented invention of Arkwright; but when this patent was annulled, the mule-jenny was brought rapidly and extensively into use, so that in 1787, 500,000 pieces of muslin were made at Bolton, Glasgow, and Paisley, with yarn of British production. The price paid at that time by the manufacturers for these fine yarns was 20 guineas per lb.; but such have been the improvements since made in the machine and the manner of working it, that yarn of the same fineness has of late been sold at from 14 to 16 shillings per lb. Mr. Crompton did not secure to himself the benefit of his invention by taking out a patent; he carried on a spinning and weaving business on a small scale at Bolton, and worked his mule-jenny with his own hands in an attic. In a brief memoir of Crompton, Mr. Kennedy has stated, that about 1802 he, in conjunction with Mr. Lee, set on foot a subscription which amounted to 500*l.*, and with this Crompton was enabled to increase his manufacturing establishment, and to set up several looms for fancy work in Bolton. In 1812 he made a survey of all the cotton manufacturing districts in the kingdom, and ascertained that the number of spindles then at work upon his

principle amounted to between four and five millions : since that time the number has been doubled. The kind friends already named assisted him in making an application to parliament for some reward, and the great merit of his invention having been established before a Committee of the House of Commons, he received a grant of 5000*l.*, which was paid to him in full without any deduction for fees or charges. This money was employed by Crompton in putting his sons into business, but they proved unsuccessful, and he was reduced to poverty, when Mr. Kennedy again interfered in his behalf, and raised a second subscription, with the produce of which a life annuity of 63*l.* was purchased. He lived only two years to enjoy this small provision. The first mule-jennies consisted of not more than thirty spindles each, but the number has been progressively increased, and they now frequently contain more than 600 spindles each. With one of these machines, a good workman can produce in a week consisting of sixty-nine working hours, thirty-two pounds of yarn of the fineness of 200 hanks to the pound, and as each hank measures 840 yards, the produce of his week's work if extended in a line would measure 3050 miles. This work, extraordinary as it may seem, does not afford a full conception of the degree of tenuity to which cotton is capable of being reduced, one pound of raw cotton having been converted into 350 hanks, forming a continuous thread 167 miles in length. It is said that a few mules have lately been put to work, carrying each 1100 spindles. The greatest recent improvement made in the construction of this machine has been effected by Messrs. Sharp, Roberts, and Co., machinists of Manchester. These machines, which are called self-acting mules, do not require the manual aid of a spinner, the only attendance necessary being that of children, called piecers, who join such threads as may be accidentally broken. Self-acting mules were contrived at different times by Mr. William Strutt of Derby, Mr. Kelly of Lanark, Mr. De Jongh of Warrington, and others ; but none of these were brought successfully into use, owing no doubt, in some measure, to the inferior skill of the machine makers as compared with the perfection which they have since attained.

The first successful attempt to weave by means of machinery was made in 1785 by Dr. Cartwright, who secured the invention by patent. In a commercial point of view Dr. Cartwright did not draw any advantage from his power-loom ; but in 1809 he obtained from parliament a grant of 10,000*l.* as a reward for his ingenuity. Mr. Monteith, of Pollokshaws, Glasgow, who fitted up 200 power-looms in 1801, was the first person who brought them to profitable use. A great obstacle to their success was presented by the necessity for the frequent stopping of the machine in order to dress the warp. This difficulty was removed in 1804 by the invention of a machine for dressing the whole of the warp before it is placed in the loom, which was made the subject of a patent by Mr. Radcliffe, the inventor. In the use of this machine the warp in its progress to the weaving beam is passed through a dressing of hot starch ; it is then compressed between rollers to free it from the

superfluous quantity of starch taken up, and is afterwards, in order to dry it, drawn over a succession of ten cylinders heated by passing steam through them ; during this last part of the operation the warp is 'lightly brushed as it moves along, and is fanned by rapidly revolving fanners.' The flour used for this dressing operation throughout the cotton factories of this kingdom, amounts in the year to at least 650,000 bushels. The number of power-looms used in cotton factories throughout the kingdom at the end of the year 1835 was stated by the inspectors of factories in a return laid before parliament to be 109,626, which were thus distributed.

Each of these looms, if of good construction and attended by a skilful weaver, is capable of producing 120 yards of cloth per week, or 6240 yards in the year, at which rate the annual productive power of the whole number of looms amounts to 684 millions of yards. It is not probable however that the productive power of these machines is in all cases carried to its utmost extent. Hitherto it has not been practicable to produce any but coarse or heavy goods by means of the power-loom ; fine calicoes, muslins, and fancy goods are woven by the hand. The number of hand-loom weavers cannot be ascertained with the same correctness as the number of power-looms, the latter being collected together in factories which are under the superintendence of official inspectors, while hand-loom weaving is altogether a domestic manufacture carried on in the cottages of the artisans. Computations of the number of these domestic looms have been made by different intelligent persons conversant with the trade, who have estimated them variously ; the lowest at 200,000 and the highest at 250,000.

The numbers given in the following table refer only to persons engaged in spinning and power-loom weaving, and exclude altogether both hand-loom weavers and persons employed in printing and dyeing, with hosiery, the bobbinet manufacture, and the production of various small wares made of cotton. [HOSIERY, LACE.] Mr. McCulloch estimates that, 'allowance being made for old and infirm persons, children, &c., dependant upon those actually employed in the various departments of the cotton manufacture, and in the construction, repairs, &c., of the machinery and buildings required to carry it on, the entire cotton manufacture must furnish, on the most moderate computation, subsistence for from 1,200,000 to 1,400,000 persons.'

The following statement of the Number of Cotton Factories in operation in the different parts of the United Kingdom, with the Number and Ages of the Persons employed therein, is abstracted from Returns made by the Inspectors of Factories in 1835.

The total value of the cotton goods annually manufactured in Great Britain was stated by Mr. Huskisson to amount, in 1824, to 33,500,000*l.* This estimate was probably exces-

sive at that time, but such has since been the extension of this branch of industry that it is now assuredly below the truth. Mr. McCulloch, in the second edition of his 'Com-

mercial Dictionary,' published in 1834, estimated the value of every description of cotton goods made in Great Britain in 1833 at 34,000,000*l*. Mr. Kennedy, who is considered a good authority on this subject, supposed the value in 1832, when the quantity of the raw material used was about 12 per cent. less than in 1833, was 24,760,000*l*. Mr. Baines, who has taken great pains to test the accuracy of his calculations in every possible way, has made the value amount, in 1833, to 31,338,693*l*. (*Hist. of Cotton Manufacture*, p. 412). If this calculation was correct for that year, the value in 1835 must, owing to the increased production, have somewhat exceeded 35,000,000*l*., and according to custom-house returns, including 11 months of 1836, the amount during the year 1836 cannot fall much below 40,000,000*l*. The estimate made by Mr. M'Culloch calculates that the quantity of the raw material used is 240,000,000*lbs*., and its value at 7*d*. per *lb*. £7,000,000

Wages of 800,000 weavers, spinners, bleachers, &c., at 22*l*. 10*s*. per ann. 18,000,000

Wages of 100,000 engineers, machine-makers, smiths, masons, joiners, &c., at 30*l*. a year each 3,000,000

Profits of the manufacturers, wages of superintendents, sums to purchase the materials of machinery, coals, &c. 6,000,000

£34,000,000

The quantity of raw material taken for use in 1835 was 333,043,464 *lbs*.; this, at the average price of 8*d*. per *lb*., which is certainly below the actual rate, amounted to 11,100,000*l*., and assuming that through improvements in the processes of manufacture the wages and other expenses were no more than the estimate of Mr. M'Culloch, the value of goods manufactured in 1835 exceeded 38,000,000*l*. In the eleven months of 1836, from 5th January to 5th December, the quantity of cotton taken by the spinners has been 348,343,066 *lbs*., and although some little check to commercial operations was felt during a few weeks preceding and following the latter date, which may prevent

the consumption for the whole year being proportional to that of the eleven months, it may be fairly assumed that the quantity manufactured throughout 1836 will amount to 370,000,000 *lbs*., which, at the average price of 9½*d*. per *lb*., to which raw cotton has advanced through the year, will amount to 15,031,250*l*. There is no reason for believing that any material improvement in the spinning or weaving processes has been introduced within the last year, and on the other hand it is known that the prices of many articles auxiliary to the manufacture have increased, and that a continual accession has been made to the number of hands employed, while the wages of a part at least have been increased. Assuming then that the various items taken into the estimate by Mr. M'Culloch, as amounting to 27,000,000*l*., would have been correct as applied to the quantity used in 1835, those items upon the increased quantity of 1836 will amount to 30,000,000*l*., and the whole value of the manufacture will be 45,000,000*l*.

The declared value of cotton manufactured goods exported in 1835 was 16,421,715*l*., and of yarn 5,706,589*l*. It has been said that no reliance is to be placed upon the value thus declared; but besides the fact that the merchants have no motive for disguising the truth in these declarations, their general accuracy has been tested and proved in various ways by Mr. Baines, and it may afford a further corroboration that the value declared in 1835 amounts in the average to only 6½*d*. per yard upon the quantity shipped. It has been held that the value of the cotton fabrics retained for use within the kingdom exceeds the value of the part exported by 30 to 40 per cent., but if we content ourselves with estimating the value of the home and the export demand to be equal, the whole value of the manufacture in 1835 exceeded the sum above mentioned of 38,000,000*l*.

The progress of this manufacture is shown by the following table, which contains a statement of the quantity of cotton used by the manufacturers and the value of cotton manufactures exported from 1801 to 1835.

The capital invested in this branch of industry has been estimated by Mr. Kennedy at 30,000,000*l.*, and by Mr. McCulloch at 34,000,000*l.*, which greater amount is very moderate in the opinion of Mr. Baines. Mr. McCulloch supposes that a capital of 4,000,000*l.* is engaged in the purchase of the raw material, in which case the same money must be employed nearly at the rate of four separate transactions during the year; capital employed in the payment of wages 10,000,000*l.*, which supposes that the wages have to be advanced 6 months before the goods are produced and sold. The remaining 20,000,000*l.* are supposed to consist of stocks of goods on hand and of capital fixed in spinning and weaving factories, power and hand-looms, workshops, warehouses, and machinery. This latter portion of the capital must have been greatly increased of late; but notwithstanding the great increase in the amount of the manufacture, it is probable that no great addition to the floating capital has been required, the briskness of the trade causing a quicker return, so that the same amount of capital suffices for the transaction of a larger amount of business.

COTTON, SIR ROBERT BRUCE, an eminent English antiquary, descended from an antient family, was the son of Thomas Cotton, Esq., and born at Denton, in Huntingdonshire, January 22, 1570. He was educated at Trinity College, Cambridge, where he took the degree of B. A. in 1585. His taste for antiquarian studies induced him to repair to London, where he became a member of a society of learned men attached to similar pursuits. He soon distinguished himself as a diligent collector of records, charters, and instruments of all kinds relating to the history of his country. The dissolution of monasteries, half a century before, had thrown so many manuscripts of every description into private hands, that Mr. Cotton enjoyed peculiar

advantages in forming his collection. In 1600 he accompanied Camden, the historian, to Carlisle, who acknowledges himself not a little obliged to him for the assistance he received from him in carrying on and completing his 'Britannia;' and the same year he wrote 'A Brief Abstract of the question of Precedency between England and Spain.' This was occasioned by Queen Elizabeth desiring the thoughts of the Society of Antiquaries already mentioned upon that point, and is still extant in the Cottonian library. (*Jul. C. ix. fol. 120.*) Upon the accession of King James I. he received the honour of knighthood, and during this reign was not only courted and esteemed by the great, but consulted as an oracle by the privy councillors and ministers of state upon very difficult points relating to the constitution. In 1608 he was appointed one of the commissioners to inquire into the state of the navy, which had been neglected after the death of Queen Elizabeth, and drew up a memorial of their proceedings to be presented to the king, a copy of which is also preserved in the Cottonian library. (*MS. Jul. F. iii.*) In 1609 he wrote 'A Discourse of the lawfulness of Combats to be performed in the presence of the King, or the Constable and Marshall of England,' which was printed in 1651 and in 1672. He drew up also, in the same year, 'An Answer to such Motives as were offered by certain military men to Prince Henry, to incite him to affect Arms more than Peace.' This was composed by order of that prince, and the original manuscript remains in the Cottonian library. (*Cleop. F. vi. fol. 1.*) New projects being contrived to fill the royal treasury, which had been prodigally squandered, none pleased the king, it is said, so much as the creating a new order of knights, called baronets; and Sir Robert Cotton, who had been the principal suggester of this scheme, was, in 1611, chosen to be one, being the thirty-sixth on the list. His principal resi-

dence was then at Great Connington, in Huntingdonshire, which he soon exchanged for Hailey St. George, in Cambridgeshire. He was afterwards employed by King James to vindicate the conduct of Mary Queen of Scots, from the supposed misrepresentations of Buchanan and Thuanus. What he drew up on this subject is thought to be interwoven in Camden's 'Annals of Queen Elizabeth,' or else printed at the end of Camden's 'Epistles.' In 1616 the king ordered him to examine whether the Papists, whose numbers then made the nation uneasy, ought by the laws of the land to be put to death, or to be imprisoned. This task he performed with great learning, and produced upon that occasion twenty-four arguments, which were published afterwards, in 1672, among 'Cottoni Posthuma.' It was probably then that he wrote a piece, still preserved in the Royal Library, entitled 'Considerations for the repressing of the Increase of Priests, Jesuits, and Recusants, without drawing of blood.' He was also employed by the House of Commons when the match between Prince Charles and the Infanta of Spain was in agitation, to show, by a short examination of the treaties between England and the House of Austria, the unfaithfulness and insincerity of the latter, and to prove that in all their transactions they aimed at nothing but universal monarchy. Sir Robert Cotton wrote various other works, many of them small pieces in the shape of dissertations, too numerous to be mentioned here; some of them are among his Posthuma, others are printed in Hearne's 'Discourses,' and a few more still remain in manuscript.

As early as 1615, Sir Robert Cotton's intimacy with Carr, earl of Somerset, laid him under suspicion with the court of having some knowledge of the circumstances of Sir Thomas Overbury's death. He was even committed to the custody of an alderman of London; nor, although nothing could be proved against him, was he released from this confinement till the end of five months, during which time he appears to have been interdicted the use of his library. The perfidy of Gondomar, the Spanish ambassador, about the same time, drew upon him another imputation, his name having been, without foundation, inserted in a list suffered to go abroad of persons who had secretly received gratuities from the Spanish ambassador for sinister purposes. From this however his honour was perfectly vindicated.

Being a member of the first parliament of King Charles I., Sir Robert Cotton joined in complaining of the grievances which the nation was said, in 1628, to groan under; but was always for mild remedies, and zealous for the honour and safety of the king. In the next year an occurrence took place, the consequences of which shortened his days. A tract was handed about in manuscript, entitled, 'A Project how a Prince may make himself an absolute Tyrant.' The inquiries that were immediately made for the author of so pernicious a performance led at length to the Cottonian library. Sir Robert, perfectly conscious of his innocence, made strict inquiry into the transaction, and soon found that a copy of this tract, written at Florence, in 1613, by Robert Dudley, duke of Northumberland, under the less exceptionable title of 'Propositions for his Majesty's service to bridle the Impertinency of Parliaments,' had, unknown to him, found its way into his library, and that, equally without his knowledge, his librarian or amanuensis, as was suspected, for a pecuniary consideration, had suffered one or more copies of it to be taken, under the former of these titles. Although Sir Robert Cotton completely vindicated his innocence of having written or disseminated this tract, so destructive to the liberties of the people, yet under the renewed pretence that his library was not of a nature to be exposed to public inspection, it was again put in sequestration, and himself once more excluded from all access to it. He died at his house in Westminster, May 6, 1631. A short time before his death he requested Sir Henry Spelman to signify to the Lord Privy Seal, and the rest of the lords of the council, that their so long detaining of his books from him, without rendering any reason for the same, had been the cause of his mortal malady. From this, as well as other circumstances, it appears that his library was never restored to his possession. He was buried on the south side of the church of Connington, where a suitable monument was erected to his memory.

By his will Sir Robert Cotton directed that his library should not be sold, but should pass entire to his heirs; and it was much augmented by his son, Sir Thomas Cotton, and his grandson, Sir John Cotton. In 1700 an act of

parliament passed for the better securing and preserving this library in the name and family of the Cottons, for the benefit of the public; the mansion house, in which the library was contained, to be preserved for the use of the descendants of Sir Robert Cotton, the founder, for ever, and the library to be made publicly accessible; and to be vested after Sir John Cotton's death in trustees. Sir John Cotton died in 1702. Another act of parliament was then framed, which passed in 1706, by which the purchase of the house was effected for the sum of 4500*l.*, and that and the library vested thenceforth in the queen, her heirs, and successors for ever: the management of the library being still settled in trustees. Whether it was for the purpose of erecting a new building for the reception of the library on the site of the said house—which indeed was directed by the last mentioned act—or for what other reason, does not at present appear; but we are informed in a subsequent report of a committee of the House of Commons, that the library was in the year 1712 removed to Essex House, in Essex-street, Strand, where it continued to the year 1730, when it was conveyed back to Westminster, and deposited in a house in Little Dean's Yard, purchased by the crown of the earl of Ashburnham. Here, shortly after, on the 23rd October, 1731, a fire broke out, in which 111 manuscripts (many of them of the greatest interest) were lost, burnt, or entirely defaced, and ninety-nine rendered imperfect. It had indeed nearly proved fatal to the whole library. What remained were removed, by permission of the dean and chapter, into a new building designed for the dormitory of Westminster school. In 1753, when the legislature was induced by the will of Sir Hans Sloane to found the British Museum, the Cottonian library was included in the act under which that institution was founded, and was transferred to the British Museum in 1757. The act directed that two trustees, to be nominated in succession by the representatives of the Cotton family, should be for ever added to those appointed by the same act for the general execution of its purposes.

Besides the library of manuscripts, the Cottonian collection contained a considerable number of valuable coins, chiefly Saxon and old English, and several antiquities Roman and English, all of which are now incorporated in the collection of the British Museum.

A catalogue of this library, in a thin folio volume, compiled by Dr. Thomas Smith, was printed at Oxford in 1696; and a more ample one, accompanied by a copious index, compiled by the late Joseph Planta, Esq., was published under the orders and at the expense of the Commissioners upon the Public Records, folio, 1802.

Sir Robert Cotton was liberal in communicating materials out of his collections in his life-time. Speed's 'History of England' is said to owe most of its value and ornaments to it; and Camden acknowledges that he received the coins in the Britannia from his collection. To Knolles, the author of the 'Turkish History,' he communicated authentic letters of the Knights of Rhodes, and the dispatches of Edward Barton, ambassador from queen Elizabeth to the Porte. Sir Walter Raleigh, Lord Bacon, Selden, and Lord Herbert, were all indebted to Sir Robert Cotton's library for materials. Lingard's and Sharon Turner's 'Histories of England,' and numerous other works, are proofs that its treasures continue at this day unexhausted.

COTTUS (Linnaeus), a genus of fishes of the section Acanthopterygii and family Loricati* (Jenyns). Technical characters:—head large, depressed, furnished more or less with spines or tubercles; teeth in front of the vomer and in both jaws, none on the palatines, two dorsal fins; ventral fin small; body without scales; branchiostegous rays six.

The *Bull-head* or *Miller's thumb* (*Cottus gobio*, Linn.) affords an example of this genus. This little fish, which is found in almost all the fresh-water streams throughout Europe, is from three to four inches in length, and of a brownish colour above, more or less mottled and spotted, and whitish beneath. The head is very large in proportion to the body, and without spines; the preoperculum has a single curved spine on the posterior part; the eyes are small, and directed upwards. The number of fin-rays are—anterior dorsal 6 to 9, posterior 17 or 18; pectoral 15; ventral 3; anal 13; caudal 11. The bull-head more particularly frequents those streams in which pebbles abound, and feeds upon aquatic insects, &c.

* W. adopt the term Loricati, which is synonymous with the family of the Acanthopterygii, termed by Cuvier "celle des Joints Cuirassés."

The remaining British species of this genus inhabit the salt water, and together with others of the same habits, are distinguished from the fresh-water species by having the head armed with numerous spines.

The *Sea-scorpion* or *Short-spined Cottus* (*Cottus scorpius*, Bloch.) is very common on our coasts, and is found very frequently under stones or sea-weeds, in the little pools left by the retiring tide. It is thus described by Mr. Yarrell. 'The head large, more elevated than that of the river bull-head; upper jaw rather the longer; teeth small and sharp; eyes large, situated about half-way between the point of the nose and the occiput; irides yellow, pupils blueish black; one pair of spines above the nostrils, with an elevated ridge between them; the inner edges of the orbits elevated with a hollow depression above, but no occipital spines; preoperculum with three spines, the upper one the longest; operculum with two spines, the upper one also the longest, the lower one pointing downwards; there is besides a scapular and a clavicular spine on each side; gill-openings large; the body tapers off rapidly, and is mottled over with dark purple brown, occasionally varied with a rich red brown; the belly white; the first dorsal fin slightly connected with the second by an extension of the membrane; lateral line smooth; the ventral fins attached posteriorly by a membrane to the belly.' Length rarely exceeding eight or nine inches.

This fish feeds upon small crustacea and the fry of other fishes.

The *Father-lasher* or *Long-spined Cottus* (*Cottus bubalis*, Euphrasen), is about the same size and resembles the last both in appearance and habits; the two species, however, are seldom found in the same immediate neighbourhood. This species is distinguished from the last by its more perfectly armed head, the spines of which are longer in proportion, the space between the eyes is less, the crest above the eyes is more elevated, and the ventral fins are destitute of the connecting membrane observed in the short-spined cottus. There are several other points of distinction which will be found in detail in Yarrell's 'History of British Fishes.' The *four-horned Cottus* (*Cottus quadricornis*, Linn.) another species also found off the British coast, though less abundantly than either of the foregoing maritime species, may be distinguished, as its name implies, by the four tubercles which are situated on the top of the head, two on the nape, and two near the eyes; the preoperculum is furnished with three spines, and the operculum with one; length from ten to twelve inches.

Aspidophorus (Lacépède) being considered by Cuvier as a subgenus of *Cottus*, it may be well to notice it under this head. This genus, or subgenus, is thus characterized:—head large and depressed, more or less armed with spines and tubercles; both jaws furnished with teeth, none on the vomer; body attenuated posteriorly, covered with angular plates; ventrals small; branchiostegous rays six.

Several species of this genus are known, one of which is found not uncommonly on our own coasts, and is known by the name of the *Armed Bull-head* (*Aspidophorus Europæus*, Cuvier). This little fish, generally about four or five inches in length, is frequently caught in the shrimping nets, and is called by the fishermen, in some districts, *the Hook-nose*. Its general covering is brown above and white beneath: there are however most commonly indications, more or less distinct, of several broad dark marks across the back; the nose is furnished with four recurved spines, the upper jaw extends beyond the lower; the infra orbitals have three blunt tubercles on their lower margin, and a sharp spine directed backwards; the preoperculum is also armed with a spine; the branchiostegous membrane and chin are each furnished with numerous fleshy filaments; the body is divided longitudinally by eight scaly ridges, those on the upper part being most produced.

The number of fin rays are: dorsal 5 to 7; pectoral 15; ventral 3; anal 7; caudal 11.

The habits of this fish appear in many respects to be the same as those of the *Cottus scorpius*, &c.

COTURNIX. [QUAIL.]

COTYLE'DON is the leaf of a seed; it is the part prepared by nature to enable the young plant, when it first springs into existence, and before it has been able to form organs of digestion and respiration, to perform both those functions. This usually takes place as follows: in its original state the cotyledon contains carbon in excess; as soon as vegetation commences, oxygen is absorbed, and carbonic

acid is formed, with which the cotyledon freely parts, thus reducing the proportion of its carbon to that which is most conducive to the subsequent health of the individual. Connected with this is the development of saccharine matter which enters into the circulation of the young plant, and imparts vigour to all its nascent powers. Sometimes the cotyledon performs those functions under-ground during the whole period of its activity; but in many cases its subterranean life extends only to a few days or hours, after which it is elevated above the soil, and takes on the ordinary property of the leaves, decomposing carbonic acid and parting with oxygen. The latter case is commonly that of cotyledons containing but a small proportion of fæcula; the former is usually that of cotyledons in which amylaceous matter is copiously present, as in the common pea, the acorn, &c.

The situation of the cotyledon is on one side of the axis, of which the plumule is the apex, and the radicle the base. In the largest number of known seeds there are two cotyledons on opposite sides, on the same plane; in a few there are several opposite to each other in a whorl; in a considerable number there is only one; and among the lower plants there appears universally to be an absence of the organ. These differences have given rise to the terms Dicotyledons, Polycotyledons, Monocotyledons, and Acotyledons.

The first two and the last of these forms will be readily understood; but the structure of a Monocotyledon is far more puzzling to the student, in consequence of the axis not being found on one side of the cotyledon, as would have been expected. A common monocotyledonous embryo is a nearly cylindrical body, obtuse at each end, as at *fig. 4*, and its axis of growth is in the interior of the cotyledon, so that it can only be found by cutting the organ open. The following diagram will explain this anomaly. Let the upper line represent four kinds of embryos seen from the side, and the lower line the plan upon which those embryos are constructed, the inner circle being always the axis of growth, and the crescent or crescents the cotyledons. No. 1 is a common dicotyledonous embryo, with its cotyledons equal; No. 2 is a rare kind of embryo of the same kind, with one of the cotyledons exceedingly small. If the smaller cotyledon were absolutely deficient, it may easily be conceived that such an embryo as that at *fig. 3* would be the result, the angles of the crescent being drawn together round the axis, just as the edges of leaves are drawn together when they roll up in the leaf-bud. If we now suppose that the angles are not only drawn together, but actually united as at *fig. 4*, the presence of the axis within the cotyledon will no longer appear inexplicable.

COUA. [CUCULIDÆ.]

COUCH GRASS (*Triticum repens*) is a common and most troublesome weed which infests arable land, especially that which is of a light and mellow nature. It is perennial, and propagated both by seed and by extension of the root, which is long and jointed; each joint produces a fresh shoot, which, in a favourable situation, soon becomes a new parent plant, creeping along under the surface of the ground, and spreading over a whole field with great rapidity. It appears above ground like a blade of grass, or young wheat, which, in its tender state, is readily eaten by sheep. A seed stem afterwards shoots up, bearing a spike, composed of a middle rachis and alternate floscules on each side. Each of these produces three or four seeds, protected by a long pointed chaff. Many of the seeds never come to perfection owing to the increase of the roots, but in stiff ground and permanent pastures the roots are prevented from spreading, and then the seeds ripen. The principal propagation of the plant is by the root. The destruction and extirpation of couch grass is one of the first things which an experienced farmer sets himself to on

taking occupation of land which has been neglected by the preceding tenant.

There is no law in this country which obliges a tenant to keep his lands free from weeds. There is something of the kind in Belgium with respect to thistles and weeds which propagate by seed. An agricultural code is necessary to protect the landlord, and to prevent the woeful waste of labour produced by carelessness and bad management; and until such a code is established, agriculture will never make rapid progress.

To extirpate couch grass a dry time must be chosen in summer; the land must be ploughed with a deep furrow to bring the roots to the surface: when the land is dry, it must be rolled to break the clods, and all the roots which lie near the surface must be gathered by the harrows or the couch rake. Sometimes the roots are matted into tufts, which can only be got up by means of a fork or prong. In this case no manual labour should be spared, especial care being taken not to break the roots, but to get them out whole, with all their offsets, if possible. After this, Finlayson's harrows, described in vol. ii., page 226, may be used on light lands; or an instrument of a similar nature, called, from the shape of the tines, a *cat's claw*, and in Scotland a *grubber*, which will bring up all the roots that are within nine or ten inches of the surface. When all the couch has been apparently eradicated, there will still remain a sufficient number of pieces and joints, broken off by the instruments and left in the ground, to produce a fresh crop of couch grass, especially if the land is frequently stirred, and showers intervene. Hence the vulgar notion that some lands breed couch, and that it is useless labour to be at much expense to eradicate it. Such lands should be laid down with artificial grasses and kept in grass for several years, being depastured with sheep and cattle in preference to mowing them for hay.

In this case the couch grass will spring up above ground and gradually disappear, and when the land is broken up again not a vestige of it will remain. After this it may be kept clean for many years by hoeing and weeding.

In very stiff soils, as in Kent, the couch grass is got rid of by ploughing very deep and burying it eight or nine inches under the surface. For this purpose the furrow slice must be large, and turned completely over, not merely set on end as is often the case. The old turn-wrist plough, drawn by four horses, does this most completely, and this is the principal reason why many practical farmers in that county prefer this ponderous and clumsy instrument to lighter and more scientific ploughs. In very heavy land couch grass is easily kept down if an opportunity be taken to plough it to the surface in dry weather. The stiff clods in which the roots are entangled contract in drying, and in contracting destroy the texture of the root; when they crumble after a shower the couch may be collected by hand and burnt or carried away. If the method of ploughing it in is preferred, it should be done by trench ploughing, by means of two ploughs following each other in the same furrow. The first may go six or seven inches deep, and the second four or five; thus the couch grass will be buried much deeper than with one ploughing, and four horses with two men will do the work well, which will not be much more expensive than the turn-wrist plough, with four horses, a man, and a boy. This can only be done to advantage in deep soils, such as occur in a few counties only.

When a quantity of the roots of couch grass has been collected, they are usually burnt in heaps on the ground: the ashes serve to enrich the land in some degree, but a much more profitable use may be made of them. When they are cleaned from the earth which adheres to them, they are found to be nutritious and farinaceous. Pigs eat them greedily; horses and cows will also eat them, especially when boiled or steamed; and weight for weight they contain not much less nutritious matter than potatoes; it is downright waste therefore to burn them. By maceration and washing, a good fecula is obtained, which, with hot water, forms a jelly-like arrow-root. The decoction of the root has been recommended as a cooling and demulcent beverage, and not without apparent reason; but if it be not thought worth while to wash and steam the couch for food, it is still more profitable to decompose it by means of lime than to burn it. For this purpose it should be gathered into a large heap and watered to induce fermentation. When it has heated, it

should be turned over and mixed with quick lime in a considerable proportion; after two or three turnings with the spade, with an interval of a few weeks, it will be found converted into rich mould, which may then be spread over the land, either as a top-dressing for clover and artificial grasses, or ploughed in with the seed, where this method is practised.

To keep the land free from couch grass occasional summer tillage is necessary, which may be given when turnips are sown, or after an early crop, such as tares cut green, *Trefolium incarnatum*, or winter barley, without losing a crop. In a well-managed farm couch grass should no more appear than docks or thistles. In Belgium a slovenly farmer is called a couch grass farmer.

Dogs eat the blade of couch grass from instinct to purge and vomit, and hence it has been named, in French, *chien-dent* or *dog's tooth*; but the shape of the young shoots from the root may also probably have led to that name, for they have a great resemblance to a canine tooth.

It has been doubted whether, in some situations, couch grass might not be cultivated to advantage for its roots: no experiments however have been made in cultivating this prolific plant, as far as we know; but it is not unworthy the attention of those who take a pleasure in increasing the resources of agriculture. In years of great scarcity the root of couch grass has been used, in northern countries, mixed with flour, in making bread. It contains nothing unwholesome, and has a considerable resemblance in taste to the potato. The water in which the root of couch grass has been boiled may be used in the manufacture of bread; it would probably add considerably to the weight of the loaf when baked, but may perhaps communicate an unpleasant taste to it.

COUCHING. [CATARACT.]

COUGH, a violent expulsion of air from the lungs, attended, when the act of coughing recurs in rapid succession, that is, when there is a fit of coughing, with correspondingly rapid inspirations. Cough is a violent and sonorous expiration, during the effort of which a much greater quantity of air is expelled from the lungs than is returned by the corresponding act of inspiration.

The mouth, nose, fauces, pharynx, larynx, trachea, and bronchi, are lined by a highly irritable and exquisitely sensible membrane. That portion of this membrane which lines the air passages, properly so called, namely the larynx, trachea, and bronchi, possesses the properties of irritability and sensibility in so great a degree, that it cannot endure without the most violent excitement the slightest contact of a foreign body. It is necessary to the due performance of the function of the lung, one of the most important of the organic circle, that the tubes which lead to it should always be perfectly unobstructed; should invariably present to the air a free and uninterrupted passage. Among the expedients adopted to secure this purpose, one of the most important consists in the disposal and action of the membrane which lines the internal surface of the air-tubes. This membrane abounds with blood-vessels and nerves, by the action of which a large quantity of water is constantly separated from the blood, by which the tubes are kept in a state of perfect suppleness and moisture. A layer of the thick, tenacious, and viscid substance, called mucus, also separated from the blood by this membrane, is spread over its entire surface, by which it is defended from the irritating properties of the air, with which it must always be in contact. Moreover, the heat generated by the process of secretion [SECRETION] warms the air in its passage to the lungs; and so great is the degree of heat communicated to the air during its progress, that before it reaches the lung it is brought to the same temperature as that of the blood. Accordingly when the lining membrane of the air passages is sound, when the temperature of the air ranges within a certain limit, and when the air is pure, holding in solution or suspension no foreign and noxious body, the external cold exciting air passes deep into the interior of the body, into the very centre of the chest, not only without occasioning irritation, but even without producing sufficient sensation to induce consciousness. But when either of these conditions is changed, the state natural to the respiratory process is disturbed; irritation is excited; warning is given that some danger threatens the system; and an effort is made to remove the offending cause. The warning is announced, and an effort is made to remove the danger, by the act of coughing.

When the lining membrane of the air-tubes is exposed to any irritating cause, suppose, for example, to intensely cold currents of air, the first effect of this irritation is to occasion a sudden rush of blood to its capillary vessels. These vessels, with which every point of the membrane is thickly crowded, become preternaturally distended with blood. By this distension the membrane becomes thick and swollen, and this thickening and tumefaction may go on to such an extent as materially to narrow the calibre of the tubes, and of course proportionally to obstruct the passage of the air to the lungs. Hence the simple dilatation of the arterial capillaries of the air-tubes with blood, and still more the like dilatation of the venous capillaries, a state which constitutes the disease termed congestion [CONGESTION], may produce a high degree of irritation. This irritation induces the act of coughing, and the cough relieves the congestion in the following mode.

It may be shown that with every act of expiration a current of blood, that blood which has been acted upon by the air and converted from venous into arterial, issues from the lung, and is carried out to the system; that inspiration is the action during which venous blood flows to the lung; and expiration the action during which arterial blood flows from the lung: consequently, in any state of the system, transient or permanent, in which the inspirations preponderate over the expirations, the blood of the system partakes of a venous character; and on the contrary, when the expirations preponderate over the inspirations, the blood becomes of an arterial character. Cough, it has been stated, is a forcible expiration, during the effort of which a greater quantity of air is expelled from the lung than is returned by the corresponding act of inspiration; but during the same action a proportionate quantity of arterial blood is sent out to the system. Now the stimulating properties of this blood (for arterial blood is the proper stimulus of the capillary arteries of the system) excite those capillaries which, from any cause, have been thrown into a state of congestion, to increased action; and by this increased action the load of blood with which they were distended is forced onwards, and the exonerated vessels are restored to their natural state. In this manner the mere act of coughing oftentimes relieves a congested state of many organs of the system, and of the air passages and lungs in particular.

But whatever cause induces a sufficient degree of irritation in the lining membrane of the air passages to distend its capillaries with blood, is apt to increase the activity of its secretion. In the natural and healthy state of the membrane, the action between its secreting and absorbing vessels is so balanced, that only a certain quantity of mucus is allowed to remain in contact with the membrane; no more than is just sufficient to defend it from the irritating agent to which it is exposed. But under the influence of any unusual irritating agent, more mucus is poured out upon the surface of the membrane in a given time than the absorbents can remove, in consequence of which the mucus accumulates, and in the exact proportion to such accumulation must necessarily be the obstruction to the free passage of the air to the lungs. Further, whatever increases the quantity has also a tendency to change the quality of the secretion, rendering the mucus thin and acrid, or thick and sticky, and thus converting it from a bland and defending fluid, into a highly irritating substance. In order to remove this irritating substance cough is excited; that is, a column of air is violently expelled from the lung, and directed through all the air-tubes, carrying away by the force of the current whatever it meets with in its course. The creation of this current is the necessary effect of the action of coughing, and the removal of some irritation or obstruction is its ultimate object. Disagreeable, then, as a cough always is, it is a salutary action, not only conducive to the safety of the system, but often indispensable to the preservation of life. Death is sometimes the actual and the immediate consequence of its absence, or of its want of violence.

Cough is not a cause, but an effect; not a disease, but a symptom of disease. Without doubt there are states of the system in which it re-acts upon the malady of which it is the consequence, and greatly increases its severity and danger: it constantly requires regulation and control; but even if it were in the power of any remedies completely and suddenly to stop it, the result of their application would often be fatal.

Considered in relation to its causes, and as a sign of in-

ternal disease, cough presents a subject of inquiry of great practical interest and importance. While it is readily excited by trifling and transient causes of irritation, it is the invariable attendant of some of the most frequent and fatal diseases to which the human body is subject. It is also sometimes among the very first symptoms produced by those diseases; hence the early discrimination of its true character may give invaluable information of the danger which threatens, and lead to the adoption of preventive means, at the only time when such measures can be of the least avail.

From what has been stated, it is plain that cough may be induced by disease, or by any irritating cause affecting either the air-passages or the lungs. It is most frequently induced by irritation of the mucus membrane of the air-passages, and more especially by congestion or inflammation of this membrane, in any degree, and in any part of its course. There are few diseases of the lungs of which it is not an attendant: such as inflammation of their investing membrane, the pleura; inflammation of the cellular tissue which enters into their structure; effusion into their substance, &c. But the most important malady with which it is related is the deposition and action of that tubercular substance which lays the foundation of consumption. [PHTHISIS.]

But though the most frequent and important diseases of which cough is an early and obvious sign, are maladies which have their seat in the air-passages or in the lungs, yet it is very frequently excited by diseases of distant organs, which have only a remote and indirect relation with the respiratory functions. Thus it is sometimes produced by diseases of the stomach, but far more often by diseases of the liver; by the suppression of the secretion of bile, or by the secretion of bile of bad quality; by the over-distension of the gall-bladder with bile; by the irritation of worms in any part of the alimentary canal; by a disordered state of the organic nerves supplying the viscera which assist the stomach in carrying on the great process of nutrition; and by nervous irritation produced in any part of the body, as in dentition and some affections of the spinal cord. It is also readily induced, and is sometimes of very long continuance, in the nervous temperament, affecting especially hysterical and other irritable persons; and by the repulsion of cutaneous eruptions and the suppression of discharges to which the system has been long accustomed. When it is the result of hepatic disorder, the indications of disease of the liver may be so slight as to escape notice, unless the malady be carefully sought for; yet the cough all the time may be extremely violent, often presenting a spasmodic character, and very obstinate. The observant practitioner will detect its connexion with the liver partly by that very spasmodic character, and still more by the accompanying sense of fullness about the epigastric region, the loaded tongue, the loss of appetite, the constipated bowels, and other signs of indigestion. A short, dry, irritating, and very obstinate cough is often remotely connected with a disordered state of the digestive organs, immediately indicated by a relaxation and enlargement of the uvula, the elongated uvula producing considerable irritation about the root of the tongue and the epiglottis. In other cases, when the uvula is not particularly affected, the same troublesome cough equally accompanies a disordered condition of the soft palate and of the fauces. Local stimulants and other remedies may be applied to these parts without end and without avail; but their unhealthy condition, and the cough which accompanies it, completely disappear the moment the stomach, the liver, and the bowels are restored to a sound state.

The treatment of cough must of course be modified in every different case according to the causes on which it depends. If it be induced by cold congesting the air-passages, the remedies of catarrh [CATARRH] constitute the appropriate means of cure; if by inflammation of the lining membrane of the air-tubes, the remedies and the principles of their administration have been already described under BRONCHITIS. If it depend on diseases of the lung, the precise nature of the malady should be carefully and anxiously investigated; and the removal of the cough attempted only by the removal or prevention of the threatening or the actually existing disease. In like manner, if cough be induced by nervous irritation, by undue excitement in a nervous temperament, or by a disordered state of the stomach, liver, or bowels, it is absurd to attempt the

removal of the cough in any other mode than by the cure of the disease of which it is the sign, and to the discrimination of which it should be the guide.

COUGUAR. [FELIS.]

COUL. [TESTUDINATA.]

COUIA. [COYPOU.]

COULOMB, CHARLES AUGUSTIN DE, was born at Augoulême in 1736, studied at Paris, and entered at an early age into the army. After serving with distinction for three years in the West Indies, he returned to Paris, where he became known by a treatise on the equilibrium of vaults (1776). In 1779 he was employed at Rochefort, where he wrote his 'Théorie des Machines Simples,' a treatise on the effects of friction and resistances, which gained the prize of the academy, and was subsequently printed separately in 1809. A project of navigable canals had been offered to the *Etats* of Bretagne, and Coulomb was appointed by the minister of marine to examine the ground. His report was unfavourable, which so displeased some influential persons that he was placed in confinement: the pretext was, that he had no order from the minister of war.

The *Etats* afterwards saw their error, and offered Coulomb a large recompense, but he would accept nothing but a seconds' watch, which afterward served him in all his experiments. In 1784 he was *intendant des eaux et fontaines*; in 1786 he obtained the reversion of the place of *conservateur des plans et reliefs*, and was sent to England as a commissioner to obtain information on the hospitals. At the revolution he lost his public employments, and devoted himself to his domestic affairs. He was one of the first members of the Institute, and an inspector-general of public instruction. He died August 3, 1806, having supported a high moral and social character through life.

There are many men into whose biographies we are obliged to insert more account of their labours than will be necessary in the case of Coulomb. All his researches are of such permanent character, that it would be repetition to describe them in a work which must treat separately of mechanics and electricity. We have no prominent acts of mind to record which individualize his discoveries, though they were marked by a union of patient industry and experimental sagacity of no common order, accompanied by a strong sense of the necessity of mathematical experiment, or numerical determination of mechanical phenomena. He was, we may say, the founder of the school of experimental physics in France, a country which, till his time, had been by no means pre-eminent in that branch of discovery. His researches on friction, and resistances in general, were the first in which the subject had been pursued manually by one with the knowledge of mathematics necessary to combine or separate the results according to the subject and the method. In electricity he was the first who invented the method of measuring the quantity of action, and from it he deduced the fact of electrical attractions and repulsions, following the Newtonian law. He ascertained the non-penetration of these agents into the interior of solid bodies, and on these two conclusions the mathematical theory of electricity is now based. He even deduced the second phenomenon from the first. He extended in a great degree to magnetism his conclusions on electricity. The instrument by which these brilliant results were obtained was of his own invention, the TORSION BALANCE, the principle of which is a needle hanging from a flexible thread, in which the force of torsion necessary to produce a given effect in producing oscillations of the needle being first ascertained, the instrument remains a determinate measurer of any small forces; or, if the absolute force of torsion be unknown, it may be made to give comparative determinations. This construction, in the hands of Cavendish [ATTRACTION], determined the mean density of the earth, and is now as much of primary use in delicate measurements of force, as the common balance in analytical chemistry. There is, perhaps, no one to whom either the determination of resistances in mechanics, or the theory of electricity, are so much indebted as to Coulomb. The account of his life is from the article in the 'Biog. Univ.' by M. Biot. See also ELECTRICITY, FRICTION, &c.

COUMAROUNA ODORATA, also called DIPTERIX ODORATA, is the plant which yields the sweet-scented Tonga bean of the perfumers. It is a native of French Guiana, where it forms a large forest tree, called by the natives Coumarou; the trunk is said to be 60 or 80 feet high, with a diameter of three feet and a half, and to bear

a large head of tortuous stout limbs and branches. The leaves are pinnated, of two or three pair of leaflets, without an odd one at the extremity. The flowers appear in axillary branches, and consist of a calyx with two spreading sepals, and five purple petals washed with violet, of which the three upper are the largest and most veiny. The stamens are eight, and monadelphous. The fruit is an oblong hard dry fibrous drupe, containing a single seed; the odour of its kernel is extremely agreeable. The natives string the seeds into necklaces; and the Creoles place them among their linen, both for the sake of their scent and to keep away insects.

The genus belongs to the tribe Cæsalpinia, of the natural order Fabaceæ, or Leguminosæ.

[Coumarouna odorata.]

1. A ripe drupe. 2. The same cut open. 3. A complete flower. 4. The calyx with a young drupe projecting from it.

COUNCILLORS. [BOROUGH OF ENGLAND AND WALES, p. 210.]

COUNSEL, an abbreviation of counsellor. In England a counsellor is a barrister [BARRISTER], or one who has kept twelve terms at one of the four inns of court, and obtained a certificate under the 9 Geo. IV. c. 49. The word has no plural number, and is used to denote either one or more counsel. The duty of counsel is to give advice in questions of law, and to manage causes for clients. They are styled common law, equity, or chamber counsel, according to the nature of the business they transact. They are supposed to plead gratuitously. [ADVOCATE.] In the words of Mr. Justice Bayley, 1 Chit. R. 351,—'they are to be paid beforehand, because they are not to be left to the chance whether they shall ultimately get their fees or not, and it is for the purpose of promoting the honour and integrity of the bar that it is expected all their fees should be paid when their briefs are delivered. That is the reason why they are not permitted to maintain an action for their fees.' Counsel may be retained generally, that is, to advocate any cause in which the retaining party may be engaged, or specially with reference to a pending cause; and generally speaking, it is not optional for counsel to refuse a retainer; there are certain rules however by which their practice is regulated.

Counsel in a cause have the privilege of enforcing anything which is contained in their instructions and is pertinent

to the matter in question, and are not bound to inquire whether it be true or false: they are also at liberty to make fair comments on the evidence adduced.

Formerly, in cases of felony, counsel for the prisoner were not allowed to address the jury on his behalf; they might however examine and cross-examine the witnesses, and argue points of law; but now by stat. 6 & 7 Wm. IV. c. 114, all persons tried for felony may make full answer and defence by counsel.

Counsel are punishable by stat. West. 1. 3 Ed. I., c. 28, for deceit or collusion, and are so far under the jurisdiction of the judges, that in the event of malpractice they may be prohibited from addressing the court; there are also certain rules established by each court for the regulation of its own practice, to which counsel are subject.

COUNT, through the French word *comte*, from the Latin *comes*, *comitis*, meaning companion. Considered in its original acceptation, this word might be translated by assessor, an officer who, during the Roman republic, was given as an assistant to the proconsuls or the proprætors sent out to govern the provinces. Cicero speaks of these *comites* in several passages of his works. Dion Cassius states that Augustus Cæsar called by that name all the officers of his imperial household. These *comites* pronounced judgment on all matters referred to them by the emperor, and their judgments had the same authority as the *Senatus Consulta*. The council of state instituted by Napoleon gives a very exact idea of the constitution of that court tribunal. Like the council of state, the latter was invested with judicial, legislative, and executive power. The emperors of the East followed the example of those of the West, with this difference only, that the *comites* created by Augustus and his successors were the counsellors of the emperor, and the title belonged to the office and not to the person; whilst at the court of Constantinople it was quite the contrary. The nomenclature of these counts fills a considerable place in the Glossary of Ducange. The monarchies of modern Europe have inherited the tributary spoils of the lower empire. By substituting the word *grand* for that of *count*, which was a title common to all the officers or ministers of the emperors of the East, it is easy to show the analogy of the titles of modern court dignities to the antient. Thus, the *comes sacrarum largitionum* has been called *grand almoner*; the *comes curiæ*, *grand master of ceremonies*; the *comes vestiarius*, *grand master of the wardrobe*; the *comes domesticorum*, *grand master of the royal household*; the *comes equorum regiorum*, *grand equerry*, &c. The *comes marcarum*, counts of the frontiers, which were formerly called *marches* (a denomination still in use in the papal states), took subsequently the title of *marquis*; an innovation which raised long and serious discussions among the learned in feudal right and court etiquette.

Under the first two races of the Frank kings, the counts were, as under the lower empire, officers of various degrees. The count of the palace was the first dignity in the state, after the *maire* of the palace. He presided in the court royal when the prince was absent, and possessed sovereign jurisdiction. He also exercised a great influence in the nomination of the king's delegates, who, under the title of counts, administered the provinces. A count had the government of a small district, often limited to a town and its dependencies. He was at the same time a judge, a civil administrator, and a military commander. In case of war, he led in person the contingent of his county to the army. The learned Dutillet, in his '*Recueil des Rois de France, de leur Couronne et Maison*,' &c., expatiates on the functions of antient counts. With the progress of time, the counts, as well as the other officers appointed to govern the provinces, the towns, and the frontiers, succeeded in rendering their places hereditary, and in making themselves sovereign masters of the districts of which they had only been created removable and revocable administrators. At first they contented themselves with securing the reversion to their sons, then to their collateral heirs, and finally they declared those places hereditary for ever, under Hugh Capet, the son of Robert, count of Paris, who himself only obtained the throne partly in consequence of that concession. It was feudalism that introduced inheritance instead of election as a permanent rule in political successions. The supreme chief of the antient Franks, *koning* (Lat. *rex*), was a magistrate, and as a magistrate he was elected, although always from the same family. The inferior chiefs,

heri-zoghe, *graven*, *rakhen-burghe** (Lat. *duces*, *comites*, *judices*), were also elected. But when the feudal system attained its perfection, when men were no longer ruled by men, but lands by lands, and men by lands or by the legitimate heir of the lands, then no kind of election remained. One demesne made a king, as another made a duke, a count, a viscount, &c.; and thus the son of a count became a count, the son of a duke became duke, and the son of a king became king. Finally, to form a just idea of the formidable power of the feudal counts, we must refer to the period of the erection of the towns of the northern provinces of France into commonalties or republics, when their heroic population had to sustain a most deadly struggle, from the eleventh century to the middle of the fourteenth, before they could shake off the iron yoke of the counts and the bishops†. The term 'count' is now become in France a mere title, conferring no political importance. In the papal states, as well as in those of Austria, it may be bought with sums of money not at all considerable; and in the other monarchical states of the continent, it is granted as a mark of imperial or royal favour.

The title of *earl*, or, as it was often rendered in Latin, *comes*, companion, is of very high antiquity in England, being well known to the Saxons under the name of *ealdorman*, that is to say, *elder-man*, and also *shireman*, because each of them had the government of a distinct *shire*, or, as it is now generally called, *county*. The sheriff, under his latinized name, is called vice-comes, or viscount, which term [VISCOUNT] is now one of the titles of rank in the British peerage. The term count seems not to have been used in England as a title of honour, though the wives of earls from a very early period have been addressed by the title of countess. The king, in mentioning an earl in any writ or commission, usually styles him 'trusty and well-beloved cousin,' a peculiarity at least as antient as the reign of Edward III.

COUNTER-APPROACH, a trench leading from the covered way of a besieged fortress, at some point on either flank of the ground upon which the works of the besiegers are formed, and extending to any convenient distance towards the country: it is frequently terminated by a small redoubt or battery, from whence a fire of light artillery is directed into the trenches of the enemy. These trenches being always, if possible, disposed so that they cannot be enfiladed by the guns of the fortress, a counter-approach becomes necessary in order that the garrison may be enabled to silence the fire from them, or to impede the communications along them.

If counter-approaches are intended for more than a momentary purpose, the parapets of the redoubts should be strong enough to resist the fire of artillery, and those works should be secured against an attack at their gorges by lines of palisades.

COUNTER-FORTS, in military architecture, are buttresses of brick or stone built against the revetment walls by which the outward pressure of the rampart, or of the natural ground on the opposite side of the ditch, is resisted. The rectangular portions at N and M fig. 2, BASTION, are counter-forts so situated. They are intended to increase the strength of such walls, and are formed between them and the earth which the walls retain. Their depth is usually equal to the mean thickness of the revetment, and they are placed at intervals of about 18 feet from each other, along the walls. They are sometimes connected together by counter-arches. [REKETMENT].

COUNTER-GUARDS are outworks occasionally constructed on the exterior of the bastions or ravelins of a fortress in order to retard the formation of a breach in either of those works.

The counter-guard is in general merely a line of rampart surmounted by a parapet, and broken in direction so as to form two faces parallel to those of the work which it covers: it has less relief than the interior work, in order that the fire from the latter may have some superiority over that of the enemy in any lodgment which he may form in the counter-guard when he has taken it. Its breadth, in rear of the parapet, should not exceed about 18 feet, that,

* *Heri-zoghe*, in its proper acceptation, means *leader of an army*, from the word *heer*, army, and the verb *ziehen*, to lead. *Grave*, *graf*, *gheref*, means, in all the Germanic dialects, the authority of a secondary magistrate. *Rakhen-burghe* means notable persons; they were employed as judges and guardians of public order.

† Chron. apud Script. Rer. Francic. tom. xii. p. 539, 541, 950, and tom. xiii., p. 476 and 534.

while there may be room for the defenders, the enemy may not have sufficient space for the establishment of a battery on its *terreplein*; and consequently, that he may not be able to breach the bastion or ravelin till, by mining or otherwise, he has destroyed the counter-guard.

When counter-guards are constructed in front both of a bastion and of the collateral ravelin, the interval between their extremities unavoidably leaves a face of one of these works exposed; and, as a breach in the former would be more fatal to the defenders than one in the latter work, the lengths of the counter-guards must be determined by the condition that the exposed face be that of the ravelin.

What are called counter-guards in the second and third systems of Vauban are, properly, bastions detached from the line of rampart called the *enceinte*. [See the work marked V, in *fig. 3. BASTION.*]

COUNTERMINE. [MINES, MILITARY.]

COUNTERPOINT, in music (*contrapunctum*), is a term now synonymous with harmony [HARMONY], and nearly so with composition; but the latter implies more of invention, of imagination, particularly as relates to melody, than counterpoint imports. Counterpoint in its literal and strict sense signifies *point against point*. In the infancy of harmony, musical notes or signs were simple points, or dots, and in compositions in two or more parts were placed on staves, over, or against, each other. Subsequently the term was applied to the parts added to a given melody, such melody taking the name of *cantus-firmus*, *canto-fermo*, or plain-song. [PLAIN-SONG.] Viewing it in this sense, the Padre Martini wrote his very elaborate and justly-celebrated *Saggio di Contrappunto sopra il Canto-Fermo* (1774), a work to which we refer every student who wishes to enter deeply into the subject. But Zarlino, in his *Istitutione Harmoniche* (1589), ranks counterpoint as the principal part ('*soggetto principale*') in airs, &c., written in two parts. And many writers consider the word as applying generally to composition in parts, among whom are the learned Dr. Pepusch, the acute Spanish jesuit Eximeno,

the industrious Dr. Lichtenthal, &c.; so unstable is musical language, so ill defined musical terms!

Counterpoint is divided into Simple, Florid or Figurate, and Double. *Simple Counterpoint* is a composition in two or more parts, the notes of each part being equal in value to those of the corresponding part, or parts, and concords. Johann Fux*, in his *Gradus ad Parnassum* (1725), furnishes us with the following examples of this species, calling one part *cantus firmus*, or the *canto fermo*, the other *contrapunctum*, or counterpoint, and taking each in turn as the melody. We have here substituted the treble for the c clefs.

Counterpoint.

Canto fermo.

Canto fermo.

Counterpoint.

In *Florid Counterpoint* two or more notes are written against each note of the subject, or *canto fermo*, and discords are admissible. Examples from Fux.

Double Counterpoint, says the German theorist whose

Counterpoint.

Canto fermo.

Canto fermo.

Counterpoint.

examples we have quoted, 'is a species of composition in which any of the parts may be transposed into the tenth above or below, omitting some notes, the subject remaining stationary.' Or, in other words, it is an inversion of the parts, so that the base may become the subject, the subject the base, &c., thus producing new melodies and new harmonies, 'in an artificial and wonderful manner,' adds Pedro Cerone, who seems to have been quite delighted with the contrivance; at a period, however, (1613) when subtleties of all kinds were more valued than in the present day. Fux

gives the subjoined examples of double counterpoint, from which it will be seen that this is little more than an extension of florid counterpoint. In the first example the *canto fermo* is the base, the counterpoint the treble. In the second the *canto fermo* is the upper part, while the counterpoint is transposed a tenth lower, and becomes the base. In the third the *canto fermo* and counterpoint remain as in the first example, while the latter, transposed a tenth lower, is adopted as a base, as in Ex. 2; and thus is formed a composition in three parts.

Ex. 1.

* Johann Joseph Fux was Kapellmeister to the Emperor Charles VI.

Ex. 2.

Ex. 3.

The study of Counterpoint is necessary as part of the education of a good musician, though now much neglected; it has, nevertheless, been sometimes carried to such a length as to become pure pedantry. For the principal rules of Counterpoint,—and also for some brief remarks on the question, ‘whether the art of writing in parts,’ was understood by the antients—see **HARMONY**.

COUNTERSCARP, is that side of the ditch, about a fortress, which is opposite to the ramparts. The part which is in front of the salient angle of a work is in the form (on the plan) of a circular arc having the vertex of that angle as a centre; and, if the ditch be that of an outwork, the direction of the counterscarp is generally parallel to the rampart; the counterscarp of the main ditch is in the direction of a line which is a tangent drawn to the arc from the shoulder of the collateral bastion. [See the lines above FG, GE, *fig. 1. BASTION*.] This is intended, since the length of the flank is greater than the breadth of the ditch at the said angle, to allow the whole fire of the flank to be directed along the main ditch; and Cormontaigne suggests that the tangent should be drawn from the interior side of the parapet at the shoulder angle, in order that the fire of the man stationed there may more accurately graze the wall of the counterscarp.

A deep ditch, having the earth retained on the side of the country by a nearly vertical wall, is generally considered indispensable for a fortress, because the descent of the enemy into the ditch is thereby rendered difficult: the defence of the covered way is also thereby prolonged, since the enemy who may have entered it at one place is unable to advance on account of the traverses which are constructed across it. Carnot, however, recommends that the counterscarp side of the ditch should be formed in a gentle slope rising from the bottom to the level of the natural ground, in order that the garrison may with facility make those great sorties which he considers as one of the most powerful means of defence.

COUNTERVALLATION, a chain of redoubts executed about a fortress in order to prevent the sorties of the garrison: the works are generally unconnected with each other, but sometimes they are united by a continuous line of parapet. It has happened, during the continuance of a siege or blockade, that the investing corps has been menaced by an army coming up to relieve the fortress; in which case, when it is intended to act on the defensive without abandoning the siege, a chain of redoubts is constructed to strengthen that corps on the exterior: this is called a circumvallation; and originally, like the interior chain, it entirely surrounded the fortress.

According to Thucydides, the town of Platæa, when besieged by the Lacedæmonians, was surrounded by a line of palisades to prevent the egress of the garrison; and subsequently a circumvallation was added. At the siege of Alesia, the countervallation executed by Cæsar con-

sisted of a rampart of earth, 12 feet high, which was surmounted by a parapet, probably of stakes, and by turrets, at the distance of 80 feet from each other. A triple ditch was formed between this line and the town. The Roman army was encamped beyond the line, and enclosed by a circumvallation of similar form; the latter was 14 miles in circumference. It is related in the continuation of the history written by William of Tyre, that, at the siege of Acre by Richard I. of England, the defenders made a sortie, and having forced the agger, began to plunder the camp; and it is added, that Saladin, being in the neighbourhood with an army, made a night attack on the lines: these circumstances sufficiently indicate that both countervallations and circumvallations were then in use.

The long duration of antient sieges rendered such works indispensable; but the use of artillery having greatly abridged the time to which the defence of a fortified place can be extended, they have become of less importance, and, in fact, it is only when the garrison is strong and the quarters of the besieging army are separated by the obstacles of the ground, that any works are considered necessary; and, in this case, instead of continuous lines of palisades and high towers of wood, a few simple redoubts and breast-works of earth are constructed at intervals. In general the besiegers are protected by an army of observation in the field when any effort on the part of the enemy to raise the siege is apprehended.

COUNTY. [**SHIRE**.]

COURAN'TE, or **CORANTO**, a quick dance in triple time. In Handel's, Mattheson's, and other lessons for the harpsichord, composed towards the end of the seventeenth and beginning of the eighteenth centuries, a *Courante* is generally introduced as one of the movements.

COURCELLES. [**HAINAULT**.]

COURIER, from the French *courir*, to run; a messenger sent in haste, or express; a bearer of despatches. The advantage of receiving the earliest intelligence, and of conveying orders with celerity, must have given rise to the employment of couriers at a very early period. Herodotus (viii. 98) gives a particular description of the speed of the Persian royal messengers who proceeded by relays. He says this mode of conveying intelligence was called by the Persians *ἀγγαρήιον* (Angareïon); and the couriers themselves *ἀγγαροί* (angaroi). Another description of couriers among the Greeks were called *ἡμεροδρόμοι*, who appear to have been armed with a light spear or dart, &c. (Suidas in voce.) Herodotus (vi. 105) says that a little before the battle of Marathon, Pheidippides (an *ἡμεροδρόμος*, a runner by profession) being sent by the Athenian generals, arrived at Sparta on the second day after leaving Athens, a distance not less than 140 or 150 miles. (See also Suidas, v. *ἱππίας*.) The mode of employing couriers by Cyrus, as described by Xenophon (*Cyri Instit.* viii. 6), appears to be nothing more than the system already referred to as described by Herodotus. He

ascertained the journey which a horse could fairly perform within a day, and placed stables at regular distances, so that messengers could receive or deliver letters from hand to hand.—Gibbon, in his 'Decline and Fall of the Roman Empire,' (chap. ii.) speaks of the swiftness and regularity of the Roman posts. The Romans called such messengers *cursores*: they were sometimes sent on foot and sometimes on horseback. The earliest couriers of the European nations were probably what have since been called running-footmen. In manuscripts of the thirteenth century such messengers are occasionally styled *trottarii* or trotters. The running-footmen or couriers, who accompanied John Duke of Marlborough in his wars, are several times represented in the tapestries at Blenheim-house.

COURIER, PAUL LOUIS, was born in 1774. His father was a substantial farmer, who gave him a good education. Courier made considerable progress both in classical and mathematical studies. He served in the French army in the campaign of Rome in 1798-9. In his letters written from that country to several friends, and especially in one dated Rome, January 8, 1799, published long after in his *Correspondance Inédite*, he gives a frightful account of the spoliations, plunder, and cruelties committed by the invaders in that unfortunate country. Courier's love of the arts and literature, which never forsook him during his military career, made him especially indignant at the rapacity with which precious sculptures, paintings, and MSS. were torn from public and private collections, and hastily and often ignorantly or carelessly huddled together and packed up for Paris, by which several valuable objects were injured or lost. He also describes the misery of the people of Rome, many of whom were absolutely starving, while the generals, commissioners, and other agents of the French Directory were revelling in luxury. On his return to France after the first peace, Courier published several translations from the Greek, such as Isocrates' Eulogy of Helena, Xenophon's treatise on the Command of Cavalry and on Equitation, and remarks upon Schweighæuser's edition of Athenæus. He also began a translation of Herodotus.

In 1806 he again served in Italy with the army that invaded the kingdom of Naples. He went into Calabria as far as Reggio, and witnessed the desultory but cruel warfare carried on in those regions. His letters from Naples, Calabria, and Puglia, 1806-7, give some valuable information concerning those times and events. Here again Courier spoke to his friends the language of truth; he was not more blinded by the proclamations of Napoleon the Emperor than he had been by those of the republican Directory. His testimony confirms what Colletta and other national writers have recorded of the atrocities of the Calabrian war. He comments severely on the judicial murder of Rodio, a colonel in the service of king Ferdinand, who was taken prisoner, tried by court-martial, acquitted, then tried again, Courier says by orders from Napoleon, condemned, and executed. He speaks also in the same letter, Naples, July 1807, of a courier from the queen being murdered near Naples, and his despatches sent to Paris, and other transactions of a similar nature.

Courier served with the rank of chef d'escadron in the Austrian campaign of 1809. After the battle of Wagram, he gave in his resignation, which was readily accepted; for his inquisitive turn of mind and independent temper made him looked upon as a troublesome person by the more thoroughgoing officers of Napoleon. On reaching Florence, he discovered in the Laurentian library an unedited MS. of Longus, of which he meant to avail himself for a translation of that author. Happening to upset an inkstand on the MS. by which accident a page was blotted, the librarian accused him of having done it purposely. Courier defended himself, but some persons in power at the Court of the Princess Eliza, Napoleon's sister, took part against him, and he was ordered out of Tuscany. Courier wrote a humorous account of the whole transaction, in a letter addressed to Mr. Raynouard, in which he did not spare his accusers. His translation of Longus was subsequently published in 1813 and was well received by the learned. Retiring to his farm at Veretz, in the department of Indre et Loire, he heard with no regret the fall of Napoleon, and expressed himself as satisfied with the charter given by Louis XVIII. if conscientiously fulfilled. He however began soon to find fresh matter for his satirical vein. His 'Livret,' or Memorandum-book, and his letters, give a curious picture of provincial politics, and of the state of society in the interior

of France after the restoration. He exposes the petty absolutism and consequential tone of the local authorities, the prefects, sub-prefects, procureurs du roi, clerks, and all the departmental, district, and communal bureaucracy. One of his letters turns upon the style in which a procureur du roi writes to order the arrest of a man, the style, as Courier observes, of the imperial regime. His letters, several of which were published at the time in the 'Censeur,' have been compared for their power and humour to Pascal's celebrated Provinciales. He also directs his attacks against the priests, many of whom, by their intolerance, fanaticism, and meddling spirit, did infinite mischief to the cause of the Bourbons. When, in 1821, a subscription was opened all over France to purchase the estate of Chambord for the infant duke of Bordeaux, he wrote 'Simple Discours aux Membres de la Commune de Veretz,' for which he was tried, and condemned to one month's imprisonment. He published an account of his trial, under the title of 'Procès de Paul Louis Courier, vigneron.' Courier was now looked upon as one of the most formidable antagonists of the Bourbonist party. He was however by temper a grumbler, caustic and satirical rather than factious. At the beginning of 1825 he was found murdered near his house at Veretz, but no clue was discovered to the perpetrators of the crime. Some attributed it to political, others, perhaps with more reason, to private enmity. His works have been collected, and published in four volumes 8vo., Brussels, 1828. The fourth volume contains his unedited letters. They are valuable as sketches of actual life and manners, and as materials for contemporary history.

COURLAND, one of the Baltic provinces of Russia in Europe, is composed of the former duchies of Courland and Semigallia, of the old bishoprick of Piltan, and of Polangen, a district of Samogitia. It was until 1795 a possession of the Polish crown. The boundaries of Courland are, on the north, the gulf of Riga and Livonia; on the west, the Baltic sea; on the south, the province of Wilna, and Prussia; and on the east, the provinces of Vitepsk and Minsk. Its area, according to the inquiries of the Courland Society of Arts and Literature, is 9575 square miles, but according to Reymaim and Hassel, 10,689; and the population, which was 418,162 in 1790, may now be estimated, according to Arsenief, at about 450,000. The surface towards the sea coast is level, and presents a sandy plain about Mitau, Windau, and Goldingen, but its general character is undulating. It is intersected by two ranges of heights, one of which runs parallel with the Düna or Dwina, while the other takes a more westerly direction, and spreads its arms out in various directions. The most elevated points are the Huningberg, an agglomeration of sand, which is about 450 feet high, and the Silberberg. The coast is partly flat, and partly lined with sand-hills. The most northerly point is the dangerous promontory of Domes-Nüs, which is a continuation of the Blue Mountains, and stretches out between the Baltic and the gulf of Riga. Two-fifths of the soil are covered with forests or underwood, and a considerable part by moors of peat: nearly 15,000 acres are covered with marshes, or occupied by the 300 lakes and ponds and 118 small streams and rivulets which render the climate of Courland, though not unhealthy on the whole, raw, moist, and foggy. The largest of these lakes is the Usmaiten, in the western district of Goldingen, which is about twenty miles (thirty-five versts) in circumference; that of Sausken is ten miles long, and nearly two and a half broad; that of Angern is more properly a bay or 'haff' of the gulf of Riga. The principal river is the Düna, which skirts the eastern boundary of Courland, and of which the Aa or Bulleraa, one branch of which flows into it by a north-westerly course from the Livonian frontier, is a tributary. Besides these two rivers, Courland is watered by the Windau (which, entering it from the province of Wilna, takes a northerly course, forms a fine cataract near Goldingen, and falls into the Baltic at Windau), the Libau, the 'sacred' Aa, Anger, Bartau, &c. There is a canal of some importance near Goldingen; but that which, when completed, will be of far more essential benefit to the province, is the canal begun in 1825, which will unite the Windau and the Niemen. There are sulphurous springs at Smoden, Baber, and Baldanen.

The soil of Courland is in general light and sandy; it is most productive on the side towards Livonia. In the moors and morasses blocks of granite are occasionally found imbedded. Agriculture is the principal occupation

of the inhabitants, who raise large quantities of rye, barley, and oats, but less in proportion of wheat, and less still of peas and beans. The crops of grain are more than adequate to the consumption, which is about 1,300,000 tshetverts (which is about 940,000 quarters). Flax and hemp are extensively cultivated, and of excellent quality; the seed of the first, which is sown in June, yields a crop in eight weeks. A little tobacco is raised, and some fruit is produced; but the ordinary sorts of vegetables are grown everywhere. Courland has not sufficient pasture land to make the rearing of cattle a common occupation. Horses and horned cattle are of an inferior kind, and the sheep yield but an indifferent quality of wool. The value of the fisheries along the coast does not exceed 1200*l.* or 1300*l.* sterling per annum. The supply of game is abundant. The extensive forests are in general situated on marshy ground, and consist principally of pines, firs, beeches, oaks, and elms, of low growth. Of minerals, Courland contains small quantities of bog-iron, lime, and gypsum. It has also coals and marble, but they have not hitherto been turned to much account. Amber is thrown up on the coast.

The population is of the same extraction as the Lithuanians, from whom the native Courlanders differ in no other respects than that they are more advanced in civilization, and use a slightly varied dialect. Independently of these native Courlanders (332,195 in the year 1828), there are several thousands of Livonians, Lithuanians, Jews, Germans, Krewincks (a race of Finnish descent), Russians, and Poles, scattered throughout the province. The inhabitants are mostly Lutherans; for out of the whole number returned in 1826, which was 384,789, there were not more than 23,627 who were not Lutherans. In 1825, the excess of births over deaths amounted to 7755. The Jewish community are about 10,000 in number.

The land belongs principally to the Courland nobility, who are either Germans or Poles; they are possessed of peculiar rights, such as their own civil jurisdiction, exemption from taxation, and not being liable to military service. These rights, where not in direct opposition to the Russian laws, were confirmed to them when the partition of 1795 transferred their country to Russia. Their numbers were 1126 in the year 1828. The towns are mostly inhabited by individuals of German extraction; they are free, and quite independent of the nobility. The peasant is by the law a serf in the strictest sense, and in vassalage either to the nobility or burgesses; he has no property which he can call his own, may be bought or sold, and is subject to the arbitrary chastisement of his owner. Of late however emancipation has been granted by many proprietors, and the lot of this unfortunate class has been greatly ameliorated. In fact, it is not probable that the Courland nobility will long hold out against the example set them by the landholders of Livonia and Esthonia.

The wants of each estate are mostly supplied by the serfs themselves, part of whom are brought up to mechanical arts; the peasant makes his own clothing, furniture, and domestic utensils, and constructs his own humble dwelling: he buys no manufactures. In 1831 the Courland manufactories were only one pottery, and one establishment for making copper wares; some lime-kilns and tile-houses, and three paper-mills, which employed but fifteen workmen. The only exception is the vast number of brandy distilleries.

Courland is under the general direction of the governor-general of the Baltic provinces, and the administrative duties devolve upon a civil governor, resident at Mitau; both are subordinate to the executive at St. Petersburg. The ecclesiastical affairs of the province, as respects the Protestants, are conducted by the consistory of Mitau, who have 141 churches in their jurisdiction; the Roman Catholics and Greeks together possess but 19 churches, the first being subordinate to the bishop of Samogitia, and the Greeks to the bishop of Pskof.

Courland is in general administered according to its own laws and usages; but in regard to fiscal and military affairs, it has been placed on the same footing as the other provinces of the empire. Dorpat is the university for this province; the only high school is the gymnasium at Mitau: the other establishments for education consisted, in 1832, of fifty-nine schools, conducted by 144 teachers, and attended by 1643 pupils, of whom 246 were females: thirty of those schools were maintained at the expense of private persons. The nobility continue to assemble at diets, and have a permanent committee at Mitau. The province is divided into

head-captaincies, and each of these into two captaincies, besides the district of Pilten. Courland Proper, or the northern parts, contain the captaincies of Tuckum, of which Tuckum (about 1300 inhabitants) is the capital; and Goldingen, of which Goldingen, with about 2400, is the capital. Semigallia, or the southern parts, is divided into the captaincies of Mitau, of which Mitau on the Aa, the provincial seat of government, with about 13,000 inhabitants, is the capital; and Seelburg, of which Jakobstadt on the Düna, with about 1800 inhabitants, is the capital. The district or bishopric of Pilten lies in the south-west, and has Pilten for its capital, with about 400 inhabitants. This district is also known by the name of Hasenpoth, which is derived from that of the largest town in it, now become the capital: it has about 1100 inhabitants.

Courland has two shipping ports, Libau (about 5000 inhabitants) and Windau (1200), both situated on its western coast. The exports of native produce consist of grain, hemp, flax, linseed, skins, salted meat, &c., and average about 130,000*l.* a year; the imports scarcely exceed 50,000*l.* per annum. The inland trade is monopolised by the Jews.

COUROUCOU. [TROGON.]

COURSE OF EXCHANGE. [EXCHANGE.]

COURT-MARTIAL, a tribunal occasionally instituted for the purpose of trying military and naval men for the commission of offences affecting discipline in either of those branches of the public service.

Courts for the trial of rebels by martial law appear to have early existed in this country; and in the time of Henry VIII., the Marshal of England held one regularly for the trial of causes connected with military discipline. In the reigns of Elizabeth and her successor, those courts of war, as they were called, were superintended not by the marshal, but by a president chosen for the purpose. This president was probably a general or field-officer, but captains of companies were allowed to sit as members. The colonel of each regiment was charged with the duty of preparing the evidence relating to offences which fell under his cognizance, and of bringing it before the court. But courts-martial in their present form were instituted in the reign of James II.; and in the ordinances of war published in 1686 they are distinguished as general or regimental. Subsequently to the revolution, their powers have been expressly regulated by parliament, and are fully detailed in what is called the Mutiny Act, which is revised and renewed every year. Naval courts-martial are regulated by the statute 22 Geo. II., c. 33.

General courts-martial are assembled under the authority of the king, or of an officer having the chief command within any part of his Majesty's dominions to whom such authority may be delegated. Regimental courts-martial are held by the appointment of the commanding officer of the regiment. The East India Company's Mutiny Act empowers the governor-general in council, and the governor in council, at the presidencies of Fort William, Fort St. George and Bombay, and at St. Helena, to appoint general courts-martial, or to authorize any military man not below the rank of a field-officer to do so. What are called detachment courts-martial, may be either general or regimental, and their appellation is derived from the nature of the command with which the officer convening the court is invested.

The chief crimes of which a general court-martial takes cognizance are mutiny, abandonment of a fortress, post, or guard committed to the charge of an officer or soldier, disobedience of orders, and desertion: these crimes, if proved to their greatest extent, are punishable with death; and the penalty extends to any military man, being present, who does not use his best endeavours to prevent them. In desertion is included the fact of enlisting in any regiment without having had a regular discharge from that in which the offender may have last served. The practice of sending challenges between commissioned officers, is punished with cashiering; between non-commissioned officers and privates, with corporal punishment: and, in all cases, seconds and accessories are held to be equally guilty with the principals. Self-mutilation, theft, making false returns of stores, and neglect of ordinary duty, in non-commissioned officers and privates, are usually punished by the infliction of a certain number of lashes, not exceeding one thousand; and men of the former class may, in addition to other punishments, be suspended, or degraded to the ranks. There are many offences which might tend to the subversion of discipline, but which are hardly capable of being precisely defined, as

immoralities, and behaving in a manner unbecoming an officer and a gentleman; of these the courts-martial take cognizance, and on conviction the offender may be dismissed from the service. At home, military men are not, in general, amenable to courts-martial for civil offences; but abroad, where there may be no civil courts, the case is different.

The provisions of the Mutiny Act affect not only the cavalry and infantry of the regular army, but extend to the officers and privates in the corps of artillery, engineers, and marines; to all troops in the employment of the East India Company, or serving in the colonies; to the militia during the time that it is assembled and being trained; and lastly, to the yeomanry and volunteer corps. All are subject, without distinction, to trial and punishment by courts-martial.

The rules of the service require that the president of every general court-martial should be a field-officer, if one of that rank can be obtained; but, in no case, must he be inferior in rank to a captain. And it should be observed, that none of the members are to be subalterns when a field-officer is to be tried. As the president has the power of reviewing the proceedings, it is prescribed, and the propriety of the regulation is manifest, that he be not the commander-in-chief or governor of the garrison where the offender is tried. A judge-advocate is appointed to conduct the prosecution in the name of the sovereign, and act as the recorder of the court.

No general courts-martial held in Great Britain or Ireland are to consist of less than thirteen or nine commissioned officers, as the case may require; but in Africa and in New South Wales the number may be not less than five; and, in all other places beyond sea, not less than seven. Commonly, however, a greater number are appointed, in order to guard against accidents arising from any of the members being found disqualified or falling sick. An uneven number is purposely appointed, in order that there may be always a casting vote; and the concurrence of two-thirds of the members composing the court is requisite in every capital sentence. No officer serving in the militia can sit in any court-martial upon the trial of an officer or soldier in the regular army; and no officer in the regulars is allowed to sit in a court-martial on the trial of an officer or private serving in the militia. Likewise, when marines, or persons in the employment of the East India Company, are tried, the court must be composed of members consisting in part of officers taken from the particular service to which the offender belongs. The members both of general and regimental courts-martial take rank according to the dates of their commissions; and there is a particular regulation for those who hold commissions by brevet. [BREVET.] They are always sworn to do their duty, and witnesses are examined upon oath.

In the accusation the crime or offence must be clearly expressed, and the acts of guilt directly charged against the accused; the time and place must be set forth with all possible accuracy; and, at a general court-martial, a copy of the charge must be furnished by the judge-advocate to the accused, that he may have full opportunity of preparing his defence. The accused has the power of challenging any of the members, but the reason of the challenge must be given, and this must be well founded, otherwise it would not be admitted; for the ends of justice might be often defeated from the impossibility of getting members to replace those who were challenged.

The court must discuss every charge brought against the accused, throwing out only such as are irrelevant; and judgment must be given either upon each article separately, or the decision of the court upon all may be included in one verdict. The evidence is taken down in writing, so that every member of the court may have the power occasionally of comparing the proceedings with his own private notes; and he is thus enabled to become completely master of the whole evidence before he is required to give his opinion. At the last stage of the trial the decisions of the several members are taken in succession, beginning with the junior officer on the court: a regulation adopted obviously in order to insure the unbiassed opinions of those who might otherwise be influenced by deference to the members who are superior to them in age or rank.

Regimental or garrison courts-martial are appointed by the commanding officer, for the purpose of inquiring into criminal matters of the inferior degrees; and they are empowered to inflict corporal punishments to a certain extent only. The articles of war require that not less than five

officers should constitute a court of this nature, or three when five cannot be obtained. The practice is to appoint a captain as president, and four or two subalterns as the case may be; the court has no judge-advocate to direct it; therefore the members must act on their own responsibility. The proceedings are to be taken down in writing, and the sentence cannot be put in execution till it has been confirmed by the commanding officer, or by the governor of the garrison.

No commissioned officer is amenable to a regimental court-martial; but if an inferior officer or private should think himself wronged by such, he may, on application to the commanding officer of the regiment, have his cause brought before a regimental court-martial, at which, if the complaint is judged to be well founded, he may on that authority require a general court-martial to be held.

An appeal may be made from the sentence of a court-martial by the party who conceives that he has suffered injustice; the appeal lies from a regimental to a general court-martial; and from this to the supreme courts of law in the kingdom. It is easy to imagine, however, that the superior court will refuse to receive the appeal unless there should be very satisfactory evidence that the merits of the case have not been fairly discussed.

After the sentence of the court-martial has been pronounced, it is transmitted to the king, who may either confirm it, or, if sufficient reason should exist, may, on the ground that the process is not complete till the royal sanction has been given to the judgment, return it to the court for revision; or again, by virtue of his prerogative, he may remit the punishment awarded.

The chief distinction between the trial by court-martial and by jury is, that in the latter the verdict must be unanimous, while in the former the concurrence of a majority only in opinion determines the verdict. The writers on military law have endeavoured to show that the advantages in this respect are on the side of the court-martial: they contend that every member of such court delivers the opinion which he has formed from the evidence before him; while it may frequently happen in other courts that, in order to procure unanimity, some of the jury must surrender their own opinions. It may be observed, however, that in such a case the decisions are at least of equal value, since, in the event of a concession of private judgment, the verdict is in fact formed on the opinion of the majority.

(Grose, *Military Antiquities*; Tytler, *Essay on Military Law*; Samuel, *Historical Account of the British Army*; Simmons, *On the Practice of Courts-Martial*, with Supplement.)

COURT OF RECORD. [COURTS.]

COURTESY OF ENGLAND is the title of a husband to enjoy for life, after his wife's decease, hereditaments of the wife held by her for an estate of inheritance, of which there was seizin during the wife's life, and to which issue of the marriage is born which by possibility may inherit. It is said to be called courtesy of England as being law peculiar to this country. In the law of Scotland however it is known under the title of 'jus curialitatis,' and it is also stated in a Rescript of Constantine, Cod. vi., 59, 1, and in the laws of the Alemanni, Lindenbrog, 'Codex Legum Antiquarum,' 1613, p. 387, 'Lex Aleman.' c. 92; though by the law of the Alemanni the husband took the inheritance under circumstances similar to those that establish the title to a life estate only in the English law. This title of the husband's tenancy of the estates of his wife depends upon a valid marriage, the seizin of the wife during marriage of the same estate respecting which courtesy is claimed, issue born alive during the wife's life capable of inheriting, and the death of the wife. Lands held by the wife descendible only to her sons would not, in case of the birth of a daughter, be subject to this title of the husband; nor would a child brought into the world by the cæsarean operation, after the mother's death, establish it. It differs from the similar rights of the wife to dower in several respects, the wife taking only part of the husband's estate, and being entitled to her tenancy though no issue is born; whereas the husband takes the whole estate, the caput baroniæ, and such indivisible rights out of which dower is not or cannot be assigned. By the custom of Gavelkind, a man may be tenant by the courtesy without having had issue by his wife.

COURTESY OF SCOTLAND, otherwise called in the law of that kingdom 'jus curialitatis,' or right of courtship,

is substantially the same with the courtesy of England. As in the latter kingdom, five things are necessary to it; namely, marriage, that the wife is an heiress and infest, issue, and the death of the wife.

As to the marriage, it must indeed be a lawful marriage, but it is not necessary that it be regular and canonical; it is sufficient that it is valid in law, whatever be the precise form in which it became so. According to the ancient borough laws, c. 44, the courtesy extended only to such lands as the woman brought in tocher; but afterwards it was the lands to which she had right by inheritance, as the law still is. It was always the law that the wife must be heritably infest and seised in the lands. The fourth requisite is, inheritable issue born alive of the marriage; that is to say, the child born must be the heir of the mother's estate, and it must have been heard to cry; for though it be otherwise in England, crying is here the only legal evidence of life. In the last place, by such issue the husband has during the life of the wife only *jus mariti*, as Skene says (*De verb. signif. voce Curialitas*); after her decease he has *jus curialitatis*; or as Blackstone speaks, with reference to the law of England, the husband by the birth of the child becomes tenant by the courtesy *initiate*, but his estate is not *consummated* till the wife's death; which is the fifth and last requisite to give the complete right of courtesy, the husband needing no seisin or other solemnity to perfect his title.

COURTRAY or **COURTRAI**—in Flemish Kortryk,—a fortified town of West Flanders, the chief place of the district of the same name, is about 16 miles east from Ypres and 25 miles south from Bruges, in 50° 49' N. lat. and 3° 18' E. long. The town occupies both banks of the river Lys, by means of which it has communication with the principal towns of Flanders. Courtray existed in the time of the Romans, under the name of Cortoriacum, and as early as the seventh century enjoyed the privileges of a municipal city. The fortifications were begun in 1290; the castle was built in 1385 by Philip the Bold, duke of Burgundy. The works were enlarged and perfected, chiefly by the French, who built a citadel in 1647. The Flemings, in 1302, commanded by John count of Namur, encountered a French army near to Courtray, and found on the field, after the battle, about 4000 gilt spurs, which caused it to be called the battle of spurs. The town was taken by the French successively in 1643, 1646, 1667, and 1683, and was restored to Spain by the peace of Ryswick. The French destroyed the fortifications in 1744; in 1793 they obtained a victory over the English near the town, of which they took possession a few days afterwards, and constituted it chief place of the department of the Lys.

The population of the town, on the 1st January, 1835, was 18,858, and that of the entire parish 19,124; its streets are wide, the houses well built, and it contains several fine buildings, among others the Town-hall, a Gothic structure, the churches of St. Martin and of Notre Dame. This last-mentioned was built by Baldwin count of Flanders. Courtray contains an exchange, a college, and two asylums for orphans. A great part of the working population is employed in spinning flax, and in weaving and bleaching linen cloths and table-linen. The fine linens, known under the name of Courtray cloth, are made in the surrounding districts, and sold unbleached in the weekly market held in the town, where the pieces are finished and prepared for sale to the consumers. The number of pieces of linen thus brought to the town annually amount to 30,000; about two-thirds of this quantity are bought by the dealers in Courtray, and the remainder are sold to brokers from Bruges, Ypres, Ghent, and Brussels, and even to English and French merchants. The dyers of Courtray imitate with success the colour known as Turkey-red. Thread-lace and silk-lace are among the branches of industry pursued.

(Van der Maelen's *Dictionnaire Géographique de la Province de la Flandre Occidentale*; *Statistical Papers printed by order of the Belgian government*.)

COURTS. The Courts of Common Law in this country, like most other branches of our constitution, have grown up gradually with the progress of the nation, and may be traced back, partly to the institutions of our Anglo-Saxon forefathers, and partly to the more artificial systems introduced under the government of the Normans. From the earliest times of which we have any account, we find the tribunals of the Germanic nations consisting of a presiding officer, called Graf Reeve or Earl, Comes or Count; to-

gether with certain assessors, whose denominations (and probably their functions also) were different among different tribes and at different periods. Of this nature were the earliest tribunals with which we are acquainted in this country. The most important of these, was that whose jurisdiction extended over a shire or county, in which the presiding officer was at first the Earl, Alderman, or Count; and subsequently, his deputy the Vice Count or Sheriff (Shire Reeve). This tribunal exercised ecclesiastical as well as civil jurisdiction, and the bishop sat as an associate to the earl or sheriff.

The judicial functions of this Court were divided into four distinct branches. The first included all ecclesiastical offenses; and in these the bishop was judge, and the count or sheriff his assistant, and if the delinquent disregarded the censures of the church, he enforced the sentence by imprisonment. The second branch (in which the sheriff was judge) included all temporal offences, such as felony, assaults, nuisances and the like. The third head included all actions of a purely civil nature: here the sheriff was the presiding officer, and executed the judgment; but the judges were the freeholders who did suit to the court. And fourthly, the sheriff's court held an inquest yearly of frank pledge. One branch of the jurisdiction of this tribunal was abolished by William the Conqueror, who separated the ecclesiastical from the civil power, and the bishop was no longer associated with the civil magistrate. The view of frank pledge now exists only as a form, but the other two branches of jurisdiction still subsist, though with diminished power and importance.

In order to exercise his criminal jurisdiction, the sheriff was required twice in every year to make a tour or circuit of his county. The power of determining felonies was taken away by Magna Charta, but the remains of this tribunal are still known as the sheriff's tourn, in which cognizance is taken of false weights, nuisance and other misdemeanors. The civil jurisdiction of the sheriff still continues in the county court, the powers of which were limited to cases under forty shillings, at least as early as the reign of King Edward I.: and that sum now (except in case of replevin) limits the ordinary jurisdiction of the county court.

The land over which the jurisdiction of the sheriff extended, is said to have been distinguished as *reve land*. The thanes or nobles had, in the lands granted to them, a similar jurisdiction of their own, as well civil as criminal. (1, Reeve's *Hist. of English Law*, 7.) The limits between the jurisdiction of the sheriff and that of the lord were strictly preserved. But when the lord had no court, or refused to do justice, or when the parties were not both subject to his jurisdiction, the suit was referred to the tribunal of the Reeve; and a suit commenced before the lord might be removed by the defendant before the higher tribunal.

The civil tribunal of the lord was similar to the county court in its constitution and its powers, except that the presiding officer was not a public functionary (as the Reeve was), but the bailiff of the lord. This tribunal still exists under the style of the court baron, and is incident to every manor in the kingdom. The judges are the freeholders who owe suit and service to the lord of the manor, and if there are not at least two such freeholders in the manor, the court is lost. This was formerly the proper court in which to commence real actions to try the title to lands within the manor. The lord's tribunal in criminal cases, in which he had the same powers that the sheriff exercised in his turn, was called the *Leet*.

The same powers which were exercised over a particular manor by the court baron and court leet, were also exercised over particular hundreds by the hundred court and the leet of the hundred. But the number of these courts was much diminished by stat. 14 Edward III., by which all hundreds, except such as were of estate in fee, were re-joined (as to the bailiwick of the same) to the counties at large.

Besides these courts of inferior jurisdiction, there was also a supreme tribunal, in which the king presided. In the Saxon age, and for some time after, the legislative, the administrative, and the judicial functions of the government had not been separated; and the Wittena-geinote, or meeting of the wise, was consulted by the monarch in all these departments indiscriminately. The Anglo-Saxon king had the same jurisdiction over his thanes that they had over their own vassals. He punished all enormous

crimes committed against the king's peace. His court was likewise open to all those to whom justice had been refused in the inferior tribunals; and he had the power of punishing the judges if they pronounced an iniquitous sentence. It also seems probable that the king's court was a court of appeal, in which the judgments of all other tribunals, if erroneous, might be reversed.

The Norman Conquest does not seem to have produced any immediate change in the constitution of this national assembly, which thenceforth became more known as the Great Council. Its members exercised the same varied functions as under the Saxons; but when they sat in their judicial capacity, they had the assistance of the great officers of state and certain persons learned in the law, styled Justiciars, or Justices. William the Conqueror also created an officer to preside over judicial business, under the title of Chief Justiciar. The functions of this tribunal thus became gradually separated from the general business of the grand council; and from being held in the hall of the king's palace, it was distinguished by the style of *Aula Regis*. A great distinction was drawn between this and all the courts of Saxon origin, from the mode of authenticating its proceedings. There were at this time no written memorials of legal proceedings, and indeed of few other public acts; and when it was necessary to establish any judgment or statute which had been made by the king assisted by his council, it was usual to call the testimony of some of the nobles who were present, to bear *record* of the fact. In progress of time, all such proceedings were written down at the time on parchment, the nobles present signing their names as witnesses, and so bearing record of the truth of what was there alleged. The writing itself was called a record; and it was held to be evidence so conclusive, that when produced, nothing was allowed to be alleged in derogation of it. The entry of proceedings on record was adopted in the judicial, as well as in the other departments of the great council, and hence the *Aula Regis* became distinguished as *a court of record*. The power and importance of the *Aula Regis* rapidly increased. It not only maintained the former powers of the council in punishing offences against the public, in controlling the proceedings of inferior courts, and in deciding on questions relating to the revenue of the king, but it engrossed also a great portion of the 'common pleas,' or causes between party and party. And though we may suppose that it was only the more important causes that were taken into the *Aula Regis*, yet as early as the reign of Edward I., when the jurisdiction of the county courts was confined to 40s., all actions above that amount were brought into the king's courts.

The *Aula Regis* seems at a very early period to have been distinguished as exercising three several capacities, according to the different natures of the causes that were brought before it, which are treated of in our earlier legal writers as pleas of the king, common pleas, and pleas of the exchequer. The bond of connexion between these several jurisdictions was the chief justiciar, who presided over all of them. But in the reign of Edward III., this office was abolished, and thus were finally destroyed the unity of the *Aula Regis* and its connexion with the grand council, which became henceforth essentially a legislative body; and though it still retains traces of its original functions in its title of the *High Court* of Parliament, yet it has ever since ceased to exercise any judicial powers, except in cases of impeachment, or as a court of ultimate appeal. On the dissolution of the *Aula Regis*, the three courts of the King's Bench, the Common Pleas, and the Exchequer, had each of them a perfectly distinct and separate existence. The Court of King's Bench had the control of all inferior tribunals and the cognizance of all trespasses against the king's peace; the Court of Exchequer had cognizance of all cases relating to the revenue; and the Court of Common Pleas was the only tribunal for causes of a purely civil nature between private persons. The Courts of King's Bench and Exchequer still retain each of them its peculiar jurisdiction; and the Common Pleas is still the only court in Westminster in which a real action can be tried; but the great mass of causes between party and party may now be brought indiscriminately in any of the three courts. The mode in which the King's Bench and the Exchequer originally contrived by fictitious proceedings to appropriate to themselves a share in the peculiar jurisdiction of the Common Pleas will be found in the accounts given of those courts.

There was likewise another court, of a more limited character, which though held in the *Aula Regis* does not appear ever to have been under the control of the chief justiciar, viz., the Court of the Marshalsea, which had jurisdiction where one of the parties at least was of the king's household. Charles I. created by letters patent a new court, styled the Court of the Palace, with jurisdiction over all personal actions arising within the verge of the palace, that is, within twelve miles of Whitehall. These courts are now held together every Friday. The Court of Marshalsea is, in fact, disused, but the Palace Court is in active operation.

The Saxon kings had been in the habit of making progresses through their dominions for the purpose of administering justice. This practice was not continued by William the Conqueror; but he annually summoned his great council to sit at the three feasts of Easter, Whitsuntide, and Christmas, in three different parts of the kingdom Winchester, Westminster, and Gloucester. But when the great mass of the legal business of the country was brought into the king's courts at Westminster it became necessary to take some more efficient measures for the trial of causes in the country.

The first expedient adopted was to appoint itinerant judges, justices in Eyre, who travelled through the kingdom, holding plea of all causes civil or criminal, and in most respects discharging the office of the superior courts. These itinera or Eyres usually took place after an interval of seven years.

About the end of the reign of Edward III. this system was wholly discontinued, except as to pleas of the king's forests, the functions of the justices in Eyre being superseded by the justices of Nisi Prius. This system was first established by a statute of Edward I., which, in order to prevent the expense of bringing up the juries to the king's courts at Westminster, provided that certain judges of those courts should be appointed to make circuits twice a year for the trial of issues, upon which judgment was to be given in the court above. This system is still in operation. The justices appointed by the commission of Nisi Prius also receive commissions of Oyer and Terminer and of gaol delivery, to authorise them to try criminals; and a commission of assize, under which they used to try a peculiar species of action called assizes. These actions have long been obsolete; but the name of assizes is still given to the sittings of the justices on circuit under their several commissions.

Under the Norman kings the fines, amerciaments, and forfeitures in the king's courts constituted a considerable portion of the revenue, and the administration of justice was held to be an important branch of the royal prerogative. But, like other branches of the prerogative, we sometimes find it in the hands of a subject, either by grant from the crown, or by prescription, which, in the eye of the law, supposes a grant, though such supposition is often at variance with probability; within the counties Palatine and other royal franchises, the earls or lords had regal jurisdiction, saving the supreme dominion of the king. They had the same right as the king to pardon offences; they appointed judges of eyre, assize, and gaol delivery, and justices of the peace; all legal proceedings were made in their name, and offences were said to be committed against their peace, as in other places against the peace of the king. These royal prerogatives were, for the most part, re-annexed to the crown by stat. 27 Hen. VIII.; but the form of the judicial establishment still remained. The County Palatine of Pembroke was abolished by the same statute, and the County Palatine of Hallamshire shared the same fate in the reign of Elizabeth. The Counties Palatine of Chester and Lancaster are still in existence, but have long ceased to be in the hands of subjects: they are now vested in the king. The palatinate jurisdiction of Durham continued to our own day to be possessed by the bishop, but this also has been, by statute of the year 1836, vested as a separate franchise in the king; and by another statute of the same year the secular jurisdiction of the bishop of Ely has been abolished.

But besides these palatinate jurisdictions, created to increase the power and gratify the pride of the nobles on whom they were conferred, the crown has also from time to time erected courts, with a jurisdiction limited in point of territory, and always under the control of the king's superior courts. If, in the Saxon times, the boroughs had courts similar to those of the Hundreds, there are now no traces to be found of their existence; but however that may

be, it is certain that when commerce increased, it was found of the utmost importance to the boroughs to be relieved from the jurisdiction of the feudal lord, and at the same time to have some court of justice to apply to, less distant, dilatory, and expensive, than the king's courts at Westminster. And accordingly there has, at some time or other, been granted to almost every borough of any importance, the power of exercising civil and criminal jurisdiction within certain prescribed limits. These courts were in all cases courts of record, but in other respects were not modelled on any uniform system. There was the greatest possible variety in their constitution and the extent of their powers. But the mode of proceeding in all of them was founded on the common law and the practice of the superior courts, and a writ of error lay into the King's Bench, except from the courts of London and the Cinque Ports. By far the greater number of these courts have fallen into disuse. One of the causes of their inefficiency, viz., the want of competent judges and juries, has been partially removed by the Municipal Corporation Act, and a greater uniformity has been introduced by giving to all of them jurisdiction as far as 20 $\frac{1}{2}$. But in order to bring these courts into active operation, it still remains for the legislature to provide some more simple machinery for carrying on their ordinary proceedings; to give them better means of executing process, and of compelling the attendance of witnesses; to secure the efficiency and responsibility of the inferior ministers, and to restrict the power of removing trifling suits into the superior courts. The general incompetency of inferior courts in carrying on the ordinary proceedings in a cause is attested by a plan which has lately been introduced by the legislature. Any of the courts at Westminster is authorized, when a cause commenced there has been carried through all its preliminary stages, to send it by writ of trial, to be tried before an inferior judge, and, after trial, the cause is returned, and judgment given in the superior court. If the borough courts should ever be brought into a state of activity, the system of writs of trial, which is merely a substitute for local tribunals, would probably fall to the ground.

Whenever that time shall arrive it will be a curious thing to trace the history of the administration of justice, which, under the Saxons, essentially local, rising from the smaller jurisdiction gradually to the higher, became, under the Norman dynasty, centered in one point, the monarch being the fountain of justice. This system of centralization, connected as it was with the principles of feudalism, which so long prevailed in this island with peculiar force, was elaborated, in the course of centuries, to a high state of perfection; it absorbed the remains of the antient local jurisdictions, and stunted all attempts at the establishment of new. But as the artificial systems and feudal associations, for which we are indebted to the Normans, gradually wear away, the public mind is prepared to revert to the simpler and more popular institutions which existed ages ago among our forefathers, and which seem to be peculiarly adapted to the character of the Germanic nations.

There is a great distinction between courts of record and courts not of record: courts of record are the king's courts, and have power to fine and imprison, which is not the case with courts not of record. From the judgment of a court of record there lies an appeal to the superior courts by writ of error; in courts not of record this is effected by a writ of false judgment. The county court, court baron, and hundred court, are courts not of record. The other courts of common law which we have mentioned are courts of record.

The great mass of the litigation of the kingdom is carried on by means of the superior courts of Westminster. In each of these courts there is a chief justice, and several puisne judges. In the Exchequer these are styled the chief baron and barons, no doubt bearing in their title traces of the time when their office was filled by the lords of parliament. Another remnant of the original constitution of the courts appears in the appellation of 'my lord,' which is always given to the judges in their official character.

The number of puisne judges has varied at different times. During the reigns of the Stuarts there were frequently four, but after the revolution the number seems to have been constantly three, in each court, constituting, together with the two chief justices and the chief baron, the twelve judges of England. By an act of parliament of the year 1830, a fourth puisne judge was added to each

court, making the total number of the superior judges of common law fifteen instead of twelve. But the five judges never sit all together, the full court consisting as formerly of four only.

During the terms, which are four periods in the year of about three weeks each, the three courts sit at Westminster for the determination of all questions of law; and twice a year fourteen of the judges make their circuits through England and Wales, to try, with the assistance of juries, all disputed questions of fact that arise in the country. Actions brought in Middlesex or London are tried in the same manner at the sittings which are held on certain days in and immediately after every term.

From each of the three courts there lies an appeal by writ of error to the Court of Exchequer Chamber. This is not a permanent court, consisting always of the same members; but from whichever of the three courts the appeal is made, it is brought before the judges of the other two. From the constitution of this tribunal, it is evident that where any considerable difference of opinion exists among the fifteen judges, it is incapable of effecting one of the chief purposes of a court of appeal—that of producing uniformity of decision: and, accordingly, a further appeal lies by writ of error to the House of Lords.

For the history of the courts, see Reeve's *History of the English Law*; Maddox's *History of the Exchequer*; Palgrave's *Progress of the English Commonwealth*; Allen's *Inquiry into the Prerogative*.

COUSERANS, or COUZERANS, or as it was written in the last century, CONSERANS, a district of the former province of Gascogne in France, is bounded on the east by the county of Foix, on the north and west by the district of Comminges, and on the south by the Pyrenees, which separate it from the province of Catalonia in Spain. Couserans is a mountainous district: it is watered by the Aubouigane, the Lez, the Orle, the Bordes, the Riverol, the Balameig, the Eschint or Eshint, the Aleth, the Ercé, the Courtignon, the Arac, and the Bau, all of which fall ultimately into the Salat, which carries off the whole drainage of the district into the Garonne. Couserans is now included in the department of Arriège. [ARRIÈGE.]

This district derives its name from its antient inhabitants the *Conсорanni*, or *Consuarani*. Both these names are found in Pliny, who appears to be the first Roman writer that has mentioned them: they are not noticed by Cæsar. From the difference of the names some writers have supposed the existence of two people, but M. D'Anville, with apparently good reason, rejects this supposition. It is difficult to say whether, under the Roman division of Gaul, they were comprehended in the province of Novempopulana, or that of Narbonensis Prima: perhaps they were divided between them. Their chief town, Austria, or Consoranni, has assumed, from one of its bishops, its modern designation of St. Lizier. Upon the downfall of the Roman empire, Couserans came successively into the hands of the Visigoths and the Franks. In the feudal times it ranked first as a county, afterwards as a vice-county. It does not appear to have been included in the cession of Gascogne to the English by the treaty of Bretigny. The bishopric in which this district was comprehended originated probably about the end of the fifth century: the bishop was a suffragan of the archbishop of Auch. St. Lizier, from whom the episcopal town took its name, was elected bishop about A.D. 698, and died A.D. 742. The diocese is now merged in that of Pamiers, the bishop of which is a suffragan of the archbishop of Toulouse and Narbonne.

The town of St. Lizier has a population of about 1100, according to the last edition of Malte Brun. The bishop's palace has been converted into a *dépôt de mendicité*, or poor-house. There are in the neighbourhood of the town mines of copper and lead, and beds of grey, white, and black marble. The other towns are St. Girons (population 3634 for the town, 4381 for the commune), Castillon, at the junction of the Lez and Aubouigane; and Rimont, near the Bau: with the bourgs of Seix (pop. 1564 for the town, 3822 for the whole commune) and Massat (pop. 1635 for the town, and 9322 for the whole commune). (Malte Brun; D'Anville; Prudhome, *Dictionnaire Universel de la France*.)

COUTANCES, a city in the department of Manche in France, on the banks of the little river Soule, 188 miles from Paris by Evreux, Caen, Bayeux, and St. Lo: in 49° 4' N. lat., and 1° 28' W. long. This city owes its name, and

probably its origin, to the Romans: according to the tradition of the country, it was built by the Emperor Constantius Chlorus (father of Constantine the Great), who called it after his own name Constantia, or, according to Ammianus Marcellinus, Castra Constantia, from whence by corruption is derived the modern name Coutances. Before the division of France into departments, this place was the capital of the district of Cotentin [COTENTIN], to which it gave name. There are no Roman antiquities at Coutances, except an aqueduct, said to be of Roman original, but which has been repaired since their time. The cathedral (Notre Dame) is one of the finest Gothic buildings in France; the church of St. Pierre is also worthy of notice. The population of the town in 1832 was 8957. The inhabitants carry on considerable trade in agricultural produce (especially horses); and manufacture bed-ticking, tape, and parchment.

The bishopric of Coutances originated in the fourth century. It comprehends the department of Manche. The bishop is a suffragan of the archbishop of Rouen.

Coutances is the capital of an arrondissement, having a population (in 1832) of 136,847. It has a *tribunal de commerce*.

COUTHON. [COMMITTEE OF PUBLIC SAFETY.]

COUTRAS, a small town in the department of Gironde, at the confluence of the Dronne and the Isle. Here the Huguenots, under Henri of Navarre, afterwards Henri IV. of France, defeated the army of the French King Henri III., under the duke of Joyeuse, who fell in the action, 20th October, 1587.

COUVIN. [NAMUR.]

COVE, is a small inlet on a rocky coast. When the indentation is wide and deep enough to admit vessels of fifty tons burden and upwards, it is called a harbour; but when it is too narrow for that purpose, and can only be entered by small craft, it is called a cove.

COVENANT is a written agreement, by deed under seal, between two or more persons, whereby some act is agreed to be done; or, upon the happening of some event, some charge or liability is agreed to be borne by some party thereto. The person entering into the agreement, and subjecting himself to the penalty of its breach, is called the covenantor, and the person with whom it is made, the covenantee. The portion of the agreement which expresses the character of the liability of the covenantor is called the lien.

Covenants take many varieties of forms, and are variously stated. They usually arise from the express words of the parties, but any words denoting the intention are sufficient; as, 'I agree,' 'I am content.' They are sometimes inferred, by law, from the relation of the parties or from the nature of their contract. Thus a demise for a term of years, will sustain, upon an implied covenant, an action for quiet enjoyment.

The lien of covenants usually contains introductory words, declaring the extent of the covenant. If there are several covenantors, it usually declares the covenant to be several, or joint, or joint and several. In case the covenant is several, each of the covenantors covenants for himself alone, and may be sued alone; if joint, each of the covenantors covenants for himself as well as for each other, and all must be sued together; if joint and several, each party covenants for himself, and as a surety for those with him, and an action, in this case, may be brought against one of the covenantors only, or, against all. The courts however, even in these cases, regard the interests of the parties; and if the interest, or cause of action, is joint, the action must be brought against all the covenantors, though the terms of their covenant may be joint and several; and if the interest, or cause of action, is several, though the covenant is joint, the parties must be severally sued. The reason is, that difficulty would arise if judgment in distinct actions should be asked for one and the same cause against several persons, or against persons whom there is no cause of action to affect. The mere terms of a covenant are not therefore a sufficient guide to determine the propriety of joining parties in an action upon it.

Covenants are divided into real and personal, though, as now used, they are as to remedy, chiefly personal.

The former affect realty, and may bind the real estate of the covenantor in the hands of the heir and of his assigns. Personal covenants bind only the covenantor, or his executors and administrators, that is, his personal estate in their hands. The objects of real covenants are generally to

afford some specific advantage or protection to those into whose hands the realty to which they relate shall pass; or, to secure the performance of some specific duty by those who may possess the realty to which they relate.

In the construction of all covenants the intention of the parties is regarded. The general rules usually laid down for this purpose depend upon the presumed intention of the parties; and for this reason, a statute declaring the effect of certain covenants, and enabling them to be stated in a few words, has long been desired, in order to shorten the length of conveyance and to avoid litigation. By such a measure the express intention of the parties would always appear in deeds, by their adoption of the abbreviated language of the law, or by their restraining its general effect. Indeed, in the statutes relating to the registry of deeds in Yorkshire, it is declared that the words 'grant, bargain, and sell' are to operate as covenants for title; for farther assurance, and for quiet enjoyment.

The intention of the parties, however, is not always sufficient, in the case of real covenants, to secure their object. It is frequently desirable, when the possession of land is parted with, that the purchaser and his assignees should always be able to resort to the vendor or to his heirs for protection, or that the purchaser and his assignees should perform certain duties, and that the covenants for these purposes should always be connected with the party enjoying the land, or, in other words, that such covenants shall 'run with the land.' In order that this shall occur, the mere intention of the parties, however definitely expressed, is insufficient; there must also be privity of estate. When land mortgaged in fee was demised by the mortgagor, a covenant entered into with him was merely personal; for though in equity the owner of the estate, at law the mortgagor is a mere stranger to it: there was no privity of estate between the lessor and lessee. (*Webb v. Russell*, 3 Term Rep., 402, 678; 1 Hen. Blackstone, 562.) The assignee also must come in of the same estate as his assignor, or the covenant will also be merely personal. Thus, a covenant to pay a fee farm rent, in a deed enabling the purchaser to appoint his estate to uses, became a mere personal covenant by the exercise of the power to appoint, for the appointment did not convey the same estate that the purchaser had acquired. (*Roach v. Wadham*, 6 East. 289.) [USES.] The Real Property Commissioners have stated three rules respecting covenants running with the land.

1. A covenant to run with the land so as to bind the assignee, or to give to him the benefit of it without his being named, must relate directly to the land, or to a thing parcel of the demise: such is a covenant to pay rent, to keep buildings in repair, or to observe particular modes of cultivation. 2. When it respects a thing not in existence, but which, when it comes into existence, will be annexed to the land, the covenant will bind the assigns by naming them, but will not bind them unless named: such is a covenant to erect buildings, or to plant trees. 3. When it respects a thing not annexed, nor to be annexed, to the land, or a thing merely collateral, or in its nature merely personal, the covenant will not run, that is, it will not bind the assignee, nor pass to him, even though named: such as a covenant to haul coals to the lessor's house, to grind corn at his mill, or to buy or sell stock in a certain manner. These rules, however, though originally laid down with reference to leases, have been treated as applying to cases not involving the relation of landlord and tenant. They involve many subtle distinctions, and it has been proposed that all covenants, of whatever nature or for whatever purpose, should, unless a contrary intention is expressed, or may be inferred from the instrument, bind the assignee of terms.

The Law Commissioners also divide covenants where the relation of landlord and tenant, or lessee and reversioner, does not exist, into three classes. 1. Covenants made *with* the owner of the land to which they relate; as covenants for title, to indemnify from existing charges, for farther assurance, &c., which supply the old remedy of warranty, with the difference, that pecuniary damages, instead of the recompense of land, are obtained under them. 2. Covenants made by the owner of the land to which they relate; as to build on certain land, to keep up a road, to keep a space of ground open. 3. Covenants relating to the production of writings and title-deeds; as in cases where an estate is divided into fractions and sold to different persons, one of the purchasers, usually the purchaser of the most valuable

share, holding the deeds and writings. It has been contended that a covenant by the owner of land respecting the land should always run with the land; but this doctrine has not been established, and if sanctioned, might give an injurious control over property for an indefinite period.

At common law, none but parties or privies, by contract or estate, could take advantage of covenants, or be bound by them. Upon the dissolution of monasteries, great evils were found to follow from this state of the law, the lands then seized by the crown, and afterwards transferred to patentees or grantees of the crown, being leased under covenants, which ceased to be binding by the absence of any privity between the lessees of the church lands and the new owners of such lands. To correct these evils the 32 Hen. VIII. c. 34, was passed, which gave to the grantees of reversions generally, and to the grantees and patentees of the crown the same advantages and remedies as were possessed by the original lessors or grantors of the land. The statute placed the parties to whom it applied in the position of those who were privy to the original contract. To covenants, however, merely collateral, the statute does not apply; that is, if the covenant is beneficial to the lessor, without regard to his continuing the owner of the estate, it is a collateral covenant, upon which the assignee of the reversion cannot sue. The assignee of the reversion, however, is entitled to the benefit of all covenants entered into by a lessee with the lessor, his heirs and assigns, provided such assignee be the owner of the reversion immediately expectant on the term, and provided the estate he has be the same estate which, or a portion of which, the lessor had at the time of granting the lease. If there be a title paramount by escheat or otherwise, the covenant is at an end, if such title defeats the lessor's estate.

It was a common practice, in order to secure the performance of a covenant, to take a bond as an additional security. It enabled the obligee to elect between an action of debt for the penalty of the bond, or to proceed upon the covenant. The reason of the practice was, that at common law a devisee of the real estate of the covenantor was not liable to an action for a breach of covenant, though by the statute of fraudulent devises (3 W. and M. c. 14), he was liable to an action for breach of the condition of the bond. This is now remedied by the 1 W. IV. c. 47, which extends the provisions of the 3 W. and M. to the case of a covenant.

By the 3 and 4 W. IV. c. 42, actions on covenants must be brought within twenty years after the cause of action has arisen.

Covenants may be discharged by a release, by their performance, by the destruction of the seal, or by the destruction of the interest upon which the covenant depends. They may be void at the time of their creation upon account of the personal incapacity of one of the parties to contract, as being an idiot or a lunatic, or upon account of their object being illegal, as relating to bribery, gaming, illegal insurances, lotteries, sales of offices, simony, smuggling, stock-jobbing, usury, or to wagers. They will also be void if opposed to public policy, as not to trade generally, though a covenant not to trade in a particular place, or with a particular person, would be valid.

COVENANT and COVENANTERS. [CAMERONIANS.]

COVENTRY, a city locally situated in the hundred of Knightlow, in the county of Warwick, of which however it forms no constituent portion; having been made, with several adjacent villages, a separate county, by an act of Henry VI. in 1451, and entitled the County of the City of Coventry. The city, exclusive of the suburbs, is about three quarters of a mile in length, and stands on a small elevation which slopes gradually towards the east and west. The situation is nearly in the centre of the kingdom, on a level tract, which, near Coventry, is about 300 feet above the sea level; 91 miles N.N.W. from London, and 10 N.N.E. from Warwick. It is a place of great antiquity, but its origin appears to be only obscurely known. By some writers it is asserted and by others denied that the name is derived (as Covent Garden from Convent Garden) from a spacious convent which was founded, says Leland, by king Canute, and was destroyed by the traitor Eðric in 1016. However this may be, it is certain that in the reign of Edward the Confessor, in 1044, earl Leofric, a powerful lord of the large territory of Mercia, with his wife, the lady Godiva, founded at Coventry a magnificent Benedictine

monastery, and appropriated to it half the town and twenty-four lordships, besides enriching it with a profusion of rich presents. The capacious cellar of the monks still exists, measuring 75 yards in length by 5 in breadth. From the date of this religious establishment the prosperity of the place appears to have taken its rise. After the Conquest the lordship of Coventry came to the earls of Chester. Leland, writing in the reign of Henry VIII., says that the city was begun to be walled in in the time of Edward II., and that it had six gates, many fair towers, and streets well built with timber. Other writers speak of thirty-two towers and twelve gates. The walls were demolished by Charles II. in consequence of the active part taken by the citizens in favour of the parliamentary army. During the monastic ages Coventry had a large and beautiful cathedral, similar to that at Lichfield. At the Reformation it was levelled to the ground by order of Henry VIII., and only a fragment or two now remain. There are three antient churches, of which St. Michael's is by far the most remarkable for architectural beauty and ornament. It was originally built in 1133, in the reign of Henry I., and was given to the monks of Coventry by Ranulph earl of Chester, in the reign of Stephen. Sir Christopher Wren is said to have considered this church a masterpiece of the lighter Gothic style. The spire rises finely tapering out of an octagonal prism upon the tower, and its summit is 303 feet from the ground. The interior is lofty and finely ornamented with rows of clustered pillars and arches, with a roof of curiously carved oak and numerous windows of antient coloured glass. (*Description of St. Michael's Church*, by William Reader, Coventry.) Trinity church is a Gothic edifice, but heavier and less elegant than St. Michael's. The height of its spire is 237 feet. St. John's is a plain cruciform structure, founded in the reign of Edward III. A handsome new church has been built under the parliamentary commission. One of the richest and most interesting vestiges of the ornamental architecture of the fifteenth century in Coventry, and perhaps in England, is a capacious building called St. Mary's Hall, erected in the reign of Henry VI. The principal room is 63 feet by 30, and 34 feet in height. Its grotesquely carved roof of oak, the gallery for minstrels, the armoury, the chair of state, and especially the great painted window facing the street, are admirably suited to furnish a vivid idea of the manners of the age in which Coventry was the favourite resort of princes. A tapestry made in 1450, measuring 30 feet by 10, and containing 80 figures, is a curious and beautiful specimen of the drawing, dyeing, and embroidery of that period. This hall is the property of the corporation, and is used as a council chamber, and for civic festivities. (*Guide to St. Mary's Hall*, by William Reader, Coventry.) In the marketplace a richly ornamented Gothic cross, considered one of the finest in the country, was erected in the sixteenth century, and taken down in 1771 to gratify the bad taste of the inhabitants. It was hexagonal, 57 feet high, with eighteen niches of saints and kings. (Gough's *Brit. Topog.*, vol. ii., p. 303.) The hospital in Gray Friars' Lane is very antient, and richly ornamented with carved oak. The building called the Mayor's Parlour is of the sixteenth century: it is used for judicial purposes.

Coventry has been the seat of two parliaments; one held by Henry IV. in 1404, called *Parliamentum Indoctum*, from being composed of laymen inimical to the interests of the clergy, or, as some writers say, from the fact of lawyers being excluded. The other by Henry VI. in 1459, called *Parliamentum Diabolicum*, from the numerous attainders it issued against the Duke of York and his adherents.

Froissart and Holinshed give a graphic account of the combat at Coventry of the Duke of Norfolk and the Duke of Hereford, afterwards Henry IV. See also Shakspeare's *Richard II.*

Coventry has been always renowned for its exhibition of pageants and processions; and in the monastic ages it was remarkable for the magnificent and costly performance of the religious dramas called Mysteries. Accounts are extant of these solemn shows as early as 1416. They were performed on moveable street-stages chiefly by the Gray Friars, on the day of Corpus Christi. The subjects were the Nativity, Crucifixion, Doomsday, &c., and the splendour of the exhibitions was such that the king and the royal family, with the highest dignitaries of the church, were usually present as spectators. (See *A Dissertation on the*

Pageants or Dramatic Mysteries antiently performed at Coventry, and other Municipal Entertainments, by Thomas Sharp, 4to., 1825.) The plates in this work are extremely interesting, and the facts are valuable as indicating the great progress of society since the time when kings and prelates witnessed with gratification and applause what would now shock the feelings and be condemned by the judgment of the humblest member of society. The following items from a bill of expenses inserted in the work just mentioned, will give an idea of these dramatic personæ:—'Payd for 2 pound of hayre for the divill's head, 3s.; mending his hose, 8d. Black canvas for shirts for the damned, 4s. Red buckram for wings of angels (represented by naked children), 7s. Paid for a cote for God, and a payre of gloves, 3s.' The following work also contains much curious information: 'The Pageant of the Company of Sheremen and Taylors in Coventry, as performed by them on the festival of Corpus Christi, with other Pageants at Coventry, on the visit of Henry VI. and his Queen in 1455; of Prince Edward in 1474; of Prince Arthur in 1498, &c.; with the Verses recited in character on those occasions.' By W. Reader, Coventry. Other writers give descriptions of the costly pageants exhibited to Henry IV., Henry VII., and several other kings. Coventry was the favourite residence of Edward the Black Prince. Here also Queen Elizabeth delighted to see 'The game of Hock Tuesday,' which represented the massacre of the Danes by the English in 1002, and it was for her especial amusement that, in addition to a ring for baiting bulls, another was put down for badger-baiting, her favourite sport. The peculiar predilection of the people of Coventry for gorgeous pageantry is still displayed in the celebrated processional show at the great fair on the Friday in Trinity week, when many thousands assemble to see the representative of lady Godiva. The legendary origin of this singular exhibition is as follows: Earl Leofric had subjected the citizens of Coventry to a very oppressive taxation, and remaining inflexible against the entreaties of his lady for the people's relief, he declared that her request should be granted only on the condition that she should ride perfectly naked through the streets of the city; a thing which he supposed to be quite impossible. But the lady's modesty being overpowered by her generosity, and the inhabitants having been enjoined to close all their shutters, she partially veiled herself with her flowing hair, made the circuit of the city on her palfrey, and thus obtained for it the exoneration and freedom which it henceforth enjoyed. The story is embellished with the incident of Peeping Tom, a prying inquisitive tailor, who was struck blind for popping out his head as the lady passed. His effigy is still to be seen protruded from an upper window in High Street, adjoining the King's Head tavern. In Gough's edition of Camden's 'Britannia,' (vol. ii. p. 346) it is stated that Mathew of Westminster, who wrote in 1307, that is, 250 years after the time of Leofric, is the first who mentions this legend, and that many preceding writers who speak of Leofric and Godiva do not notice it. In Rudder's 'Gloucestershire,' p. 307, a similar legend is said to be related of Briavel's Castle. The Coventry procession, as at present exhibited, began only in the reign of Charles II., in 1677: it consists principally of Saint George of England on his charger, lady Godiva, a female who rides in a dress of flesh-coloured muslin, with flowing hair, on a beautiful gray horse; then follow the mayor and corporation, the whole of the city companies, the wool-combers, knights in armour, Jason, bishop Blaize, &c. &c., all in splendid dresses, with a great profusion of brilliant ribands, plumes of feathers, and numerous bands of music. (*The History and Description of Coventry Show Fair, with the History of Leofric and Godiva.* By W. Reader.)

The county from N.E. to S.W. measures about eight miles, and from E. to W. about seven miles, containing an area of 18,161 acres. The soil is fertile, and chiefly laid out in pasturage. It is of a red colour, and rests on the red sand-stone of the district. The county, besides the city and suburbs, consists of the parishes of Foleshill, Exhall, Anstey, Stoke, Stivichall, with part of Stow and Shelton. These parishes include a total of nineteen villages and hamlets, some of which are very populous, but they have no share in the civil and political privileges of the city. The city, under the Municipal Corporation Act, is divided into six wards, governed by a mayor, twelve aldermen, and thirty-six councillors.

The assizes are regularly held in the city, and quarter-

sessions are held, of which the recorder is sole judge, besides which there are various other courts.

Besides the patronage of many important appointments, the corporation had formerly the distribution of charitable funds amounting to 7300*l.* per annum. The following are the principal institutions of this kind, which in Coventry are very numerous. Sir Thomas White's charity, founded in the reign of Henry VIII., produces annually between 2000*l.* and 3000*l.* The Bablake Men's Hospital, of which an income of about 1500*l.* is devoted to the maintenance of poor and aged men, was founded by the will of Thomas Bond, in 1506. The Bablake Boys' Hospital has an income of about 940*l.*, appropriated to the maintenance and education of young and poor boys. Besides these, there are twelve other considerable charities, and several minor ones. A full account of these charities is given in the 'Reports on Charities.'

The free school is a richly endowed institution founded by John Hales in the reign of Henry VIII. Here Sir William Dugdale and several other eminent men were educated. The income is about 900*l.* per annum; and the school has two fellowships at St. John's Coll., Oxford, one at Catherine Hall, Cambridge, and six exhibitions at either university. It appears from the Charity Commissioners' Reports, that the school was grossly mismanaged at the time of the inquiry; the fine school-room was locked up, and the books of its library, which had not been used to light the fire with, were missing or torn and covered with mould. Since that time a new head-master has been appointed, and at present the school is again attended by a number of pupils. There is a large Lancasterian school, Sunday schools, and several good private academies; with places of worship for Catholics, Presbyterians, Unitarians, Independents, Baptists, Methodists, and Quakers. The general appearance of the town is gloomy and crowded; many of the streets being narrow, and darkened by the projection of the upper stories of houses built in the fifteenth and sixteenth centuries. The city retains its antient limits; any enlargement of which is prevented by the surrounding commons, called the Lammas Lands, on which the freemen have the right of pasturing their horses and cows. The streets are lighted and watched at night, but are not generally paved, or supplied with public sewers. In addition to the buildings already noticed, may be named the County Hall, a stone edifice erected in 1785, and the Draper's Hall, which is ornamented with Tuscan pilasters, and is elegantly fitted up for assemblies and other public entertainments. The gaol has recently been rebuilt by the corporation at an expense of above 16,000*l.*

In the time of the Edwards and Henries the tradesmen of Coventry were famed for their affluence. In 1448 they equipped 600 armed men for the public service. Until the war between England and France in 1694, the staple manufacture was woollens, broad-cloths, and caps; and previous to 1580 there existed a famous manufacture of blue thread, the water of the small river Sherbourn, which passes through the city, being an excellent menstruum for dyeing this colour. During the eighteenth century there was a flourishing manufacture of tammies, camlets, shalloons, calimancoes, gauzes, &c., but it is no longer continued. At present the staple manufactures are ribbons and watches. The former was introduced about 1730, and in 1830 the number of individuals to whom it afforded employment in the city and adjacent villages is said to have been about 16,000, the number of looms being nearly 3000. Of late years this manufacture has not been so prosperous, for which one of the reasons assigned is the fact of a great portion of the proprietary manufacturers residing in London. (See *Report on Manufactures*.) The manufacture of watches was introduced about 1800, and has become so extensive that the annual number manufactured is equal to that of London. The local position of Coventry is favourable for commercial operations, being nearly central between the four greatest ports of England—London, Bristol, Liverpool, and Hull; possessing great facilities of water communication by the Coventry and Oxford canal, which opens into the Grand Trunk navigation, and having one of the main roads from London to Birmingham passing through its streets.

There are several guilds, or incorporated trading companies, some of which are possessed of considerable property, which they spend in charity and festivities. The city of Coventry sends two members to parliament. The elective

franchise was first granted in the reign of Edward I. The number of electors since the Reform Act, is 5000. The population of this city in 1377 was 7000, at which time there were only 18 towns in the kingdom having 3000 inhabitants. In 1831 the population was 27,070, of whom 204 families were employed in agriculture, and 4913 in trade and manufactures. There is a weekly market on Friday, and fairs on the second Friday after Ash Wednesday, May 2nd, Friday in Trinity week, August 26th and 27th, and November 1st, for the manufactures of the city, and for cattle.

(*Antiquities of Warwickshire*, by Dugdale; *History and Antiquities of Coventry*, 12mo., 1810; *New Coventry Guide*, by W. Reader.)

COVERDALE, MILES, bishop of Exeter, a native of Yorkshire, was born in 1487. He was educated in the house of the Augustine friars in Cambridge, of which Dr. Barnes, afterwards one of the Protestant martyrs, was then prior. Whether he took a degree at the University of Cambridge in early life seems uncertain; but Godwin says he afterwards received the degree of D.D. from the University of Tübingen, and was, though later in life, admitted *ad eundem* at Cambridge. Being in his early years attached to the religion in which he was brought up, he became an Augustine monk. In 1514 he entered into holy orders, and was ordained at Norwich; but he afterwards changed his religious opinions. Bale says he was one of the first who, together with Dr. Robert Barnes, his *quondam* prior, taught the purity of the gospel, and dedicated himself wholly to the service of the Reformation. About this time, probably 1530 or 1531, the reformed religion began to show itself at Cambridge, where various eminent men, and Miles Coverdale amongst them, began to assemble for conference on those points which had been discussed by the reformers abroad. In 1532 he appears to have been abroad, and assisted Tyndale in his translation of the Bible; and in 1535 his own translation of the Bible appeared, with a dedication to King Henry VIII. It formed a folio volume, printed, as Humphrey Wanley (Lord Oxford's librarian) thought, from the appearance of the types, at Zürich, by Christopher Frochover. He thus had the honour of editing the first English Bible allowed by royal authority, and the first translation of the whole Bible printed in our language. The Psalms in it are those now used in the Book of Common Prayer. About the end of the year 1538 Coverdale went abroad again on the business of a new edition of the Bible. Grafton, the English printer, had permission from Francis I., at the request of King Henry VIII. himself, to print a Bible at Paris, on account of the superior skill of the workmen, and the goodness and cheapness of the paper. But, notwithstanding the royal license, the Inquisition interposed by an instrument dated December 17, 1538. The French printers, their English employers, and Coverdale, who was the corrector of the press, were summoned before the inquisitors, and the impression, consisting of 2500 copies, was seized and condemned to the flames. The avarice of the officer who superintended the burning of the copies, however, induced him to sell several chests of them to a haberdasher, for the purpose of wrapping his wares, by which means a few copies were preserved. The English proprietors, who had fled at the alarm, returned to Paris when it subsided; and not only recovered some of the copies which had escaped the fire, but brought with them to London the presses, types, and printers. This importation enabled Grafton and Whitchurch to print, in 1539, what is called Cranmer's, or 'The Great Bible,' in which Coverdale compared the translation with the Hebrew, corrected it in many places, and was the chief overseer of the work. Coverdale was almoner, some time afterward, to Queen Catherine Parr, the last wife of Henry VIII., at whose funeral he officiated in the Chapel of Sudeley Castle in Gloucestershire in 1548. On August 14th, 1551, he succeeded Dr. John Harman, otherwise Voysey, in the see of Exeter. On his appointment to this bishopric, Coverdale was so poor as to be unable to pay the first fruits, which therefore the king, at the solicitation of Archbishop Cranmer, excused. On the accession of Queen Mary, and the consequent re-establishment of Catholicism, he was ejected from his see, and thrown into prison, out of which he was released after two years' imprisonment, at the earnest request of the king of Denmark, whose chaplain, Dr. John Machabæus, had married the sister of Coverdale's wife. On his release, which was on the condition of banishing him-

self, Coverdale repaired to the court of Denmark; he went afterwards to Wesel, thence to Bergzabern, and finally to Geneva, where he joined several other English exiles in producing that version of the English Bible which is usually called 'The Geneva Translation;' part of which, the New Testament, was printed at Geneva in 1557, by Conrad Badius, and again in 1560, in which last year the whole Bible was printed in the same place by Rowland Harte. On the accession of Queen Elizabeth, Coverdale returned from exile; but having imbibed the principles of the Geneva reformers, as far as respected the ecclesiastical habits and ceremonies, he was not allowed to resume his bishopric, nor was any preferment offered to him for a considerable time. In 1563 Bishop Grindal recommended him to the bishopric of Llandaff; but it is supposed that Coverdale's age and infirmities, and the remains of the plague, from which he had just recovered, made him decline so great a charge. In lieu of it, however, the bishop collated him to the rectory of St. Magnus London Bridge. He resigned this living in 1566. The date of his death has been variously stated. The parish register of St. Bartholomew, behind the Royal Exchange, however, proves that he was buried February 19th, 1568, in the chancel of which church a Latin epitaph remained for him, till it was destroyed along with the church in the great fire of 1666. Coverdale was the author of several tracts calculated to promote the doctrines of the Reformation, and of several translations from the writings of the foreign reformers: a list of no fewer than seventeen of these will be found at the end of Coverdale's life in Chalmers's *Biographical Dictionary*, which is our authority for the greater part of the facts here mentioned. (See also Strype's *Lives of Cranmer, Parker, and Grindal*; his *Memorials and Annals*; and Tanner's *Bibliotheca Britannico-Hibernica*.)

The third centenary of the publication of Coverdale's Bible was celebrated by the clergy throughout the churches of England, October 4th, 1835: and several medals were struck upon the occasion.

COVERED-WAY, a road surrounding a fortified post along the side of the ditch which is opposite to the ramparts. It is usually about 30 feet broad, on the level of the natural ground, and is protected by the mass of earth called the glacis. Its situation is indicated by the unshaded space above the line R R in the article **BASTION** (*fig. 1*). As the works of a fortress form a series of angles which are alternately re-entering and salient, the covered-way necessarily changes its direction at each angle; and the spaces which are there formed by its branches (as at L and above the curve line at E in the article and figure above cited) are respectively designated 're-entering and salient places of arms.'

Under the name of *orlo* the covered-way is met with in the writings of the first Italian engineers, and it is said to have been invented by Tartaglia in the 16th century.

In the defence of a fortress this work is of great importance. A constant fire may be kept up from thence while the trenches of the besiegers are being slowly executed on the surface of the glacis; and in the systems of Vauban and Cormontaigne it is purposely made so narrow as to render the construction of a breaching battery upon it impossible, except by the tedious operation of removing a large part of the glacis.

Without the covered-way, troops making a sortie would, after having crossed the ditch, be scarcely capable of deploying under the fire of the enemy; and, in retreating, if pursued, they might be cut in pieces on the counterscarp before they could descend into the ditch, or gain, by the bridges, the posterns of the fortress; whereas by the sally-ports, or by steps temporarily formed along the interior side of the glacis, the departure from, or the return to, the covered-way is readily accomplished by a large body of troops.

An attack on the covered-way is, moreover, a difficult enterprise, and is usually attended with great loss to the besiegers: the thickness of the glacis renders it impossible to facilitate the assault by forming a breach in it; a grazing fire of musketry from the covered-way disorders the assailants during their approach; and, when arrived at the crest of the glacis, one, and sometimes two rows of palisades form a serious impediment to a descent into the work. Even if an entrance should be gained, the assailants are confined between the traverses and annoyed by the fire of the defenders who have retired behind them, or by a

plunging fire from the parapets of the fortress. It is easy to conceive, therefore, that such an attack will scarcely be made unless those fires have been previously in part silenced, and the palisades in the covered-way deranged by a fire of guns or howitzers from the enfilading batteries.

COVERTURE. [WIFE.]

COW, one of the most useful of the domestic animals. Her milk is peculiarly adapted to nourish infants and invalids, and requires no preparation to make it palatable or wholesome. In the article CATTLE we have given an enumeration of the various breeds of cows; and under BUTTER and CHEESE an account of their principal produce. We shall here confine ourselves to the proper management of a cow, so as to make her most productive; and to the most common diseases to which this animal is subject.

Where only one or two cows are kept, especially where they are to be maintained on a limited portion of pasture, it is of great importance that a good choice be made when they are purchased or reared. Some breeds no doubt are much superior to others; but as a general rule, there is a better chance of having a profitable cow, if she be reared on the land on which she is to be kept. When the common breed of the country is decidedly inferior, it may be profitable to bring a cow from a distance, in which case it should be from some district of which the pasture is rather inferior to that to which she is brought, or at least not better. The best breeds are found in the richest pastures, but they do not thrive on worse. On poor land a small active cow will pick her food and keep in condition, where a fine large cow would starve, or at least fall off rapidly. This is particularly the case in the mountains, near the tops of which no domestic animal will live but the goat, and next to it the smallest breed of cows. Where the pastures are poor but extensive, cows give little milk, and the number which can be kept must make up for the produce of each. Where, on the other hand, cows are stalled, as in Flanders, and fed on artificial food brought to them in sufficient quantity, large bulky cows give the best return for the food; at least this seems to be the opinion of the Flemish farmers in general. In France, where the cows are led along the roads to pick up the herbage growing by the road-side, or are tethered on a small portion of clover or lucern, a small lean cow is preferred; and in general the cows commonly met with, and which are bred in each district, seem the best adapted for the mode in which they are fed. Whatever be the breed or quality of a cow, she should always have plenty of food, without which no considerable produce in milk can be expected. This food should be succulent as well as nourishing, or else fat will be produced instead of milk. A cow well fed may be safely milked till within a month of her calving. It is better that she should be dry before the new milk begins to spring in her udder. A little attention will readily prevent her becoming dry too soon, or being milked too long. Heifers with their first calf should be allowed to go dry sooner than older cows; because their growth would be impeded by the double drain of the milk and the calf. It is best to let a heifer go to the bull when nature prompts her to it, provided she be not less than fifteen or eighteen months old; for if they are thwarted in their first heat, they are apt to become irregular ever after; and it is advantageous for a cow to calve regularly at the same season of the year. The best time is May, when the grass begins to be succulent. In some countries, such as Switzerland, the cows calve regularly in April or May, and are then sent to the pastures among the mountains. The calf is killed almost immediately, unless it be reared for stock, veal being of little value. In populous countries where veal is considered a luxury, the calves are kept and fattened by letting them suck the cows, or by giving them warm milk to drink. Near large towns this is a profitable mode of employing the milk, when it cannot be sold for immediate consumption. [CALF.]

A cottager with two or three acres of moderate land may keep a cow, and thus add much to his earnings as a labourer. For this purpose he will require a small portion of permanent grass fenced off, to allow the cow to take exercise, which is necessary to her health. Her food must be raised in regular succession, and cut for her. The earliest green food is rye; then tares; then clover, which may be made so to succeed each other as to give an ample supply. Cabbages, beet-root, parsnips, potatoes and turnips, will continue the supply during winter; and the dung and urine

of the cow carefully collected, will be sufficient to keep the land in condition. This system, lately introduced into some parts of Ireland, has already greatly improved the condition of the industrious poor. There is very good advice on this management in Cobbett's *Cottage Economy*, a useful little publication.

Where cows are allowed to be in the open air, with proper shelter in case of stormy and wet weather, they are subject to few diseases. They must be carefully looked to at the time of calving, but except in urgent cases nature must be allowed to perform her own office. A little common sense and experience will soon teach the possessor of a cow to assist nature, if absolutely necessary; and in case of difficulties the safest way is to call in an experienced person. Drinks and medicines should be avoided; a little warm water, with some barley or bean meal mixed with it, is the most comfortable drink for a cow after calving. The calf, and not the cow, should have the first milk, which nature has intended to purge its intestines of a glutinous substance which is always found in the new-born calf. A very common disease with cows is a disordered function of the liver, producing a yellowish tint in the eyes, and sometimes in the skin. A gentle purge, consisting of half a pound of Glauber salts, an ounce of ginger, and two ounces of treacle, with two quarts of boiling water poured over them, may be given when it is milk-warm, and repeated every other day; keeping the cow warm, if it be in winter, by a cloth over the loins, and in a shed. This will in general restore her health. Should the cow appear to have a chronic affection, the safest course for a cottager is to part with her at any price to those who may be better skilled in curing diseases; for it is seldom that a cow is worth the expense of the farrier's attendance in such cases. The symptoms of a diseased liver or lungs in a cow are leanness, with a staring coat, a husky cough with loss of appetite, a difficulty of breathing, and a great diminution in the secretion of the milk. The first loss by the sale of the cow is always the least in the end. In accidents, or acute diseases, the attendance of a clever veterinary is indispensable.

Nothing is more prejudicial than the idea that medicines are necessary to keep cows in health; and the practice of keeping advertized medicines at hand to give to an animal whenever it is fancied to be ill, is very detrimental to their health. Attention to food and exercise, giving the first regularly and in moderate quantities at a time, and allowing the cow to use her own judgment as to the latter, are the great secrets of health; and a healthy young cow reared at home, or purchased of a conscientious dealer, will probably live to old age without ever having had any disease. A cow is old and unprofitable when she reaches twelve or fourteen years. She should then be sold and a young one purchased. If the cottager have the means of rearing a cow-calf to succeed the old mother, he will do well; if not, he must lay by a portion of the cow's produce every year to raise the difference between the value of the old cow and a young one. The saving banks are admirable institutions for this purpose: a few shillings laid by when the produce of the cow is greatest, will soon amount to the sum required to exchange an old one for a younger.

COW-TREE, a plant little known, belonging to the natural order Urticaceæ, and apparently to the genus Brosimum, from which, when wounded, a milky nutritious juice is discharged in such abundance as to render it an important object to the poor natives in whose country it grows. It is described by Humboldt as being peculiar to the Cordilleras of the Coast of Caracas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in the valley of Caucagua, three days' journey east of Caracas. In these places it bears the name of *Palo de vaca* or *arbol de leche*, and forms a fine tree resembling the star apple of the West Indies. 'Its oblong pointed leaves, rough and alternate, are marked by lateral ribs, prominent at the lower surface and parallel; they are, some of them, ten inches long.' Its flowers and fruit have not been seen by any botanist. From incisions in its trunk flows a glutinous milk, similar in consistence to the first milk yielded by a cow after calving. It has an agreeable balsamic smell, is eaten by the Negroes, who fatten upon it, and has been found by Europeans perfectly innocuous. In chemical characters it is remarkably similar to the milk of animals, throwing down a cheesy matter, and undergoing the same phenomena of putrefaction as gelatine.

Humboldt supposed the cow-tree to belong to the Sapotaceous order, but, though little has been added to our knowledge of it since his visit to the Caracas, it is at least certain that it is either a species of *Brosimum* or very nearly related to it, and consequently a member of the Urticaceous order.

The latter circumstance renders the cow-tree still more interesting; for the milky juice of Urticaceous plants is in other cases highly poisonous. But botanists are now acquainted with many instances of innocuous plants in poisonous orders; thus the hya-hya tree of Demerara, for instance, belonging to the deadly Apocynaceous family, yields a thick rich milky fluid destitute of acrimony; and the Kiriaghuna plant of Ceylon is a sort of East Indian cow-plant, notwithstanding it belongs to the Asclepiadaceous order which is acrid and dangerous. In the absence of precise information as to the circumstances under which the cow-trees are milked, it is impossible to say what is the cause of their harmlessness; but every physiologist will see that it is capable of being explained without difficulty in more ways than one.

COWES. [WIGHT, ISLE OF.]

COWITCH, or COWAGE, a word of unknown derivation, unless it be a corruption of *Al Kooshee*, the Bengâli name of one of the plants that produces it, consists of the hairs found upon the pods of different species of *Mucuna*. They are exceedingly slender, brittle, and easily detached, and the fragments readily stick into the skin and produce an intolerable itching; hence they are frequently employed for mischievous purposes. Cowitch is also used medicinally as a vermifuge, by being mixed with syrup till of the consistence of honey, and given in doses of two or three teaspoonsful.

The plants that bear these pods are large twining annuals or perennials, with leaves like those of kidney beans, dark purple papilionaceous flowers, with a short standard lying close upon the wings and keel, and diadelphous stamens, half of which have round and half arrow-headed anthers. The pods contain from one to six seeds, and are covered by a very wrinkled shrivelled skin, which even stands up in little plates. Before they are ripe and their hairs hardened, the pods are employed as a vegetable, like kidney beans, and are described as being delicious. The species are found in hedges, thickets, on the banks of rivers, and about water-courses in both the East and West Indies, and America within the tropics. *Mucuna urens* and *pruriens* usually furnish the substance; but that from *M. monosperma*, called by the Telingas *Enooga doola gunda*, or Elephant's Scratch-wort, is said to exceed the others in the irritating burning property of its hairs. Dr. Roxburgh states that *M. pruriens* was one of the plants formerly used in India to poison wells; 'it has turned out however not to be the poison it was taken for, and it is more than likely that the other plants employed for the same base ends are fortunately much less dangerous than those who employ them imagine.'

[Cowitch.]

Opened pod of *M. monosperma*, the Elephant's scratch-wort—natural size.

COWLEY, ABRAHAM, the son of a grocer resident in Fleet Street, London, was born in 1618, and educated at Westminster School, and Trinity College, Cambridge. He was an early poet, and attributes the direction of his genius to the perusal of Spenser, whose works, he says, 'were wont to lye in his mother's parlour;' and with which he made himself familiar before he was twelve years old. At the age of fifteen (not thirteen) he published a volume called 'Poetic Blossoms,' containing, among other things, 'The Tragical History of Pyramus and Thisbe,' written when he was ten years old. At college he increased his reputation by the elegance of his exercises: and not to mention minor works, composed the greater part of his 'Davideis,' an unfinished epic, in four books, on the troubles of David. Being attached to the court party, he was ejected in 1643, after he had taken his degree of M. A.; and he then settled in St. John's College, Oxford, where he became known and esteemed by some leading men, and being appointed secretary to lord Jermyn, afterwards earl of St. Alban's, was employed in the honourable and confidential office of cyphering and decyphering the correspondence of the king and queen. He followed the latter to Paris in 1646, and remained abroad ten years. Returning in 1656, as a sort of spy, 'to take occasion of giving notice of the posture of things in this nation,' he was seized, and obliged to give heavy security for his future behaviour. In the same year he published an edition of his poems, with a preface, in which he seems to have inserted something suppressed in subsequent editions, which was interpreted to denote some relaxation of his loyalty. He also obtained, Wood says, through the influence of the men then in power, the degree of M.D. at Oxford in 1657: having professed the study of physic, in order, it is said, to cloak the real motive of his visit to England. He does not appear ever to have practised, and the only fruit of his studies was a Latin poem upon Plants, in six books. Upon Cromwell's death he returned to France, and resumed his office. At the Restoration he expected to obtain the mastership of the Savoy, which had been promised to him both by Charles I. and II. In this, to his great mortification, he was disappointed; but some amends were made him by a beneficial lease of the queen's lands at Chertsey, in Surrey, whither he retired in 1665, and died in July, 1667, in his 49th year. He was buried near Chaucer and Spenser, in Westminster Abbey, where in 1675 the duke of Buckingham erected a monument to his memory.

Cowley is characterized by Dr. Johnson as 'the last and undoubtedly the best' of the metaphysical authors, a curious class, of whom the biographer, in his Life of Cowley, has given a critical account. 'In his own time he was considered of unrivalled excellence. Clarendon represents him as having taken a flight beyond all that went before him; and Milton is said to have declared that the three greatest English poets were Spenser, Shakspeare, and Cowley.' For a long time he was an object of supreme admiration, and his Pindaric Odes were imitated to weariness by those who could emulate his extravagance, but not his learning, wit, and fertility. This fashion has long been at an end: and while the simpler of our older poets have of late years been increasing in popularity, Cowley, we conceive, is scarcely known to a majority even of the poetical readers of this country. His merits are summed by Johnson in the following passage:—'He brought to his poetic labours a mind replete with learning, and his pages are embellished with all the ornaments which books could supply: he was the first who imparted to English numbers the enthusiasm of the greater ode and the gaiety of the less; he was qualified for sprightly sallies and for lofty flights; he was among those who freed translation from servility, and instead of following his author at a distance, walked by his side; and if he left versification yet inprovable, he left likewise from time to time such specimens of excellence as enabled succeeding poets to improve it.' His faults are, negligent and sometimes vulgar diction, rugged and prosaic versification, pedantry, hyperbolical exaggeration, and an abundance, unchecked by judgment, of that particular sort of wit which Johnson defines to be the discovery of occult resemblances in things apparently unlike. His poetry proceeds from the head more than the heart, and dazzles oftener than it touches. This applies especially to his amatory poems: 'Considered as the verses of a lover, no man that has ever loved will much recommend them. They are neither courtly nor pathetic, have neither gallantry nor

fondness.' And this is not wonderful, when we are told that he never loved but once, and then wanted resolution to tell his passion. His Miscellanies have gained high praise from the same critic, as containing 'great variety of style and sentiment, from burlesque levity to awful grandeur.' The style of his prose is also highly commended.

COWPARSLEY, a wild umbelliferous plant, called *Chærophylum temulum*.

COWPARSNEP, a wild umbelliferous plant, called *Hæradium Sphondylium*.

COWPER, WILLIAM, was born at Great Berkhamstead in Hertfordshire, of which place his father, the Rev. John Cowper, was rector, on the 15th of November (old style), 1731. He was first placed, when he was but six years old, at a school kept by Dr. Pitman, at Market Street in Hertfordshire. The cruelty of an elder boy rendered the two years which he spent here two years of misery. He was next placed in the house of an oculist, apprehensions being then entertained that he would lose his sight; and under the care of this oculist two more years of his boyhood were passed. At the age of ten he was sent to Westminster School, where he stayed till he was eighteen; applying during these eight years with diligence to his studies, and entering with spirit into boyish sports.

After leaving Westminster, Cowper was articled for three years to a solicitor; in whose office he had for a fellow-clerk the future Lord Thurlow. When the three years for which he was articled, during which however he gained no great stock of legal knowledge, expired, he took up his abode in chambers in the Middle Temple. In 1754 he was called to the bar; and in 1759 he was appointed a commissioner of bankrupts. One reason, and doubtless a principal reason, why the law had been fixed upon as Cowper's profession, was the existence of a certain amount of legal patronage in the hands of some of his relations. It was not certainly from any enthusiasm for the law evinced by Cowper; though it has not been made out that his profession had been determined upon by his friends in the teeth of convincing proof that he was unfit for it. Having however a small patrimony, and looking forward to the exercise in his favour of the family influence which has been mentioned, he cared not for that to which application would lead, any more than he liked the subject to which he was to apply; and accordingly he neglected the study of law. While residing in the Temple, he made love to his cousin, Theodora Cowper, the sister of his correspondent, Lady Hesketh, and dallied with literature. He was a member of a club called the 'Nonsense Club,' consisting entirely of Westminster men, among whom were Bonnell Thornton, Colman, and Lloyd; and he contributed a few papers to the 'Connoisseur,' of which Thornton and Colman were the joint projectors and writers.

His residence in the Temple extended through eleven years. In 1763, the last year of that residence, the offices of clerk of the journals, reading clerk, and clerk of the committees in the House of Lords, all which offices were at the disposal of a cousin of Cowper's, became vacant about the same time. The last two were conferred on Cowper. His patrimony was by this time well nigh spent, and the gift was therefore so far acceptable. But the duties attached to the offices of reading clerk and clerk of the committees were duties which required that he should frequently appear before the House of Lords; and to him, who suffered from extreme nervousness, a public exhibition of any kind was, as he himself expresses it, 'mortal poison.' He therefore, almost immediately after having accepted them, resigned these offices; and took that of clerk of the journals. But here again, his cousin's right of nomination having been questioned, Cowper was unexpectedly required to submit himself to an examination at the bar of the house, before being allowed to take the office. Thus the evil from which he seemed to have escaped again met him. 'A thunderbolt,' he writes in his memoir of himself, 'would have been as welcome to me as this intelligence.... To require my attendance at the bar of the House, that I might there publicly entitle myself to the office, was in effect to exclude me from it. In the mean time, the interest of my friend, the honour of his choice, my own reputation, and circumstances, all urged me forward; all pressed me to undertake that which I saw to be impracticable.' Unceasing was the anguish which he now suffered. He even looked forward anxiously to the coming of insanity, a constitutional tendency to which had manifested itself some years before,

that he might have a reason for throwing up the office; and when the dreaded day drew near, and he found himself still in possession of his senses, he determined on the commission of suicide. His many attempts to destroy himself all failed of success, owing, as he is pleased to explain it in his memoir, to direct interpositions of Providence. The office was ultimately resigned on the very day appointed for the examination; and shortly afterwards he became insane. He was immediately placed under the care of Dr. Cotton at St. Alban's, with whom he stayed until his recovery, which took place about eighteen months after, in June, 1765.

The form which Cowper's madness assumed was that of religious madness. A belief that he had been irrevocably cut off from a state of grace in this world, and of salvation in the next, was that which preyed upon his mind previous to the coming of the shock, and was predominant while it lasted. In the three subsequent periods of his life during which madness returned to him, from 1773 to 1776, for about six months in 1787, and during the six years preceding his death, its form was the same.

On Cowper's recovery in 1765, he took up his residence in Huntingdon, solely that he might be within reach of a younger brother who was then at Cambridge. Here he became acquainted with the family of Mr. Unwin, the beneficial influence exercised by whom on Cowper's subsequent life is well known. Finding that his spirits were sinking in the solitude in which he lived, and also that his scanty means were not sufficient to maintain a separate establishment, he became a boarder in Mr. Unwin's house. On Mr. Unwin's death in 1767, Cowper and Mrs. Unwin removed to Olney in Buckinghamshire, attracted thither by their esteem for Mr. Newton, who was then curate of the place. Mr. Newton, a man greatly to be respected for moral worth, was of that religious class which is commonly called evangelical; and Cowper now entered upon what is styled by a biographer belonging to the same class of pietists 'a course of decided Christian happiness, substituting frequent evangelical worship for the daily form of prayer with which he had hitherto contented himself, and enjoying the advantages of a more extended religious intercourse.' It is probable that Cowper, with his constitutional nervousness and predisposition to mental derangement, did not derive unmixed good from the excitement of frequent prayer-meetings and an unremitting attention to religious subjects. Mr. Newton had formed a plan of publishing a volume of hymns, and prevailed on Cowper to assist in composing them. They were afterwards published in 1776, under the title of Olney Hymns; but Cowper, before he had proceeded far in their composition, was visited with his second attack of madness, which lasted nearly four years.

In 1776, after Cowper's recovery, Mr. Newton removed from Olney. By Mrs. Unwin's advice he was now induced to commence a poem, taking, upon her suggestion, the Progress of Error for his subject; and he immediately went on to write three more moral satires, intitled 'Truth,' 'Table Talk,' and 'Expostulation.' These, together with the poems intitled 'Error,' 'Hope,' 'Charity,' 'Conversation,' and 'Retirement,' and some smaller pieces, were formed into a volume, which was published in 1782. He published a second volume in 1785, containing the 'Task' and 'Tirocinium,' the former of which poems had been commenced on the suggestion of another female friend, Lady Austen. It is to the same lady that we are indebted for the 'History of John Gilpin.' He had begun in 1784, so soon as the 'Task' and 'Tirocinium' had been written, his translation of Homer, which occupied him for the next six years. The translation was published in 1791. During its progress he had changed his place of residence from Olney to the neighbouring village of Weston, on the recommendation of his cousin, Lady Hesketh, with whom he had recently renewed a correspondence which had been long suspended, and whose attentions contributed much to the comfort of his later years. Almost immediately after the translation of Homer was completed, he undertook to superintend a new edition of Milton's Works, and to furnish translations of the Latin and Italian poems. In 1792 he paid a visit to Hayley at Eartham, in Sussex, not having made a journey for twenty years before. Symptoms of his constitutional malady had occasionally shown themselves during the eight or ten preceding years; and in the beginning of 1794 he was again afflicted with madness. A change of scene being judged desirable, he was removed

first to North Tuddenham in Norfolk, thence to Mundsey, and afterwards to East Dereham; and he succeeded in obtaining short intervals of comparative tranquillity, during which he composed one or two small pieces and revised his translation of Homer. Mrs. Unwin, his faithful companion, died on the 17th of December, 1796; and after three dreary years, Cowper followed her to the grave on the 25th of April, 1800. He died in his 69th year.

Cowper's merits have been summed up by Mr. Southey in the words—'the most popular poet of his generation, and the best of English letter-writers.' His letters are written in a genuine unaffected English style, and are marked for the most part by a playfulness and humour which effectually prevent the weary feeling that usually attends a long continuous reading of epistolary correspondence. Absence of affectation is again a chief characteristic of his poems. They are free from all sickly sentimentality or mannerism in language. As regards freedom from the first, the manliness of the poet presents a striking contrast to the feminine character of the man; while, with reference to the second point, Cowper has the merit of having done much towards that improvement in poetic diction which has since received a mighty impulse through the poems of Mr. Wordsworth. He was an enthusiastic lover of nature; and some of his descriptions of natural objects are such as Wordsworth himself might be proud to own. His poems contain also, as it is not too strongly expressed by Hazlitt, 'a number of pictures of domestic comfort and social refinement which can hardly be forgotten but with the language itself.' (*Lectures on the English Poets*, p. 182.) There is a striking amount of variety in his poems, or, taking but one of them, in the 'Task' alone. Some of his smaller pieces, as for instance the Lines on receiving his Mother's Portrait, and those addressed 'to Mary,' are exquisitely pathetic.

It is necessary to say a few words concerning his translation of Homer. Its execution is unequal, as might be expected in the case of a work of such length, and of an author subject to attacks of melancholy as Cowper was. But taken as a whole, and judged by those rules which should be applied to translations, it must be pronounced the best translation of Homer which we possess. He set out with a determination to seize, so far as he could, the real spirit of Homer; whereas Pope, who, it is well known, translated not from inclination, but for money, had thought of any thing else; and having adopted blank verse, he had to make no sacrifices of meaning or language to the tyranny of rhyme. From Cowper too, a man gifted with a decidedly poetical temperament, a more genial appreciation of Homer was to be expected than from one whose merits chiefly consist in powers of wit which are certainly great, and in a facility of rhyming which is certainly extraordinary. Cowper himself said of his predecessor—'There is hardly the thing in the world of which Pope was so destitute as a taste for Homer.'

There are numerous Lives of Cowper. It is unnecessary, since all that is peculiar in the views taken by preceding biographers is either embodied or discussed in these two, to mention more than those by Mr. Grimshawe and Mr. Southey. Each of these Lives is prefixed to a Collection of Cowper's Letters and Poems. Mr. Grimshawe announces that he presents a 'complete edition of the Works of Cowper, which it is not in the power of any individual besides himself to accomplish, because all others are debarred access to the "Private Correspondence." The 'Private Correspondence,' it appears, is a collection of Cowper's Letters, which was published in 1824 by Dr. J. Johnson, and the copyright of which is in the hands of Mr. Grimshawe's publishers. Though Mr. Southey is thus debarred from inserting the whole of this collection in his edition, he has embodied in the Life all that is material therein; while, by the kindness of many of the surviving relatives of Cowper's friends, he has obtained access to much of his correspondence that had never seen the light. He has also been enabled, through the same sources, to shed new light on many incidents of Cowper's life; for instance, his connexion with the ignorant enthusiast Teedon (vol. iii., chap. 16, 17.), and the breach with Lady Austen, which preceding biographers have invented many gossiping stories to explain, and which, by showing that Cowper gradually got tired of her society, he has divested of its former mysterious importance. A poem entitled 'Anti Thelyphthora,' being a satire against those who would do away with

the institution of marriage, appears among Cowper's poems for the first time in Mr. Southey's edition.

COW-POX. [VACCINA.]

COWRY SHELLS are called by conchologists *Cyprææ*. Their beauty has procured them a place among the ornaments of our chimney-pieces, and they have been in demand among civilized and uncivilized nations time out of memory. Like the precious metals, they are not only used for ornament, but they have also the qualities necessary to constitute them a species of currency. In fact, cowries are used as small coin in many parts of Southern Asia, as in India, the Burmese empire, Siam, &c., and especially on the coast of Guinea in Africa. Their great multiplication in these countries has however depressed their value much below that of the precious metals. In 1740 a rupee in Bengal was worth 2400 cowries; in 1766, 2560 cowries; and now, we believe, 3200 may be had for it.

The shells used as currency occur principally in the Philippine Islands, and on the coast of Congo, but particularly among the Maldivé Islands, of which they constitute the principal article of export. They are fished for three days after the high tides, by the women, with baskets, in which they take up a quantity of sand containing cowries. When the sand is washed out, the shells are heaped up on the shores, and the fish soon die; they are then ready for the market. (Sonnerat, Beckmann.) [CYPRÆIDÆ.]

COXE, WILLIAM, archdeacon of Wilts, was born in London, March, 1747. In 1768 he was a fellow of King's College, Cambridge. In 1771 he was appointed to the curacy of Denham, near Uxbridge, but soon after he went to travel on the continent as tutor to the marquis of Blandford, son of the duke of Marlborough, with whom he remained two years. In 1775 he accompanied in the same capacity lord Herbert, son of the earl of Pembroke, with whom he visited a considerable part of Europe. His 'Sketches of the Natural, Civil, and Political State of Switzerland, in a series of Letters to W. Melmoth,' 8vo. 1779, was translated into French with considerable additions by M. Ramond, a French traveller of taste and information, who rendered Coxe's work, which was rather dry and prosy, more attractive by adding many entertaining details. Coxe's attention had been chiefly directed to the political institutions of the numerous republics of the old Helvetic Confederation, a subject which had been already in some measure treated by Stanyan half a century before. Ramond travelled as a pedestrian through the most remote Alpine districts: he understood the dialects of the country, and in this respect had a great advantage over Coxe. He added to Coxe's work several entire letters, among others one in which he describes the striking scene, which few travellers have witnessed, of a general landsgemeinde, or assembly of the whole sovereign people of the canton of Glarus. Ramond's book is still one of the most interesting works upon old Switzerland, such as it was before the French invasion and subsequent changes. (*Lettres de Mr. W. Coxe sur l'Etat Politique, Civil, et Naturel, de la Suisse, augmentées des Observations faites dans le même Pays par le Traducteur*, 2 vols. 8vo., Paris, 1781.) In 1789 Coxe published a second edition, much enlarged, of his own work, under the title of 'Travels in Switzerland,' 3 vols. 8vo. The third volume is entirely engrossed by a description of the Grisons. Meantime in 1784, having visited the northern kingdoms of Europe, he published 'Travels into Poland, Russia, Sweden, and Denmark,' in 5 vols. 8vo., which were translated into French. Soon after the publication of this work he accompanied Mr. Samuel Whitbread on a tour on the continent, and in 1786 he went there again with the son of Mr. Portman, of Bryanston, Dorset. In 1788 he was presented to the rectory of Bemerton by the earl of Pembroke. In 1794 he again visited the continent with lord Brome, eldest son of the marquis Cornwallis; and on his return was made chaplain of the Tower.

Coxe had collected a considerable store of information during his travels, of which he availed himself in writing several historical works, the most important of which is the 'History of the House of Austria from the foundation of the Monarchy by Rudolf of Habsburg to the death of Leopold II. in 1792,' 3 vols. 4to., London, 1807. It is a work of considerable labour and research, and conscientiously written. The author quotes in his preface and in the body of the work, his authorities both printed and MS;

he also availed himself of oral information which he collected in his travels. 'I have endeavoured,' he says in his preface, 'to divest myself of party and local prejudices; I have weighed every evidence with candour and impartiality, and have given the result of a laborious investigation by presenting a faithful and consistent picture of times, characters, and events, without trespassing on the patience of the reader by disquisitions on the innumerable contradictions and clashing testimonies which impeded my progress at every step.'

The author has confined himself to the German branch of the house of Austria, leaving out the Spanish branch from Philip II. The work was translated into German, and seems to have been well received at Vienna. Coxe also wrote—1. 'History of the Kings of Spain of the House of Bourbon, from 1700 to 1788,' 3 vols. 4to., 1813. 2. 'Memoirs of John Duke of Marlborough, with his Original Correspondence,' 3 vols. 4to., 1817—19; an elaborate and valuable work. 3. 'Memoirs of Sir Robert Walpole, Earl of Orford, illustrated with Original Correspondence and Authentic Papers,' 3 vols. 4to., 1798. 4. 'Account of the Russian Discoveries between Asia and America; to which are added, the Conquest of Siberia, and the History of the Transactions and Commerce between Russia and China,' in 4to. Gmelin, Pallas, Müller, and others had already treated these subjects, but Coxe has added more complete information which he collected at Petersburg. 5. 'Private and Original Correspondence of Charles Talbot, Duke of Shrewsbury, with King William III., the Leaders of the Whig Party, and Others.' 6. 'An Historical Tour in Monmouthshire, illustrated with plates from the drawings of Sir R. C. Hoare,' 2 vols. 4to. 7. 'An Account of the Prisons and Hospitals in Russia, Sweden, and Denmark, with Remarks on the Different Modes of Punishment in those Countries,' 8vo. 8. 'Literary Life and Select Works of Benjamin Stillingfleet,' 3 vols. 8vo.; besides several minor works.

In 1803 he married Eleanora, daughter of Walter Shairp, consul-general of Russia. In 1805 he was appointed arch-deacon of Wilts. After publishing the 'Memoirs of Marlborough,' in 1819 his sight failed him, and he became gradually blind. He died at Bemerton at an advanced age, in June, 1828. Coxe occupies a respectable place among modern historians: the subjects that he has treated are numerous and important; and he spared no pains to collect the best information, for obtaining which he had facilities of access to some important private collections. The following work was published after his death: 'Memoirs of the Administration of the Right Honourable Henry Pelham, collected from the Family Papers,' 2 vols. 4to., London, 1829.

COYPEL, the name of a family of painters. Noel, the first of the family who attained any reputation, was the son of Guyon Coypel, a younger son of a Norman family, and was born in 1628. Guyon practised painting, but apparently with little success. He placed his son at an early age with Vouet, a painter at Orleans, and afterwards under a painter named Quillerier. Noel rose rapidly in reputation, and was received into the Academy at Paris in 1663. He was appointed by the king director of the Academy at Rome, where he resided some time, enjoying the acquaintance of Bernini, Carlo Maratti, and other eminent painters of the day. Noel Coypel was a diligent student, and the French Academy in Rome profited greatly by his assiduous example. Having returned to Paris, he was successively made rector and director of the Academy. He died in 1707, working at his art to the last. Noel was married twice, and left two sons, Antoine and Noel Nicholas, and many daughters. Antoine, his father's pupil, was born in 1661, and accompanied his father to Rome, where he studied the works of the old masters. He afterwards travelled for improvement into Lombardy. He left Rome at too early an age to profit as he might have done by his studies from the Italians, being then no more than eighteen years of age. He made such progress in his profession, that at the age of twenty he was received into the Academy. In 1707 he was made professor and rector, and in 1714 director. He was married, and at his death in 1722 left one son, Charles, also a painter, and his father's pupil, who successively passed all the ranks to the highest in the Academy. Noel Nicholas, the second son and pupil of Noel, was born in 1692. He was received into the Academy in 1720, during his brother's rectorate. He did not attract much notice until after his

brother's death, but then rose rapidly in reputation till the time of his own death, in 1673.

Noel Coypel is skilful and spirited in design, and a lively colourist, but somewhat affected. Antoine, the most famous of the family, has much power and variety in his design; but the mannered style of the French school was not corrected by his study of the Italian, since he was too ready to adopt the artificial graces of Bernini, his friend and adviser. Noel Nicholas, although not free from the factitious elegance of his relatives, possesses a considerable feeling for pastoral enjoyment, which is evinced in some rustic compositions. The principal works of all the Coypels are at Paris. (Argenville.)

COYPOU, or COYPU, Molina's name for a rodent quadruped, the *Quoiya* of D'Azara, the *Couï*, *Mus Coypus* of Molina and Gmelin, *Hydromys Coypus* of Geoffroy, *Myopotamus Bonariensis* of Commerson. Lesson alters the name to *Potamys*, but *Myopotamus* is the term usually current among zoologists.

Generic Character.—Head large; muzzle obtuse; ears small and round. Feet five-toed; thumb of the fore-feet very short, the four fingers free; posterior feet palmated. Tail long, conical, strong, scaly, and sprinkled with scattered hairs.

Dental formula. Incisors, $\frac{2}{2}$. Molars, $\frac{4-4}{4-4}=20$. The molars gradually increase in size from the first to the last, and approximate to those of the beavers.

[Teeth of Coypu, rather less than natural size, from F. Cuvier.]

Mr. Martin, in the 'Proceedings of the Zoological Society' (1835), has given an interesting account of the anatomy of an individual that lived and died in the gardens of the Society. The skull, although it agreed in many points with that of *Capromys*, approximated nearest to that of the *Capybara*. 'The main outline and contour of both are very similar; they both agree in the flatness of their upper surface, in the elongation of their form, in the magnitude of the suborbital foramen, and in the development of the processes of the occipital bone, continued from its transverse crest. When, however, we descend to details, numerous and striking points of difference are immediately observable. In the *Capybara*, for instance, the margin of the orbit is circular or nearly so, and the zygomatic arch, broad and strong, has its lower edge brought down considerably below the level of the molars, though it advances much farther than either in the *beaver* or *water-rat*; in which animals the orbits, of an oval shape, have a less lateral and more vertical aspect. In the *Coypus* the temporal fossæ are deeper than in the *Capybara* or the *beaver*, and the external auditory foramen runs obliquely forwards and downwards, while in the *Capybara* it runs obliquely downwards and inwards, and in the *beaver* downwards and backwards. The frontal bone is divided by a permanent longitudinal suture, as it is also in *Capromys*; whereas in the *Capybara*, the *water-rat*, and the *beaver*, no trace, at least in adults, of such a separation is visible. The *beaver*, when semi-adult, exhibits, however, a slight appearance of it.' The number of the vertebræ, according to the same author, is as follows:—Cervical, 7; dorsal, 13; lumbar, 6; sacral, 4; caudal, 23. The ribs are short, thin, and flexible,

and the capacity of the chest is small. The dentition, he observes, differs widely from that of *Hydromys*, with which the animal was associated generically by M. Geoffroy St. Hilaire. Baron Cuvier, he remarks, states that the skull of the *Coypus* has a resemblance to that of *Hystrix dorsata*, but he adds that he has not seen the skull of that animal, and therefore cannot judge; though certainly the teeth, as given by M. F. Cuvier, and those of the *Coypus* differ materially. 'The *incisores* are large and strong, and of a deep orange yellow on their outer surface; the alveoli of those of the upper jaw pass through the intermaxillary into the true maxillary bones. In the lower jaw they extend beneath the whole of the molares.' The *scapula*, it appears, agrees closely with that of *Capromys*, but differs considerably in shape from that of the *beaver*. Its anterior edge runs out into an angle, at a greater comparative distance from the spinous ridge than either in the *beaver* or the *porcupine*, and the same may be said of the posterior angle; so that the total breadth of this bone is comparatively greater than it is in those two animals. The *clavicle* is slender. The *humerus* presented nothing extraordinary. The *pelvis* was long and narrow. The *femur* was thin and small, and had both a *trochanter major* and a *trochanter minor*.

But the following would seem to be the most remarkable part of the osseous structure of the Coypou.

'In the motions of the hinder limbs of the *Coypus* when alive,' says Mr. Martin, 'I observed not only an awkwardness but a want of firmness, which gave something of a crawling character to the progression of the animal on the floor. A recollection of this circumstance, which struck me when I first saw the animal, led me to open the capsule of the hip-joint with care: on doing this, I was surprised to see no *ligamentum teres*; on opening the other, still none appeared. I am convinced that I did not destroy or rupture the ligament, for no ruptured fibres were at all visible; and on opening the *acetabula* of other animals at the same time, the ligament was found strong and large; in this, however, nothing of the kind was visible. There is on the head of the *femur* a very slight depression, but it is covered, as the rest of the head, with smooth cartilage. I believe therefore that the *Coypus* may be added to the list of the few *Mammalia* in which this ligament is absent; but it would be desirable that another specimen should be examined before this peculiarity is insisted on as an ascertained fact.'

Mr. Martin was unable to examine all the bones of the extremities, which he regrets, as Cuvier notices a peculiarity in those of the *carpus*; viz., in there being no separation between the *os magnum* and *trapezoides*.

Of the viscera, the spleen presented the same figure as in the *Ondatra*, the *Capromys*, and some other rodents. The stomach closely resembled that of *Capromys*. The *duodenum* commenced with a large *sacculus* projecting towards the *oesophagus* like a *cæcum*, in which respect it resembles *cælogenus* as described by Sir E. Home. A similar dilatation, Mr. Martin remarks, has been noticed in *Capromys*, *Anæma*, and *Dasyprocta*, but not so considerable. There were several other resemblances to *Capromys*, in the intestines, in some of the abdominal muscles, and in the urethra; but we must refer the reader for the details to the paper itself, which is of considerable length, and well worth perusal.

Description.—Less than the beaver, which however it resembles in many points. *Head* large and depressed; ears small and rounded; muzzle sharper than that of the beaver, with very long and stiff whiskers. *Neck* stout and short. *Limbs* short; fore-feet not webbed, fingers on each five, the thumb very small; hind-feet with the same number of toes, the great-toe and three next joined by a web which extends to their ends, little-toe free, edged with a membrane on the inner side; nails compressed, long, crooked, and sharp. *Tail* round and thinly hairy, the hairs permitting the scaly texture of the skin to be seen. *Back* brownish-red, becoming redder on the flanks. *Belly* of a dirty red. Edges of the *lips* and extremity of the *muzzle* whitish.

Geographical Distribution.—South America. Very common in Chile, Buenos Ayres, and Tucuman: more rare in Paraguay.

Habits, much resembling those of the generality of aquatic rodents. It swims with great ease, affects the neighbourhood of water, and burrows in the ground. Its principal food in a state of nature is vegetable. The female brings forth from five to seven, and the young always accompany her till they are well grown.

The French authors say that the coypou is easily domesticated, and that its manners in captivity are very mild. The individual kept in the garden of the Zoological Society in the Regent's Park did not show much sociability of disposition, but it was confined in a cage of no large dimensions, and there was not much opportunity for making it familiar.

[Myopotamus Coypus.]

Utility to man.—The coypou, like the beaver, has two kinds of fur. The long ruddy hair gives the tone of colour, and the brownish ash-coloured fur at its base is, like the down or wool of the beaver, the cause of the animal's commercial value, and used largely in the manufacture of hats. In France the skins were, and perhaps still are, sold under the name of *Racoonda*. M. Geoffroy mentions that, in certain years, a single French furrier, M. Bechem, has received from 15,000 to 20,000 skins. They are imported into Great Britain to a large amount—from 600,000 to 800,000 have been stated as the importation of one year, principally from the Rio de la Plata—under the name of *Neutria* or *Nutria* skins, an appellation probably derived from some supposed similarity in the appearance and habits of the animal which produces it to the otter, the Spanish name of which is *Nutria*.

CRAB (Zoology), *Cancer*, Leach; *Platycarcinus*, Latreille, Edwards. Dr. Leach restricted the genus *Cancer* to the form of *Cancer pagurus*, Linn., the large eatable crab of our coasts, which was, when he defined the genus, the only species known.

Generic character. External antennæ with the basilar joint broad, very long and thick, filling the hiatus between the inner *canthus* of the orbit and the front, and terminating forwards in a strong, angular, tooth-like projection, directed forwards and a little inwards, reaching beyond the frontal line. The terminal or moveable portion is slender, very short, and arises from the internal part of the basilar joint, nearer to the cell of the internal antennæ than to the orbit. The internal antennæ, instead of lying obliquely outwards or transversely, as in most other genera of this section, are directed forwards; a character by which *Cancer* may at once be distinguished from *Platypodia*, *Carpilius*, *Xantho*, &c. The second joint of the inner footstalk of the external pedipalps is excavated at the anterior part of the inner margin; in some species the notch is confined to the angle, in others it extends half way down the side of the joint. The first pair of feet is nearly equal; in some specimens of each species, the difference in size being scarcely appreciable. They are, generally, very robust. The remaining feet have no spines, but are in most species more or less hairy. The abdomen of the male has five, that of the female seven joints. (T. Bell.)

Geographical Distribution. With the exception of our indigenous species, *Cancer pagurus*, they are all, as far as their localities are known, exclusively natives of the coasts of the hotter parts of America. (T. Bell.)

Mr. Bell in his interesting paper on the genus *Cancer*, (Zool. Trans. i. 335.) gives three new species, viz. *Cancer longipes*, *Cancer Edwardsii* and *Cancer dentatus* brought

home by Mr. Cuming and Mr. Miller, besides *Cancer irroratus* of Say, and *Cancer pagurus*, which last, as it was considered the type by Dr. Leach, we select as an example.

Carapace transversely oblong, flattened, but little higher in the middle than at the sides, somewhat rounded before and behind; the surface minutely granulated, smooth, with the regions but slightly marked. Latero-anterior margin slightly recurved, divided into ten quadrate lobes, the sides of which are contiguous, and the margins entire; the last lobe inconspicuous, and passing into the posterior marginal line, which terminates immediately anterior to the posterior transverse ridge. Front trifold, the teeth of nearly equal length and size. Orbits round, with a strong triangular tooth over the inner *canthus*, which does not project so far as the front; and a smaller one filling the space between the two superior fissures. External *antennæ* with the basilar joint much elongated, and terminating forwards in an obtuse tooth; the first joint of the moveable portion club-shaped, the second cylindrical, the remaining portion setaceous. Internal *antennæ* directed forwards, the anterior half doubled directly backwards in a state of rest. The basilar joint broad, cup-shaped, its outer edge projecting forwards; the second joint (the first of the moveable portion) cylindrical, the penultimate with a small, hooked, and recurved process at the *apex*. Pedipalps as in the rest of the genus. *Sternum* minutely punctated, and furnished with small patches or lines of short scanty hair. *Abdomen* in the male with the margin fringed with short hair; the last joint forming an equilateral triangle. Anterior feet, large, robust, smooth, without spines or tubercles, minutely granulated, the hand rounded, without crest, the inner surface exhibiting only the rudiments of the five lines of *puncta*, so conspicuous in other species of the genus. The remaining feet furnished with numerous *fasciculi* of stiff hairs, the last joint in all furrowed, and terminated by a short strong nail. Colour above, reddish brown, the legs more red, the claws deep shining black; beneath whitish. *Locality*. Coasts of Great Britain, &c. and of western Europe. (T. Bell.)

Pennant states that this species inhabits rocky coasts, and is the most delicious meat of any, and that it casts its shell between Christmas and Easter. 'There are some species,' says Mr. H. Milne Edwards, in his article *Crustacea* (Cyclopædia of Anatomy and Physiology) 'such as the crabs and the Brachyura generally, in which the carapace presents a considerable expansion on either side, forming two large compartments, in which the greater mass of the thoracic viscera is contained. Under these circumstances, it would be impossible for the animal to escape from its dorsal covering by the relatively inconsiderable opening which this part presents on its inferior aspect. This renders it necessary that the carapace, instead of being cast off by simply rising in a single piece, should give way and separate in some direction or another, and this it does by splitting along the curved lines, extending on either side from the mouth to the origin of the abdomen, in the course of which the epimeral pieces cohere with the dorsal one.' (Collinson, Phil. Trans. 1746 and 1751; Hist. Nat. des Crustacés, t. 1. p. 56.) Mr. Lyell says (Principles of Geology, vol. 3.) 'A large female crab (*Cancer Pagurus*) covered with oysters, and bearing also *Anomia Ehippium* and *Actinæ*, was taken in April 1832, off the English coast. The oysters include individuals of six years' growth, and the two largest are four inches long and three inches and a half broad. Both the crab and the oysters were seen alive by Mr. Robert Brown. This specimen is in the collection of my friend Mr. Broderip, who observes that this crab, which was apparently in perfect health, could not have cast her shell for six years, whereas some naturalists have stated that the species moults annually, without limiting the moulting period to the early stages of growth of the animal.'

The term *Crab* is in common parlance applied to the great bulk of the Brachyurous crustaceans. The different genera will be found under their appropriate titles, CO-RYSTES, HERMIT-CRAB, GECARCINUS (Land-crab), &c. &c. for example.

For the blood-spotted crab of the Asiatic seas, *Cancer maculatus*, Linn. &c. and the coralline crab, *Cancer corallinus*, Fabr. Dr. Leach instituted the genus *Carpilius*, characterized by the existence of a single tooth on the border of the carapace, and by the tridentated front; and, for the eleven-toothed crab, *Cancer undecimdentatus*, Fabr. the carapace

of which is smooth, with eleven crenelated teeth on each antero-lateral border, and black toothed fingers, spoon-shaped at the end, he founded the genus *Clorodius* or *Chlorodius*. Mr. Milne Edwards enumerates four species of *Carpilius* and seven of *Chlorodius*. He considers the fossil *Crabe aux grosses pinces*, *Cancer macrochelus*, Desm. (Hist. Nat. des Crustacés Fossiles, p. 91. pl. vii. fig. 1—2), *Cancer Lapidescens*, Rumph. (Amb. Rariteit Kamer, pl. 60. f. 3.) as referable to the genus *Carpilius* rather than to the division of crabs properly so called. It should be remembered that Mr. Milne Edwards's genus *Cancer* (*crabe*) differs from that of Dr. Leach. The former includes under that name such forms as *Cancer roseus* (*Carpilius roseus* of Rüppell) *Cancer lobatus*, *Cancer esculptus*, *Cancer limbatus* (*Xantho granulatus*, Rüp.) *Cancer Savignii* and *Cancer Acanthus*, excluding Dr. Leach's *Cancer*, the type of which is the eatable crab of our coasts, to which form Mr. Milne Edwards gives the name *Platycarcinus*. For the reasons assigned by Mr. T. Bell, we retain Dr. Leach's arrangement. It does not appear that any species of *Cancer*, Leach, *Platycarcinus*, Milne Edwards, has been found in a fossil state.

CRABBE, GEORGE, was born at Aldborough, in Suffolk, on the 24th of December, 1754. His parents were in an humble condition of life, the father being a warehouse-keeper, and collector of the salt-duties, or saltmaster, at Aldborough. The future poet showed, at a very early age, a taste for reading, and a delight in aught that bore the shape of poetry; and his father was thus led to give him an education better than he could well afford. It was determined that he should follow the profession of a surgeon; and having made some progress in mathematics at school, and also, as his son expresses it, 'laid the foundations of a fair classical education,' he was in his fourteenth year apprenticed to a surgeon at Wickham Brook near Bury St. Edmunds. He stayed with this surgeon three years, and, not having been well treated, was, in 1771, transferred to another at Woodbridge in Suffolk, with whom he finished his apprenticeship. His father had been in the habit of taking in a periodical, called Martin's Philosophical Magazine, the last sheet of which was always devoted to 'occasional poetry;' and when, at the end of the year, he sent the magazines to be bound, these sheets of poetry were contumeliously cut out, and became the property of George. He read them over and over again, and when yet very young tried to write pieces of poetry himself. Neither school nor surgery deprived him of the taste formed thus early. While at Wickham Brook he filled a drawer with verses, and at Woodbridge, having written a poem on Hope for a prize offered in Wheble's Lady's Magazine, and having been successful, he was induced to go on contributing to the publication in which he had gained his first laurels, and before his return home published in a separate form, but anonymously, a poem entitled 'Inebriety.'

He returned home at the close of 1775, and had now for a time to submit to the drudgery of the warehouse, until his father could afford to send him to London in order to complete his medical education. When at last he went, it was with means too scanty to allow of his gaining any real advantage; and he returned before a year had expired, but not till his resources, though carefully husbanded, had been exhausted. Shortly after, he was encouraged by his friends to set up as a surgeon and apothecary. He had never, it appears, liked his profession, though, impelled by a sense of duty, he had made more than one effort to apply himself to it with diligence. His preparation for the duties which he was now liable to be called upon to perform had been inadequate; and added therefore to dislike of those duties was uneasiness under the responsibility which attached to him. He was in love, and the object of his attachment was (we quote his son's words) 'too prudent to marry, where there seemed to be no chance of a competent livelihood; and he, instead of being in a position to maintain a family, could hardly, by labour which he abhorred, earn daily bread for himself. He was proud too; and, though conscious that he had not deserved success in his profession, he was also conscious of possessing no ordinary abilities, and brooded with deep mortification on his failure.' After a short struggle with himself, he resolved to abandon his profession, and proceed to London as a literary adventurer. Being without money, he wrote to Mr. Dudley North, whose brother, Mr. Charles Long, had been a candidate for Aldborough, requesting the loan of

five pounds. 'A very extraordinary letter it was,' said Mr. North some years afterwards to Crabbe, when they met on terms of equality; 'I did not hesitate for a moment.' Thus provided with money he embarked on board a sloop at Aldborough, and, working his way, arrived in London in April, 1780.

He took lodgings near the Exchange, and set about authorship with vigour. He projected the publication of a prose work, entitled 'A Plan for the Examination of our Moral and Religious Opinions;' but thought it expedient, before publishing this, to make himself known by a poem. Two poems, prepared with this view, were rejected by the booksellers to whom they were offered. He now published, on his own account, a poem entitled 'The Candidate;' but, almost immediately after it appeared, the publisher failed, and all hopes of profit from this attempt were thus taken away. His stock of money meanwhile had gradually disappeared, and he was reduced to great distress. He had been advised at Aldborough to apply for assistance to Lord North; he did so, and received none. He then applied to Lord Shelburne and Lord Thurlow, enclosing some of his poems to both; but these applications were equally unsuccessful with the former. At last, and not till after he had been threatened with arrest, he bethought himself of Burke. The letter which he addressed to Burke is a beautiful piece of writing, simple, dignified, and pathetic. 'The night after I delivered my letter at his door,' he told Mr. Lockhart some years after, 'I was in such a state of agitation, that I walked Westminster bridge backwards and forwards until day-light.' Burke immediately appointed a time at which he would see Crabbe; he received him with great kindness, and encouraged him to show him all his compositions. Having selected 'The Library' and 'The Village,' and having suggested in them many alterations which Crabbe assented to, he took these poems himself to Mr. Dodsley. 'The Library' was in consequence published in 1781. But Burke's attention did not stop here. He assisted him with money, and gave him a room at Beaconsfield, where he was treated in every way as one of the family; he introduced him to Fox, Sir Joshua Reynolds, Lord Thurlow, and other distinguished friends; and having advised Crabbe to think of entering the church, towards which he found him by no means disinclined, he exerted all his influence to get him ordained. His conduct towards Crabbe is indeed a brilliant chapter in the history of Burke.

Crabbe was admitted to deacon's orders in December, 1781, by Dr. Yonge, bishop of Norwich, and was ordained a priest in August of the year following. He commenced his clerical life as curate of his native town. Shortly after he obtained, through Burke's influence, the situation of domestic chaplain to the duke of Rutland, and resided in consequence at Belvoir Castle. 'The Village' appeared in 1783, having been revised by Dr. Johnson: its success was great, and Crabbe's reputation was now fully established. In the same year Lord Thurlow, who had taken a previous opportunity of apologizing for his first repulse of Crabbe, presented him with two small livings in Dorsetshire, telling him, as he gave them, that, 'by God, he was as like Parson Adams as twelve to the dozen.' Crabbe now married Miss Sarah Elmy, the object of his first love. The duke of Rutland had been, in the meantime, appointed lord-lieutenant of Ireland. Crabbe did not accompany him to Ireland, but apartments in Belvoir Castle were assigned to the young married couple. In 1785 Crabbe took the neighbouring curacy of Strathern, and removed from the castle to the parsonage of that parish.

It appears, that though Crabbe was treated most kindly by every member of the Rutland family, and felt for them in return great affection and esteem, especially for the duke, a man of amiable character and literary tastes, he found his situation at Belvoir Castle an irksome one. He liked not to 'eat the bread of dependence;' and cared not 'to bask in the sunshine of a great man's smile.'

Crabbe published 'The Newspaper' in 1785. He did not come forward again as an author until 1807, when, after an interval of twenty-two years, appeared 'The Parish Register.' He resided in the meanwhile successively at Strathern, at Muston in Leicestershire (Lord Thurlow having in 1789, at the duchess of Rutland's earnest request, exchanged his two small livings in Dorsetshire for those of Muston and Allington, both situated in the Vale of Belvoir); from 1792 to 1796 at Parham in Suffolk, taking charge of the neighbouring curacies of Sweffling and Great Glemham; then in

Great Glemham Hall, a house belonging to Mr. Dudley North, his early benefactor; until at last, in 1805, he returned to his rectory at Muston. Though during this long period Crabbe published no poetry, he was not idle. He studied botany, which had always been a favourite pursuit, with great ardour; and wrote an essay on botany in English, which he was on the point of publishing when, yielding to the remonstrances of a vice-master of Trinity College, Cambridge, against degrading the science by treating it in a modern tongue, he consigned his manuscript to the flames. He also pursued entomology and geology. He taught himself French and Italian, and superintended the education of his sons. He was also, according to his son's account, continually writing; and among his compositions during this period were three novels, which, upon his wife's suggesting that the tales would have been better in verse, he consigned to the same fate with the essay on botany.

Together with 'The Parish Register' there appeared, in 1807, 'Sir Eustace Grey' and other smaller pieces, and a reprint of his earlier poems; the object of the publication being to enable him to send his second son to Cambridge. Three years after, he published 'The Borough.' In 1813 he sustained a heavy affliction in the loss of his wife; and it was a fortunate circumstance, at a time when every scene at Muston would excite a painful remembrance, that the duke of Rutland, the son of his former patron, gave him the living of Trowbridge in Wiltshire. The incumbency of Croxton near Belvoir was added shortly after.

The remainder of Crabbe's days were, with the exception of occasional visits to his friends in London and elsewhere, passed at Trowbridge, where his conscientious discharge of his duties and his amiable character gained for him the love of all his parishioners. When in London he was much courted by those among the great who are studious to derive distinction from the patronage of literary men: and, what is more to the point, he now made the acquaintance of most of those who, during his retirement, had earned for themselves fame in his own vocation—Rogers, Moore, Campbell, Wordsworth, Southey, and Sir Walter Scott. His 'Tales of the Hall' were published in 1819 by Mr. Murray, who gave him 3000*l.* for them and the remaining copyright of his previous poems. In the autumn of 1822 he visited Sir Walter Scott at Edinburgh. From 1828 there was a perceptible change in his health, and though his mind retained its wonted cheerfulness, his strength of body gradually declined. He died on the 3rd of February, 1832, in his 78th year. The shops in Trowbridge were closed as soon as his death was known, and again on the day of his funeral; and a subscription was immediately set on foot among his parishioners for a monument to their departed rector, which has since been placed in Trowbridge church.

The moral character of Crabbe is an almost perfect model. Its greatest fault was an excess of gentleness. Thus, though he was not deficient in what is called moral courage, and though he heeded not rank or power or even physical force, when any of these threatened him in the performance of what he deemed his duty, he sometimes, in the common intercourse of the world, cowered at the roughness of ruder natures. Rising from a very low situation in life, he came to associate much with those whom the world sets up for worship; but, under circumstances whose corrupting influence few have withstood, he never lost that habit of self-dependence without which there is neither dignity nor happiness. If it be said that his many applications in early life to the great by rank and office indicated a disposition to place trust in nobles, it can be answered that accident first led him to Lord North, and that he persisted in his applications to him and others similarly situated, because he thought the encouragement of literature to be one great duty of those who fill the first offices of state. Joined with an indifference to factitious distinctions, was an absence of all pride occasioned by his own intellectual eminence. He was meek, observant of merit in others, and eager to impart to those who were, as he had been, distressed, a share of the advantages which his own good fortune had procured for him. As a husband, father, and friend, he was without reproach. His son's account of the manner in which his days were passed at the parsonage presents a delightful picture of domestic happiness.

The distinguishing excellences of Crabbe's poetry are simplicity, pathos, force, and truth in describing character. He has said himself that all his characters were taken from persons whom he had seen and known. Ob-

serving these closely, and specifying each *trait* and minute circumstance, he presents his readers with representations, not of classes of men, but of individuals. It is the minute accuracy of these representations that constitutes their charm. Who can forget Isaac Ashford? The celebrated descriptions of the parish workhouse, and of the 'disputatious crew' of thieves and smugglers in 'The Parish Register,' show the same faculty of minute observation, and have the same charm of faithful delineation. There are also in his poems some good descriptions of natural scenery, for instance, at the commencement of 'The Village;' but then it is only scenery of the sort for which what Mr. Jeffrey called his 'Chinese accuracy' is fitted. Crabbe was entirely without the power of invention. Viewing him, moreover, not merely as a poet whose business it is to please, but as one possessing powers above the common herd, which it is his duty to employ for the improvement of his fellow men and the increase of social happiness, we object to him that he has not gone beyond the representation of existing evil,—that he has revelled as in a luxury in descriptions of vice and woe, and has never cared to teach how the poor, of whom he is emphatically called the poet, may be made wiser and better and happier.

An edition of Crabbe's poems in eight volumes was published by Murray in 1834. The eighth volume consists of a collection of tales in verse, then published for the first time, which will not add much to the author's reputation. The Life by his son, the Rev. George Crabbe, a very pleasing piece of filial biography, occupies the first volume.

CRABRO'NIDÆ (Leach), *Crabronites* (Latreille), a family of Hymenopterous insects of the section *Aculeata* and subsection *Fossores*. Technical characters:—Head large, and appearing almost square when viewed from above; body oval or elliptical, narrowed more or less at the base, and joined to the thorax by a peduncle; antennæ short and generally thickened towards the apex.

According to Latreille, the following genera are included in this family:—*Tripoxylon*, *Gorytes*, *Crabro*, *Stigmaus*, *Pemphredon*, *Mellinus*, *Alyson*, *Psen*, *Philanthus*, and *Cerceris*.

The species of the genus *Crabro* are chiefly distinguished by their having but one perfect cubital cell to the anterior wing; the mandibles terminating in a bifid point, and the antennæ being distinctly geniculated, they are sometimes filiform, and sometimes slightly serrated. The palpi are short, and almost equal. The clypeus is frequently clothed with a fine down of a glossy silver-like hue.

These insects are extremely active in their movements, and may be frequently seen settling on the flowers of umbelliferous plants, on palings, or on the leaves of plants, when the sun is shining upon them, lying wait in such situations, for the approach of other insects, which they seize and carry to their nests for the purpose of feeding their larvæ. The larger species of this country are mostly of yellow and black colours, the body being adorned with rings of the former colour, the smaller species are for the most part black.

Crabro cephalotes, is upwards of half an inch in length; black; the body is adorned with five yellow rings; the basal joint of the antennæ, and the tibiæ and tarsi are also yellow.

Crabro patellatus (Panzer), and several other species of this genus, are remarkable in having a large appendage attached to the external part of the anterior tibiæ; this is a thin plate of a somewhat rounded form, convex above and concave beneath, and is undoubtedly used in removing the soil whilst these insects are forming their burrows in the ground. Each burrow is stored with flies or other insects (depending upon the species of crabro to which it belongs); the eggs are then deposited with these flies, which constitute the food of the larvæ when hatched. Many species of *Crabro* form their cells in rotten trees or posts. Much that relates to the habits of these insects, however, remains to be discovered.

CRABTREE, WILLIAM. [See HORROX, JEREMIAH], as very nearly all that is known of Crabtree arises from the correspondence of the two.

CRA'CIDÆ, Mr. Vigors's name for a family of raso-rial or gallinaceous birds (*Rasores*), which he considers to be connected with the Struthious birds, *Struthionidæ* (Ostrich family), by means of the *Dodo*, generally supposed to be now extinct, the foot of which, he observes, has a strong hind toe, and which, with the exception of its being more robust, in which character it still adheres

to the *Struthionidæ*, corresponds exactly with the Linnean genus *Crax*. The bird, says Mr. Vigors, thus becomes osculant, and forms a strong point of junction between these two conterminous groups, which, though evidently approaching each other in general points of similitude, would not exhibit that intimate bond of connexion which we have seen to prevail almost uniformly throughout the neighbouring subdivisions of nature, were it not for the intervention of this important genus.

'The family of *Cracidæ*,' continues Mr. Vigors, 'thus connected with the *Struthionidæ*, are separated from the typical groups of the order by the length and robustness of the hinder toe, and by its being situated more nearly on a level with those in front. These birds placed in this manner at the extreme of the present order, assume more of the habits and appearance of the preceding order of *Perchers* than the other *Rasores*, with the exception of the family of *Columbidæ*. They are found most frequently to make their abode in trees, and to resort to the neighbourhood of forests in the lesser number of their tail-feathers they evince an equal deviation from their more typical congeners, and they never possess a spur. This family contains the *Ourax* of M. Cuvier, and the true *Crax*, Linn, together with the *Penelope* and *Ortalida* of M. Merrem. The two latter genera have their hind toe articulated on a level with the front toes, and thus reconduct us to the *Columbidæ*. Their bills also, more lengthened than those of *Crax*, approach most nearly to those of the *Pigeons*, which, on the other hand, seem to meet them by the stronger form and curvature of the bill of *Vinago*, which deviates in these particulars from the general structure of its own family. The genus *Ortalida*, in particular, the feathered cheeks of which are distinguished from the naked face of *Penelope*, brings us in immediate contact with that family. Here it is, in this extreme of the order, that I would assign a place to the beautiful New Holland genus *Menura*, Lath., a group that has hitherto afforded more difficulty to the systematic writer than any other in the class. By modern authors it is generally placed among the *Perchers* on account of the length and low position of the hind toe. But its habits and manners are gallinaceous, as far as we can ascertain, and its general appearance decidedly evinces an affinity to the *Rasores*. The deviation in the structure of the foot from that of the typical *Rasorial* groups only indicates its being placed at a distance from them, and in that extreme of the order which connects itself with the conterminous order of *Perchers*. The same deviation, it has been seen, is found in other groups of its own family, and in the adjoining family of *Columbidæ*. A group newly discovered in some islands of the Eastern Archipelago, the *Megapodius* of M. Temminck, serves strongly to illustrate these principles and to corroborate my opinion as to the situation of the singular New Holland genus before us. The *Megapodius* brought home to France by one of her late expeditions, is confessedly gallinaceous in its habits, and as such has been placed, without hesitation, among the true *Rasores*, and yet its foot is precisely of the same construction as that of *Menura*.* The bill also shows no very material difference from those of the extreme groups of the *Cracidæ*. To return however to the general affinities of the family, it may again be repeated, that all the latter genera, thus united among themselves, evince an evident approach to the *Columbidæ*, from which, it may be remembered, we commenced our observations on the order. The whole of the groups of the *Rasores*, thus following each other in continued affinity, preserve their circular succession without interruption.' [MENURA.]

Character of the family.

Three toes before, one behind, the latter touching the ground throughout. Head feathered, generally crested: there is often a cere or naked skin at the base of the bill.

Mr. Swainson, 'Natural History and Classification of Birds,' vol. i., p. 153, states, that 'in the family of the *Cracidæ*, which connects the *Insessores* with the *Rasores*, the hinder toe is nearly as long as in the cuckoos, and is considerably more developed than in any other group of raso-rial birds. We will say nothing of the genera *Megapodius*, *Palamedea*, and *Menura*, whose feet are well known to be enormous; or of *Opisthocomus*, because specimens of these

* But see post, *Megapodius*, p. 132.

large and rare birds are not upon our table. Confining ourselves to the genus *Penelope*, we may remark that the toes, considered by themselves, might be taken for those of a cuckoo, if the outer one was only versatile; it is evident also, from the structure of the claws, that these birds are much more arboreal than their congeners, for their claws are more curved; and from their *lateral* and not *horizontal* compression, as well from their acuteness, we conclude that they are very little, if at all, employed in scratching the ground, their structure being similar to those of perchers, and adapted only for clinging. The foot, in fact, of the *Penelope*, is not a rasorial but an *insessorial* foot, for it does not possess any one of the rasorial characters. Even the hind toe, which, in all other rasorial birds, is raised above the heel, is here placed upon the same level as the anterior toes. That no ambiguity should rest on this fact, we beg to call the ornithologist's attention to the particular species now before us, the *P. Aracuan* of Spix, one of the most common of the same genus. How this remarkable formation in the foot of the typical *Cracidae* should hitherto have been completely overlooked, even by those who have speculated so much on the mode by which the *Rasores* and *Insessores* are united, is somewhat extraordinary*; we can only account for it by the custom of examining specimens set up in cases, or on branches, instead of preserving them in skins, in which state they can be handled in all directions. But however this may be, the fact itself decides the long-contested question as to which family of the *Rasores* makes the nearest approach or rather forms the passage to the *Insessores*; while, if this question be reversed, and it is asked which of the *Insessores* makes the nearest approach to the *Rasores*, we need only direct our search among some of the long-legged Brazilian cuckoos, or at once point to the singular genus *Opisthocomus*.

Genera, *Ourax*. (*Pauxi*, Temm.)

Generic character.—Bill short, strong, compressed, vaulted, convex, dilated at the base of the upper mandible into a horny, oval, hard, and elevated substance. Nostrils basal, pierced near the front, hidden, open beneath; head covered with short and close-set feathers. Feet (tarsi) long and smooth.

Example.—*Ourax Pauxi*, Cuv. *The Galeated Curassow*.

[*Ourax Pauxi*.]

Size about that of a small hen turkey. Head and neck covered with short velvety feathers of a rich black. All the rest of the plumage, with the exception of the white abdomen and under tail-coverts, brilliant black, exhibiting in certain positions a slight tinge of green. Tail-feathers tipped with white. Legs red, claws yellow. Iris brown. Bill bright red: the protuberance with which it is surmounted (which is rounded in the young birds, and pear-shaped with the narrow end directed forwards in the adult males) of a livid slate colour; it is more than two inches in length when fully developed, hard and bony externally, and internally cellular, the cells communicating with the cavity of the mouth. This protuberance is not visible till after

* But see ante p. 128, 2nd column.

the first moulting, when it first appears in the form of a small tubercle, and becomes much larger in the male than in the female. In other respects there is little difference between the sexes, and the young are only distinguished by a browner tinge. The windpipe descends for a considerable distance in front of the sternum, immediately beneath the skin, and makes no less than three distinct convolutions before passing into the cavity of the chest. (E. T. Bennett.)

Locality.—Mexico, where the species lives in large companies perching upon the trees. Nest generally made on the ground. The young are led about by the female in the same manner as the hen pheasant or the common hen lead theirs. The first food of the chicks consists of worms and insects, but as they advance, fruits and seeds are added. Hernandez gives a very good description of the bird in his *Historia Avium Novæ Hispaniæ*, cap. cccxii. The Galeated Curassow is easily domesticated and is enumerated by M. Temminck among the birds which bred abundantly in the menagerie of M. Ameshoff before the French Revolution.

In April, 1831, Mr. Yarrell pointed out at a meeting of the Zoological Society the peculiarities of the very elongated trachea of another species, *Ourax Mitu*, Cuv. This organ is produced between the skin and the muscles beyond the sternum, and reaches almost to the vent. It has been figured by Dr. Latham, M. Temminck, and others. The sterno-tracheal muscles extend along the whole of the tube, a disposition which, Mr. Yarrell remarked, prevails with one or two exceptions in all birds in which the fold of the trachea is not included in the bone. (*Zool. Proc.* 1830–31, part 1.) Mr. Bennett (*Gardens and Menagerie of the Zoological Society*) observes that the nostrils in *Ourax Pauxi* are seated behind the protuberance, and are perpendicular in their direction: the membranous cere which surrounds them, he adds, is covered with short velvety feathers.

Crax.

Bill moderate, long, compressed, higher than it is broad at the base, thick, carinated above, curved towards the end, surrounded at the base with a membrane; lore naked; nostrils lateral, longitudinal, pierced in the cere, and partially covered. Head crested with curled feathers. Tail spread out, inclined; tail-feathers, fourteen. Sixth quill the longest. Hallux reaching the ground with the first phalanx.

Example.—*Crax Alektor*, Linn. *Crested Curassow*.

[*Crax Alektor*.]

Description.—The plumage of the *Crested Curassow* is of a deep black, with a slight gloss of green upon the head, crest, neck, back, wings, and upper part of the tail; it is of a dull white beneath and on the lower tail-coverts. Its crest is from two to three inches in length, and occupies the whole upper surface of the head: it is curled and velvety in its appearance, and capable of being raised or depressed at will. The eyes are surrounded by a naked skin, which extends into the cere, and there assumes a bright yellow colour. Size about that of *Ourax Pauxi*. (E. T. Bennett.)

Locality and habits.—‘This species,’ says Mr. Bennett, ‘is a native of Mexico, Guiana, and Brazil, and probably extends itself over a large portion of the southern division of the American continent. In the woods of Guiana it appears to be so extremely common that M. Sonnini regards it as the most certain resource of the hungry traveller whose stock of provisions is exhausted, and who has consequently to trust to his gun for furnishing him with a fresh supply. They congregate together in numerous flocks, and appear to be under little or no uneasiness from the intrusion of men into their haunts. Even when a considerable number of them have been shot, the rest remain quietly perched upon the trees, apparently unconscious of the havoc that has been committed amongst them. This conduct is by no means the result of simplicity, but proceeds rather from the natural tameness and unsuspiciousness of their character. Those however which frequent the neighbourhood of inhabited places are said to be much wilder and more mistrustful, being kept constantly on the alert to avoid the pursuit of the hunters, who destroy them in great numbers. They build their nests on the trees, forming them externally of branches interlaced with the stalks of herbaceous plants and lining them internally with leaves. They generally lay but once a year, during the rainy season; the number of their eggs being, according to Sonnini, from five or six, and to D’Azara, as many as eight. They are nearly as large as those of a turkey, but are white like a hen’s, and with a thicker shell.’ (*Gardens and Menagerie of Zool. Soc.*, vol. ii.)

Mr. Yarrell, in February, 1831, placed on the table of the Zoological Society the *trachea*, among others of *Crax Yarrellii*, Red-knobbed Curassow, a new species described from the Society’s menagerie, and which had recently died. The *trachea* of this species differs from all those previously known, but most resembles that of *Crax alector*, Linn., while in external characters the bird approaches *Crax globicera*, Linn., from which it is distinguished by the redness of its cere, and by a prominence on each side under the base of the lower jaw in addition to the globose knob near the base of the upper. The tube in *Crax Yarrellii* is straight throughout its whole length, except a short convolution imbedded in cellular membrane placed between the shafts of the *os furcatorium*. The *trachea* is narrow, and the fold, invested and supported by a membranous sheath, gives off one pair of muscles, which are inserted externally below the apex of the *os furcatorium*. The lower portion of the tube immediately above the bone of divarication, sends off a pair of muscles to be inserted in the *sternum*. The upper pair of muscles (furculo-tracheal) influence the length of the tube above the convolution. The inferior pair (sterno-tracheal) have the same power over the bronchial tubes and that portion of the *trachea* which is below the convolution. (*Zool. Proc.*, 1830—31, part 1.)

We cannot take leave of the Curassows, properly so called, without drawing the attention of the rural economist to the following observations of the late lamented Mr. Bennett. Speaking of the Zoological Society’s menagerie, that excellent practical zoologist says, ‘Of all the gallinaceous birds in the collection, the most interesting are those which hold out to us a prospect of supplying our farm-yards with new breeds of poultry of a superior kind. Such are especially the Curassows. In many parts of South America these birds have long been reclaimed; and it is really surprising, considering the extreme familiarity of their manners, and the facility with which they appear to pass from a state of nature to the tameness of domestic fowls, that they have not yet been introduced into the poultry-yards of Europe. That with proper treatment they would speedily become habituated to the climate we have no reason to doubt; on the contrary, numerous examples have shown that they thrive well even in its northern parts; and M. Temminck informs us that they have once at least been thoroughly acclimated in Holland, where they were as prolific in their domesticated state as any of our common poultry. The establishment however in which this had been effected, was broken up by the civil commotions which followed in the train of the French revolution, and all the pains which had been bestowed upon the education of these birds were lost to the world by their sudden and complete dispersion. The task which had at that time been in some measure accomplished, still remains to be performed; and it may not be too much to expect that the Zoological Society may be successful in perfecting what was then so well begun, and

in naturalizing the Curassow* as completely as our ancestors have done the equally exotic, and in their wild state, much less familiar breeds of the turkey, the Guinea-fowl, and the peacock. Their introduction would certainly be most desirable, not merely on account of their size and beauty, but also for the whiteness and excellence of their flesh, which is said by those who have eaten of it to surpass that of the Guinea-fowl or of the pheasant in the delicacy of its flavour.’ (*Gardens and Menagerie*, &c., vol. ii.)

Lieutenant Maw, who appears to have shot a Red-knobbed Curassow, on his passage from the Pacific to the Atlantic down the river Marañon, says that the native Peruvian name for the bird is *Peury*.

Penelope.

Bill moderate, naked at the base, entire, convex above, wider than it is high, bent at the point; lore and base of the bill naked. Under the *throat* a naked skin which is capable of being inflated or swollen. *Nostrils* pierced in the cere towards the middle of the bill, half closed. *Foot* (tarsus) slender, longer than the intermediate toe; nails somewhat curved, strong, compressed, and pointed. Fifth and sixth *quill* longest. *Tail-feathers* twelve.

Example.—*Penelope cristata*, Gmel. The Guan.

Description.—Length about thirty inches, the tail being thirteen or fourteen. Upper parts dusky black or bronze, glossed with green, changing to olive in certain lights. A black stripe passes from the under part of the bill backwards and surrounds the ear. Fore part of neck and breast spotted with whitish, each of the feathers being bordered by white; belly and legs, lower part of the back, and under tail-coverts, reddish. Cheeks naked and violet purplish. Iris reddish brown. Bill blackish. Feathers of the back of the head long, forming a thick tufted crest, which the bird can raise or depress at pleasure. Naked part of the throat scarlet, with a contractile and extensile fold of depending skin. Mr. Bennett observes that this fold retains its elasticity after death. The female differs from the male principally in having her plumage, especially her under parts, more decidedly tinged with red.

Mr. Yarrell (*Zool. Proc.* 1833, part i.) states that the *trachea* of the Guan is uniform in size and substance throughout its whole length. After descending by the neck in the usual way, it is extended and passes downwards under the skin, but over the outer surface of the pectoral muscle on the right side, to the extent of two inches beyond the angle formed by the junction of the two portions of the *os furcatorium*. The tube of the *trachea* is then reflected, and ascending to the cavity of the thorax, again turns to be carried to the lungs as in other birds, and is provided with one pair of true muscles of voice, which have the usual origin and insertion. The loop or fold of the tube formed on the surface of the pectoral muscle is imbedded in cellular tissue, and further retained in its place by a strong ligament, which firmly adhering to the loop, passes backwards to be first attached to the posterior angle of the *sternum*, and afterwards dividing once, and passing still further backwards, the two slips are inserted on the two elongated pubic points of the *pelvis*. This structure in the Guan, Mr. Yarrell observes, has been noticed and figured by Mr. Temminck, in his ‘*Histoire des Pigeons et Gallinacés*.’

Mr. Bennett remarks that the manners of the Guan have little to distinguish them from those of the curassows. Although to all appearance equally capable of domestication, they have not yet been introduced into Europe in equal numbers with the curassows, nor has the same success attended the attempts to propagate them in this quarter of the globe. ‘We are told however,’ continues Mr. Bennett, ‘by M. Temminck, that the proprietor of a menagerie in the neighbourhood of Utrecht had bred them for several years; and there can be little doubt that with proper care and attention these birds might be added to the stock of our domesticated fowls. They are spoken of as furnishing an excellent dish for the table. In a wild state they inhabit Guiana and Brazil, and perhaps extend still further to the north. Their food consists principally of seeds and fruits, which they search for and eat upon the ground: but the greater part of their existence is passed upon the trees, on the tops of which they perch, and in which they build their nests. They are often found in

* One of the six medals offered as premiums by the Zoological Society of London is ‘to the breeder of the greatest number of curassows in the year 1837.’ This is as it should be.

large bands, but generally pair together with the strictest constancy. The females lay from two to five eggs. Their flight, like that of most gallinaceous birds, in consequence of the shortness of their wings, is low and heavy; and in the performance of this action they derive much assistance from their tail, the feathers of which may be expanded in the shape of a fan. All the birds of this genus appear to be known in Brazil by the name of *Jacu*, pronounced *Yacou*, derived, according to Marcgrave, from their note. This, as might be expected from the conformation of their trachea, is extremely loud, insomuch that when a considerable number are collected near the same spot, the very woods, to use the expression of the scientific traveller just quoted, re-echo with their clamorous cries.' The same author observes that M. Spix added very considerably to the difficulties that previously existed in distinguishing the species of this interesting group, by the publication, in his 'Brazilian Birds,' of a series of figures representing apparently very slight modifications of the common form, but to each of which he has prefixed a peculiar specific name. Mr. Bennett expresses his belief that most of these will be found on further examination to be referable to the present species, which, from its long domestication in the poultry-yards of South America, must necessarily be subject to very extensive variations. (*Gardens and Menagerie of the Zool. Soc.*, vol. ii.)

[*Penelope cristata*.]

M. Lesson, on the authority of M. Goudot, mentions a species, *Penelope Aburri*, Goud., two feet three inches (French) long, the tail being ten inches. M. Goudot states that this species seems peculiar to the mountains of New Grenada, inhabiting temperate and cold districts; it is, he says, unknown in the great warm valleys and by the rivers. In the environs of the city of Muzo, celebrated for its mine of emeralds, this bird, he states, is known under the name of *Pavo-à-guali*. The inhabitants of the neighbourhood of Bogota and of the valley of Cauca designate it by the term *Pava Burri*, or *Aburri Aburrida*, which when slowly pronounced well expresses its cry. The male does not differ from the female; and those which M. Goudot opened had two cæcums analogous to *Penelope Parakona* and *Pavita (superciliaris?)*. The trachea descended without any fold to the lungs. There was no gravel in the gizzard, the walls of which were thin, and nearly entirely covered by the proper muscles. M. Goudot states that the species lives solitary, perches upon high trees, flies but little, and suffers the hunter to approach easily within shot. It is never seen on the ground. The berries of trees compose its food. Its nest is formed in a mass of dry leaves, disposed between the forks of trees. The eggs are three in number, white, and one inch eight lines in diameter. These birds, adds M. Goudot, are very common in the mountains of Quindiu, between Ilaque and Carthagena. Their notes are the last that are heard on the approach of night, and the first that announce the dawn of day.

Ortalida.

Characters the same as those of *Penelope*, excepting that the head is completely feathered, and that there is no nakedness about the throat or round the eyes.

Example.—*Ortalida Motmot*, *Phasianus Motmot*, Gmel., *Phasianus Parraqua*, Lath. Colour red brown, bronzed above. Tail moderate. Locality.—Guiana.

[*Ortalida Motmot*.]

M. Goudot describes a new species from Santa-Fé de Bogota, which M. Lesson names *Ortalida Goudotii*. The bird, it appears, is found in the same places with the *Penelope Aburri*. Total length 23 inches, of which the tail is 9. Feet red; tarsus 2 inches 5 lines; middle toe 2 inches 4 lines, the claw being 5 lines and a half (French). The bill is blackish, brown at its point; the upper mandible 1 inch 5 lines; cere and naked membrane round the eyes blue. All the upper plumage brown, with deep green reflections, or rather of a very deep greenish. Feathers of the throat grey. Bottom of the neck, belly, and abdomen, as well as the thighs, covered with ruddy. No crest nor nakedness about the throat. No fold of the trachea in either sex. Locality.—The mountains of Quindiu.

M. Lesson observes that this bird approaches nearly to the last, but is clearly distinguishable from it, especially by the trachea, which does not descend upon the abdomen.

Opisthocomus, Hoffm. (Hoazin, Buff.; *Orthocorys*, Vieill.)

Bill thick, robust, short, convex, bent at the point, which is suddenly compressed, furnished with diverging bristles at the base, which is dilated laterally; lower mandible strong, terminated in an angle; edges denticulated towards the origin. Nostrils mesial on the surface of the bill, pierced (*de part en part*), covered above by a membrane. Feet robust and muscular; tarsus shorter than the middle toe, the lateral toes long, equal, entirely divided; sole broad; toes bordered with rudiments of membranes. Wings moderate, the first quill very short, the four following graduated, and the sixth the longest. Tail-feathers ten. Example.—*Opisthocomus cristatus*.

[*Opisthocomus cristatus*.]

This species, which appears to be the only one belonging to the genus, is the *Hoatzin* and *Hoactzin* of Hernandez; who describes it (p. 320) as an inhabitant of warm districts, where it was seen sitting on trees by the sides of rivers, and as having received its name from a supposed similarity of the shrieking cry of the bird to the intonation of the word *Hoatzin*. Hernandez relates some strange stories of cures effected by its bones and by a suffitus of its feathers; but says that the bird is deemed inauspicious by the natives. Sonnini states that it is known in Guiana by the name of *Sasa*.

The *Hoazins* are said to live in pairs or in small troops, consisting of from six to eight individuals, in the flooded savannahs, which they prefer, and where they seek for their food the leaves of the *arum arborescens*. Their flesh is not considered good, having a strong smell of *castoreum* about it. These birds are by no means timorous: in stature and gait they resemble the peacock.

Megapodius.

Bill slender, straight, as wide as it is high, and flattened above at the base; upper mandible longer than the lower, slightly curved at its extremity; lower mandible straight, the point hidden by the edges of the upper mandible. *Nostrils* suboval, open, placed nearer to the point than to the base of the bill, nasal fossæ long, covered by a membrane furnished with small feathers. Space round the eye naked, head and neck well feathered. *Feet* large and strong, placed far backwards; tarsus large and long, and covered with large scales, compressed posteriorly; four very elongated toes, the three anterior ones nearly equal, united at their bases by a small membrane, which is more apparent between the inner and middle toe than between it and the outer one; posterior toe horizontal, touching the ground throughout its length; claws very long, very strong, flattened above, very little curved, triangular, obtuse at the point, nearly like those of *Menura*. *Wings* moderate, concave, rounded; third and fourth quills the longest. *Tail* small, wedge-shaped, scarcely exceeding the wings in length, and formed of twelve feathers. (Quoy and Gaimard, with slight alteration.) Example.—*Megapodius Duperreyi*.

Description.—In size hardly so large as a partridge. Tarsi less elevated than they are in *Megapodius Freycinetii* and *M. rubripes*. The bird is, moreover, altogether better proportioned. Total length, from the extremity of the bill to that of the wings, which are longer than the tail, rather less than a foot (French). Tarsi strong, covered with scales, and 20 lines in length; middle toe, including the claw, 17 lines, hind toe 14, posterior claw 7. Bill slightly swollen towards its extremity, yellow, 8 lines in length. Nostrils suboval, covered with a membrane clothed with very small rudimentary feathers. Space round the eyes naked, but less than in the other two species. Neck well clothed with feathers. Iris reddish. A very thick crest covers the head; the feathers which compose it are raised (se redressent) towards the occiput. The wings are concave, an inch longer than the tail, and terminated in a point: the fifth quill the longest. Tail suboval, pointed, very short, composed of ten small feathers. Legs greyish, and feathered down to the tarsi; the claws slightly curved, pointed at the end, flat below, and of a brown colour. (Lesson.)

'The tuft,' says M. Lesson, 'of our *Megapodius Duperreyi* is of a brown yellow; the neck, the throat, the belly, and the lateral parts, are of a grey slate colour. The feathers of the back and the wing-coverts are large, and of a ruddy yellowish brown. Rump, upper part of the tail, and vent-feathers ochreous red. Quills yellow without, brown within, the shafts being ruddy brown.'

'The middle toe is united to the inner one by a membranous border, which is wanting between the middle toe and the external one.'

'In comparing our *Megapodius* with the *Menura* of New Holland, we cannot fail to perceive that it connects the last-mentioned genus with the gallinaceous birds, by forming a very natural passage. In fact, if we examine the position of the nostrils, the general form of the bill and legs, and the nakedness round the eyes—the membrane which unites the two external toes, but which is wanting between the middle toe and the inner one (an arrangement which is reversed in *Megapodius*)—the same length of the toes, the analogy in the form of the claws, the greater length of the posterior one, the concavity and the smallness of the wings—all these characters, in fine, coincide to confirm this pas-

sage, if we except the extraordinary grandeur and luxuriant form of the tail of *Menura*, a form without analogy among the other birds. *Megapodius* would thus belong to a small natural group, the *Lyriferi* of Vieillot (27th family); the name of which, in consequence of its having become improper, would have to be changed.'

Locality.—'*Megapodius Duperreyi*, the *Mangoipe* of the Papuans, inhabits the umbrageous forests of New Guinea, in the neighbourhood of the harbour of Doréry. The bird is timid, runs very fast among the bushes, like a partridge in standing corn, and utters a feeble cluck (un petit gloussement).' (Lesson.)

[*Megapodius Duperreyi*.]

M. Lesson states that he only observed *Megapodius Freycinetii* in the Island of Waigiou, and that the attempt to preserve it alive in cages was vain, for the birds soon died. Their flesh, he says, is black, very hard, and not very agreeable as food, although possessing a *fumet* which the cooking develops. The Papuans brought them on board the *Coquille* daily, and called them (those of the harbour of Offack at least) *Manesaque*.

Both Pigafetta and Gemelli Carreri speak of the *Tavon* (*Megapodius*), and it would seem that this, the *Megapodius* of the Philippines, leaves its eggs to the fostering heat of the sun. The habits of the *Megapodii* of New Guinea and the neighbouring islands are, according to M. Lesson, entirely unknown.

Alethelia.

The characters of the genus *Megapodius*, observes M. Lesson, established by MM. Quoy and Gaimard in the Zoology of the voyage round the world performed by the *Uranie*, are in great measure applicable to the subgenus *Alethelia*, formed by M. Lesson for the position of a bird which differs from the true *Megapodii* or *Tavons*, by many distinctive characters.

Bill short, compressed, pointed: the upper mandible prolonged, the lower mandible a little swollen and very short. *Nostrils* at the base of the bill separated by a straight ridge. *Head* and forehead abundantly covered with feathers down to the nostrils. Space round the *eyes* furnished with short and close-set feathers. Inner *toe* rather the shortest, membrane which unites the middle toe to the inner one almost absent. No *tail*. All the feathers of the body, except those of the wings, composed of loose barbs, very finely ciliated on each of the shafts.

Example.—*Alethelia Urvillii*, Lesson, the only species known.

Description.—Total length from the extremity of the bill to that of the wings, 5 inches 4 lines. Tarsi 14 lines; middle toe 10, hind toe 8, claws 5, bill 6 (French). The bird is covered with loose and scanty feathers, but has upon the occiput a thick bunch of feathers. The general tint is brown, fuliginous, deepest above. Belly and throat brown, slightly tinged with ruddy colour; throat ash-coloured

Wings concave, rounded, the feathers entirely brown, the second, third and fourth being equal; the upper part is brown sprinkled with zigzag or irregular lines, not well defined, of ruddy yellow. Place of the tail-feathers supplied by very loose plumes, composed of very fine barbs, bristled with very slender approximated barbules, presenting much analogy with those of the Cassowary (No. 6, pl. 67, *Atlas de Peron*), and which, implanted in the rump in the same manner, form a feathery tuft as in the Cassowary; all the feathers of this bird, except those of the wings, are composed of multiple stems, very slender and soft, furnished with equal and very fine barbules which may be called *multirachid*. The bill is greyish, and so are the feet. The inner toe is a little more united to the middle one than to the external one. The claws are slightly curved, sharp, convex above, concave below, and of a brown colour. The iris is reddish.

Locality.—This species, which comes from the Isle of Guebé, placed immediately under the equator, is, no doubt, proper to the neighbouring lands such as the great and beautiful Isle of Halamiva or Golilo, so little known and so little studied by naturalists. (Lesson.)

[*Alethelia Urvillii*.]

CRACOW, a republic in the north-eastern part of central Europe, formerly part of the woywodship or palatinate of the same name in the kingdom of Poland. It lies between Austrian Galicia, Prussian Silesia, and the south-western part of Russian Poland. With regard to size, it is the fortieth, to population the thirty-seventh, and according to density of population the seventh, in the series of European states. It is the only vestige that remains of Polish independence.

Cracow lies on the northern bank of the Vistula, and contains an area of about 490 square miles. The surface consists of an undulating plain, broken by low hills and woods, and extends to the banks of the Vistula, which forms its southern boundary towards Galicia. The Vistula, which is the chief river of Cracow, receives within the confines of the Republic, the waters of the small rivers Czerna, Przemza, Radewa, Monuszka, Chobka and Wolika, and becomes navigable under the walls of Cracow. There are neither canals nor lakes in the country; at Krzeszowice there are warm sulphurous springs. The climate is moderate, though not genial enough to ripen the grape; it is however salubrious and agreeable, and milder than in the other parts of Poland. The soil is rich, but as agriculture has made little progress, it produces scarcely more grain than is sufficient for the consumption of the inhabitants. Yet Cracow is considered the most cultivated portion of Poland. The vegetables and fruits are excellent. Its chief productions are corn, pulse, flax, wood, oxen, sheep, swine, game, fish, wax, and honey; also coals, iron, marble, freestone, clay, &c. but the quantity of wood is inconsiderable, and the iron found is not sufficient to supply even the single works at Krzeszowice.

Cracow contains only two or three manufacturing establishments, the chief of which are the ironworks of Krzeszowice. The peasantry spin and weave their own cloth, and there is little trade except in the capital. The republic is divided into

land and town districts; the first must have a population of more than 2000; the latter of more than 2500; each district has its starost; and three districts form a circle with a justice at its head. The population are chiefly of Polish extraction, there being only from 400 to 500 Germans, and between 10,000 and 11,000 Jews; it amounted in 1803 to 93,100; in 1819 to 95,822; in 1826 to 118,000; and in 1832 to 123,157. It has a militia of 300 men, and a gendarmerie of 40; but no regular troops. Although the established religion is the Roman Catholic, all Christian denominations enjoy liberty of conscience and worship; the number of Protestants is about 1700.

The yearly income and expenditure as fixed by the Chamber of Representatives for the period 1833—1837 is 1,775,766 Polish florins, or about 44,500*l.* sterling. Cracow contains 2 towns, 2 market-towns, 71 villages and hamlets, 16 monasteries, with 87 monks and 69 lay brothers; 10 nunneries with 164 nuns; 100 churches. The bishop of Cracow has a chapter of 16 canons.

In the partition of Poland in 1795, Cracow fell to the share of Austria, and in 1809 was erected, with the whole of western Galicia, into the grand duchy of Warsaw. Its existence as a republic, dates from the Congress of Vienna in 1815, when the three great powers, Austria, Russia, and Prussia, not being able to agree to which of them it should be assigned, determined to form it into an independent republic under their joint protection, guaranteeing to it the perpetual neutrality and inviolability of its territory, except in the case of its affording an asylum to deserters, or offenders against any of the three protecting powers.

By the constitution of the Republic of Cracow, there is no distinction of ranks; all are equal in the eye of the law. The legislative authority is vested in a body of representatives elected by each district, three members of the senate (one of whom is president of the assembly), three canons of the chapter of the cathedral, three doctors of the university of Cracow, and six judges of the tribunals. This body annually holds a session in December, which continues about a month; makes laws, votes the budget, inspects the administration, nominates two-thirds of the senators as well as the judges, &c. The executive power is lodged in a senate of twelve members and a president, who, with eight of the senators, is nominated by the legislative assembly; two are chosen by the chapter and two by the university. Of the senators, eight are chosen for life, and four are elected annually; the president is chosen for three years. The senate draw up laws previously to their being laid before the legislature; and appoint to such civil and ecclesiastical offices as are not dependent on the chamber of deputies.

CRACOW (in Polish, Krakoo), the capital of the republic of the same name, is situated at the foot of Mount Krakus or Wavel (699 feet above the level of the sea), in the delightful and extensive valley of the Vistula, and on the left bank of the river, at its confluence with the Radeva, in 50° 4' N. lat., 15° 15' E. long. It is enclosed by three hills; the St. Bronislava, on which a monument, 120 feet high, has been erected, in memory of Kosciusko; the Krakus or Wavel, and the Wanda. It is united to the Austrian town of Podgorze by a bridge of rafts 145 feet long.

Cracow is surrounded with promenades, which have replaced the old ramparts, walls, and towers. It consists of three distinct quarters, Cracow, Stradom, and Kazimierz, which last lies on an island in the Vistula, and is joined to the town by a bridge. It is the residence of the Jews, who have here a synagogue. The suburbs are likewise of some extent.

This antient capital of Poland, where its kings were crowned and buried, received its name from Krakus, duke of the Poles and Bohemians, or White Chrobatia, who is said to have founded Cracow about A.D. 700. It was wrested from the Moravians by Ziemowit, the Bohemian, and was taken from the Bohemians in 999 by Boleslaus the Great, who raised it to the rank of the capital of Poland. Its antient limits were far more extensive, and its population treble the present amount. It had a flourishing commerce, and its numerous lofty towers and buildings still give to it, in the distance, the appearance of a large and handsome city; but this impression is destroyed on entering its dark, narrow, and deserted precincts. The town is however clean, and has a very spacious public square, surrounded with low miserable shops.

The most striking of its antient monuments is the cathedral, a beautiful specimen of Gothic architecture, and the finest in Poland; it was destroyed by fire, and rebuilt by Nanker, bishop of Cracow, in the year 1320. Here the kings of Poland were crowned, and its numerous chapels recall the events of the history of this kingdom, from Boleslaus to Kosciusko. It has 50 altars, above 20 chapels, and contains the tombs of most of the Polish monarchs, of Casimir, John III., Sobieski, St. Stanislaus, whose remains are enclosed in a silver coffin, Prince Poniatowski, Kosciusko, and Dombrowski, &c. The archives and library preserved in this edifice contain many valuable manuscripts. Its bell, the largest in Poland, was cast in 1520.

The castle, called the Königsburg, on Mount Wavel, a very spacious Gothic structure, the first building of which was, as is said, the work of Krakus about the year 700, suffered by two great conflagrations. It was restored to its pristine splendour by Augustus II. of Poland. It was fortified by Dumourier in 1768, and repaired when in possession of the Austrians, who converted it into barracks. Its subterranean vaults, which are excavated in the mountain, were formerly the depository of the royal regalia. Of the 71 churches which Cracow once contained, only 38 are at present devoted to the purposes of divine worship. The finest of these are St. Mary's, which is second only to the cathedral; the Protestant church of St. Martin, and many magnificent convents, of which several were abolished by the Austrian government. The other remarkable edifices are the episcopal palace, a spacious building of modern construction, with an historical museum for Sarmatian remains; the old Town Hall, a quadrangular, tower-like structure, evidently built for defensive purposes, &c. The Roman Catholic University, which was founded in 1364 by Casimir the Great, and in 1780 assumed the title of Schola Regni, is the oldest, and was formerly the only university in Poland. It contains a library, chiefly of old books, and a collection of 5000 MSS., principally on theology; an Observatory, situated in the suburbs of Wessola; a cabinet of natural history, &c. It has four faculties; in 1817 it had 131 students, and since then never more than 250 or 300, although it is open to all Poles under the Austrian, Russian, or Prussian dominion.

There are, besides, in Cracow, a Piarist college and gymnasium, normal, and various elementary schools, 5 hospitals, an orphan asylum, &c. The town contains nearly 2000 houses. Under Sigismund I. Cracow had 80,000 inhabitants; in 1818 they had dwindled down to 24,556, and at the present day their number is about 24,900. There are no manufactures, except a few of cloth and woollens. The trade, which is principally in the hands of the Jews, is not extensive, although Cracow is the chief depôt of Hungarian wines, salt, and wax, and the central point of commerce between Poland and part of Galicia and Hungary.

Near Cracow is Lobzoff, a summer residence of the former kings of Poland; it was built by Casimir the Great, whose mistress, Esther, a Jewess, was buried in the gardens belonging to it.

CRA'CTICUS. [BARITA.]

CRADLING, slight timber-framing constructed under floors in order to form arched or coved ceilings to this timber-work the lath and plaster is attached. The same term is applied to the rough framing to which the entablature and cornice of a shop-front may be attached.

CRAIG, JOHN, was educated at St. Andrews, Scotland, and then became a tutor in England to the children of Lord Dacre. Returning to his native country when the two kingdoms were involved in war, he entered the Dominican order, but was shortly afterwards imprisoned on a suspicion of heresy. On regaining his liberty, he went into England again, thence to France, and finally to Rome, where his talents recommended him to the notice of Cardinal Pole, under whose direction he entered the Dominican order at Bologna. Here he became entrusted with the education of the novices, and was also employed in various ecclesiastic missions throughout the continent; and for his important services was rewarded by the appointment of rector to one of the schools of the order. Having afterwards become a convert to the opinions of Calvin, he was seized, and accused of heresy, then sent to Rome, where, after an imprisonment of nine months, he was summoned to stand his trial before the court of Inquisition. Here he made a bold confession of his faith, and, being accordingly convicted, was condemned to be burnt.

It happened, however, that on the night previous to the day on which this sentence was to be put in execution, the pope died, and the populace rejoicing to be free from his yoke, rose in a tumultuous manner, and broke open the prisons. Craig came forth from his cell, and fled to Vienna, whence, after remaining there a short time, he was dismissed by the emperor with letters of safe conduct, under the protection of which he passed through Germany into England, and thence to Scotland, where he arrived soon after the establishment of the Reformation. He preached for a short time in Latin to the learned in St. Magdalen's chapel, when, having recovered his native language, he was appointed minister of Holyrood-house, and became a principal coadjutor of Knox, the great Scottish reformer, in the work of reformation. He was afterwards appointed minister of Montrose, and in 1574 minister of Aberdeen, in which capacity he was chosen Moderator of the General Assembly of the church of Scotland, which met in October, 1576. The following year he was removed to Edinburgh; and in 1579 was associated with the learned John Duncanson as minister to the royal household.

Craig drew up the National Covenant in the year 1580; he was also the author of two theological works; the one an answer to an attack on the Confession of Faith, the other a form of examination entitled Craig's Catechism, which was appointed by the General Assembly to be used in schools and families in place of 'The Little Catechism.'

He died at Edinburgh, on the 12th December, 1600, at the advanced age of 89; but for some years before had performed no public duty. (See M'Crie's *Melville*; and Tytler's *Life of Sir Thomas Craig*.)

CRAIG, SIR THOMAS, of Riccarton, was, according to Baillie's biographical notice of him prefixed to the last edition of his celebrated Treatise on the Feudal Law, the son of Mr. Robert Craig, merchant in Edinburgh, a descendant of the Craigs of Craigston, in Buchan; though, as we shall afterwards find, this statement has been disputed. Baillie says that Craig was born about the year 1548; but this is plainly a mistake, for in 1552 he was sent to the university of St. Andrews, and entered as a student of St. Leonard's, a college which had been erected about forty years before 'for training up poor scholars in learning and the arts, to the glory of God, and the spiritual edification of the people.' He remained here only till he proceeded bachelor of arts, when he went to France to prosecute his studies in the university of Paris. On his return to Scotland, about 1561, the Reformation had just been accomplished there; and his distinguished relative, the Rev. Dr. John Craig, was then minister of Holyrood-house. This learned divine had himself arrived in Scotland only a twelve-month before. Under the care of this eminent person the religious views of young Craig were changed, and, devoting himself entirely to study, he left nearly all his youthful contemporaries in literature far behind him.

He passed advocate in the Court of Session at Edinburgh on the 2nd February, 1563; and in July that year we find him in the judicial situation of justice depute to Archibald, fifth earl of Argyll, hereditary lord justiciar of Scotland (*Abstract Books of Adjournal, MS. Adv. Libr.*), an ardent friend of the Reformation. In May, 1564, he had a grant from the crown of the escheat of Alexander Innes, of Crombie; and in the following January, another grant from the crown of the unlaws or amerciements of any six persons he might choose among those unlaured in the justice courts, and this *so long as he should enjoy the office of justice depute*.

His first appearance as an author was on occasion of the queen's marriage with her cousin Darnley, for which he composed an epithalamium, or marriage song. The piece, which is not to be found among Craig's poems in the 'Delitiæ Poetarum Scotorum,' was only lately discovered. As described by Tytler, it is in its general tone too full of effort, too ambitious in the display of classical allusions, and too richly and laboriously coloured, but not without some passages of beauty and simplicity. The little offering was tendered to a woman—a queen—a bride, and all these centred in one who was not inattentive to the interests of learning. On the 24th October that year, Craig had a grant from the crown of the unlaws above mentioned *during his life*.

In his office of justice depute Craig appears to have been particularly zealous. A remarkable instance of this occurred the following month. On the 14th November, 1565,

one John Pigget was indicted before him for the murder of one Agnes Robertson; and what is singular, there was produced in evidence a certificate in Latin by Craig himself of the fact of Pigget committing the murder by assault; and moreover we find Craig protesting for an assize of error, or writ of attain, in case the jury should acquit the prisoner. (*Abstract Books of Adjournal, MS. Adv. Libr.*) Conduct like this shocks our feelings of judicial propriety; yet we must condemn it with lenity, and would impute it to the times rather than to the man. On the 18th of December he had a grant from the crown of the escheat of Alexander Dunning of Westercreeff; and the week following, a grant of the escheat of James Johnston, in Middlegill, and others. In looking at these grants of escheat, we must bear in mind, that in the times we speak of, the judges were commonly paid out of the issues of their court, and it is probable that Craig had then no other source of remuneration. In 1574 however, when, as we shall find, he was promoted in his profession, he received from the lord treasurer 120*l.*, being his fee as justice depute for three years from Whitsunday, 1571, at the rate of 40*l.* a year, which was an allowance equal to that then paid to the lord advocate. Craig presided in the court of justiciary held in April, 1566, where Thomas Scot, the sheriff depute of Perth under Lord Ruthven, the hereditary sheriff, and Henry Yaire, a priest, servant to the Lord Ruthven, were adjudged to be hanged and quartered, and their heads set upon the turret of the buildings adjoining the royal palace, under the suspicion of having been accomplices in the murder of Rizzio, who was openly assassinated in the queen's presence by the Lord Ruthven, the Lord Chancellor Morton, and others, at the head of whom was Darnley himself.

On the 19th of June following, the queen was delivered of a son, and Craig again appeared as a court bard, hailing the birth of the young prince in a *Genethliacum* in *Jacobi principis Scotorum*. He seems soon afterwards to have married Helen Heriot, daughter of the influential laird of Traborun, in the county of Haddington; and in 1569 his eldest son Lewis was born.

Craig continued in the office of justice depute till the end of the year 1573, when he was appointed sheriff depute of Edinburgh, under the earl of Morton above mentioned, the hereditary sheriff, to which place and that of admiral of Scotland the earl was appointed by the regent Murray, in 1567, not long after he had been reinstated in the chancellorship; and Craig's younger brother Robert was made justice depute in his room. From the beginning of the year 1576 Craig was in the courts as a practising counsel down to the beginning of the year 1581. Morton was that year committed to Dumbarton castle for his supposed concern in the murder of Darnley; and the same year Craig was ordered to enter his person in ward in the same castle of Dumbarton. Craig at last obtained his liberty, but was not replaced in the office of sheriff depute.

In April of the above year, 1576, Craig got a crown charter of the estate of Craigfintray, in the county of Aberdeen, to himself and his heirs male; whom failing, to his brothers John, James, Robert, and Oliver, and their heirs male; whom failing, to the heirs male whatsoever of William Craig, of Craigfintray, bearing his name and arms; the charter proceeding on the resignation and surrender of the said William Craig to the above effect. The precise relationship existing between these persons is not known; but from the destination Mr. Tytler supposes that William Craig was the father of the above brothers. He accordingly disputes Baillie's account of our Craig's lineage, and adds that he was the heir of the property and the representative of the family of Craig of Craigfintray. But there are reasons for not concurring in Mr. Tytler's opinions which seem to us conclusive.

In April, 1588, Craig obtained a crown charter of the lands of St. Lawrence Houses, in the county of Haddington, to himself and Helen Heriot, his wife; and from about that time forward we find him again in practice at the bar. He resumed also his poetic pen, and wrote some commendatory lines to Jacks Onomastichon, published in 1592. The same year the king brought a reduction of some deeds and conveyances executed by his Majesty under influence on his minority; and Craig, who had now been about thirty years at the bar, and enjoyed a very high professional reputation, was taken into the cause to assist Skene and old M'Gill, the crown counsel.

It was probably about this time that Craig contemplated his great work on the feudal law. Such a work was in a manner new to the law literature of Scotland. The learned King, his junior at the bar, had improved upon his predecessor, Kintore, and composed a *Treatise on Maritime Law*,—probably the first regular work on that branch of jurisprudence in Britain; and Balfour's '*Practicks*' were well known. But no Erskine had yet arisen, no Stair, no Mackenzie; and Hope was at this time but a '*servitor*' to Nicholson, who, like most of his brethren, regarded Sharp and Craig with the awe due to a superior order of beings. But Craig narrowed his powerful mind, its fancy and genius, and all its accumulated stores of learning and experience, to a temporary object; and to adopt the sentiment if not the language of one who had weighed his merits, instead of seizing the precious opportunity he enjoyed of presenting to his country a just system of her national jurisprudence, he not only passed by the evidences of her common law which lay beside him, but endeavoured to sink them into oblivion in favour of the civil and feudal laws. (*Ross's Lectures*, vol. ii. pp. 9, 10). He had scarcely risen from his learned labours however, when he found that Elizabeth was on the eve of her demise; and that various intrigues were carrying on and cabals formed to secure her crown, with a view to the king's succession to which his treatise on Feuds was composed. On the 1st of January, 1603, therefore, he dedicated to the king a treatise on the Succession to the Throne of England, which he had written in confutation of the jesuit Parson's Conference on the Disputed Succession, wherein the right of the people to choose their king was boldly reasoned, and the crown indirectly claimed for the infanta of Spain. But in less than three months after, the queen repeated on her death-bed her former declaration that her cousin the king of Scots should be her successor. James accordingly ascended the throne of England without dispute; and Craig's reply to Doleman was never printed.

On the king's departure for England with his family, Craig wrote a *Paræneticon* of congratulation: and on the same occasion, a *Propempticon*, or farewell poem, to the young prince Henry. The same year he composed his '*Stephanaphoria*,' in honour of the king's coronation; of which ceremonial Craig seems to have been a witness, having, in all likelihood, accompanied the royal party into England; and previous to his return home he addressed to the king a short poem, in which he took a solemn farewell of his Majesty, and, at the same time, of the Muses.

Soon after his return Craig was appointed one of the commissioners nominated by the parliament to meet with commissioners from England and treat of a union between the two kingdoms; and thereupon in the summer of 1605 he wrote his treatise on the union. About the same time he wrote his treatise on homage, to vindicate Scotland from the charge of feudal dependence on the crown of England, brought against it in the chronicles of Hollinshed. Neither of these works was ever published; and the latter doubtless for obvious reasons. The tilt against the old chronicler by a knight so well accomplished as Craig can be enjoyed in the closet; but it would have been unwise to set the lists before the world, or renew feelings of jealousy between nations now united under one and the same crown.

It is probable that Craig had the offer of a seat on the bench, though he was never raised to it; but his son Lewis was, somewhere between the month of February, 1604, and the month of June, 1605, knighted, and admitted as an ordinary lord, when he had been little more than four years at the bar.

In the year 1606 Craig held the office of advocate for the church of Scotland; and some time before his death, as he would not formally accept the honour of knighthood, the king commanded that he should be everywhere saluted by the style accorded to that honour.

The particulars of his death are not known; it took place on the 26th of February, 1608, when he had been upwards of forty-five years at the bar, and probably therefore when he was not much short of seventy-five years of age.

CRAIG, JOHN. The dates of his birth and death are unknown; but he was alive in the interval 1685-1718. He was a Scotchman by birth, and was rector of Gillingham, in Dorsetshire. He deserves remembrance as one of those who were active in developing the principles of the theory of fluxions after its appearance. His writings are partly

in the Philosophical Transactions, and partly published separately. The latter are, 'De Calculo Fluentium,' London, 1718, with two books 'De Opticâ Analyticâ.' 'De Figurarum, &c. Quadraturis,' London, 1693. There had previously, in 1685, appeared a tract on the same subject. 'Theologiæ Christianæ Principia Mathematica,' London, 1699, a very silly attempt to apply numerical reasoning to historical evidence. He concludes from a formula that the evidences of Christianity will be extinct by lapse of time in 1454 years from 1696, or A.D. 3150, at which date he therefore places the commencement of the Millenium. Craig is called by some continental writers the introducer of the theory of Leibnitz into England. [FLUXIONS.]

CRAMBE MARITIMA, or **SEA KAIL**, is a glaucous spreading plant, with broad-toothed sinuated leaves, and dense corymbs of large white flowers, found occasionally on the sea-coast of England, and now commonly cultivated in gardens for the sake of its delicate tender shoots. Naturally the flavour of the plant is strong, cabbage-like, and highly disagreeable, but in the state in which it is sent to the kitchen, it is merely a colourless mass of delicate fleshy vegetable tissue, with little or no flavour. This arises from the shoots that are to be cooked being grown in darkness, and with a little more speed than usual. For this purpose a garden-pot is inverted over the crown of an old sea-kail stock, in the winter before the leaves sprout. Over the pot is thrown a little litter, or some decaying leaves, or some old tan, so as to increase the temperature of the earth, and to exclude light; after a week or two the pot is examined from time to time, and when sprouts five or six inches long have been produced, they are cut off and fit for table.

Sea kail loves a light sandy soil, well drained in winter and richly manured. It will continue to bear cutting for twenty years together without suffering much; and is one of the most simple and useful of all culinary plants for a small garden. It is generally grown in rows eighteen inches or two feet apart.

CRA'MBUS, a genus of moths (*Lepidoptera Nocturna*) of the family Tineidæ (Stephens).

In crossing dry meadows during the summer time, we observe numerous little moths fly from the grass at every step we take; they soon settle again, and are then not easily detected, owing to their mode of folding their wings, which when shut almost inclose their slender bodies, and partly surround the blade of grass on which they rest; their form is then long and narrow, pointed at the head, and somewhat truncated at the opposite extremity. Their colouring is often brown and white, disposed on the upper wings principally in longitudinal lines. Very frequently, however, we find them adorned with beautiful metallic colours, generally of silvery or golden hues. Such are the insects which constitute the genus *Crambus*, and of which we possess about forty species in this country. The technical generic characters are:—Proboscis distinct; wings convoluted round the body when at rest; superior wings narrow; palpi long, the inferior the longer; head furnished with short closely-applied scales.

When the wings are expanded, these moths commonly measure about an inch in width; they are called in England the *Veneers*, and sometimes *grass-moths*.

CRAMER, **GABRIEL**, born, 1704, at Geneva; died, 1752, at Bagnols. He was professor of philosophy at Geneva, and author of a large number of works, for a list of which the 'Biogr. Univ.' refers to Sénebier, 'Hist. Litt. de Genève.' We have here only to mention him as the editor of the works of John and James Bernoulli, of the correspondence of the former with Leibnitz, and to notice his 'Analyse des Lignes Courbes Algébriques,' Geneva, 1750. This work is the largest collection of examples which exists, and is of permanent utility to elementary writers. So far as expressions entirely algebraical (as distinguished from transcendental) are concerned, it is a complete treatise on the elementary theory of curves.

CRAMP, a sudden, violent, and rigid contraction of a muscle, with pain, often intense. [SPASM.]

CRAMP, or **CRAMPERN**, is a piece of metal, usually iron, bent at each end and let into the upper surface of two pieces of stone when their perpendicular faces are joined together. Cramps are employed in the masonry of all solid structures. Copper, though more expensive, is better adapted for cramping, on account of its durability, than iron, as the iron, through oxidation, causes the stones to

split. The antients often used bronze cramps to bind their masonry together, as in the Colosseum. A great many of the cramps of this building have been cut out on account of the value of the metal. When a piece of stone is placed perpendicularly over another, without being connected with any other stone at the side, as in the Gothic pinnacle or in the shaft of a column, an upright piece of iron or copper is used, which is termed a plug. Cramps are cemented to the stone with lead; sometimes plaster, and even sulphur is used. In the fourth volume of Stewart's 'Athens' are some interesting details by Mr. Cockerell of the manner adopted by the Greeks in cramping the stones of the temple of the giants at Agrigentum. The Egyptians sometimes used wooden cramps.

CRANBERRY, the fruit of two species of *Oxycoccus*. The *English cranberry*, *Oxycoccus palustris*, is found wild abundantly in the fens of Norfolk, Lincolnshire, and many other parts of England, always by the side of little rills, and not among stagnant water; it has slender trailing thread-like shrubby shoots, clothed with tiny linear leaves, and has a five-parted pink corolla with the segments sharp-pointed and turned back. The fruit is a round austere red berry, which makes excellent tarts and one of the many kinds of marmalade. The Russian cranberries of the shops are borne by this species. They are not gathered till after the disappearance of winter. Near Petersburg the cranberry plant is so common, that the snow is stained crimson by the berries crushed to pieces by the passage of sledges over them. The *American cranberry*, *Oxycoccus macrocarpus*, is very like the other, but its leaves, flowers, and fruit, are larger; and the latter has a more medicinal taste. It is imported from the United States, in hogsheads, in considerable quantity, and used for the same purposes as the other; but it is considered of inferior quality.

Oxycoccus palustris has never yet been cultivated to any good purpose; chiefly owing to the difficulty of giving it a supply of running water. The *Oxycoccus macrocarpus* will grow readily and bear abundantly if planted in peat earth in a moderately damp and slightly shaded bed. It is however seldom so treated, the berries themselves being so cheap in the London market.

We believe that what in Scotland is called cranberry marmalade, is not prepared from the berries of the cranberry, but from those of the *Vaccinium Vitis Idæa*.

CRANBORNE. [DORSETSHIRE.]

CRANE. [GRUIDÆ.]

CRANGON. [CRUSTACEA. SHRIMP.]

CRA'NIA. [BRANCHIOPODA.]

CRANIOLOGY. [PHRENOLOGY.]

CRANMER, **THOMAS**, the second son of Thomas Cranmer and Agnes, daughter of Laurence Hatfield, his wife, was born at Aslacton, in Nottinghamshire, on the 2nd of July, 1489. The respectable family from which he descended had been settled in that county for some generations. His first instruction was received at a village school, from which he was removed by his mother, who had become a widow, and who placed him, in 1503, at Jesus College, Cambridge, where he became a fellow in 1510-11. He applied with great diligence to the studies of the University: Greek, Hebrew, and theology were the principal objects of his industry. Before he was twenty-three years old, Cranmer married a woman of humble station but respectable character, a kinswoman of the landlady of the Dolphin; and having in consequence forfeited his fellowship, accepted the appointment of lecturer in Buckingham, now called Magdalene College. The duration of this employment was very short; for in about a year after his marriage, his wife having died in childbed, by a somewhat irregular proceeding he was restored to his fellowship at Jesus. The agents of Wolsey, who had founded this celebrated college at Oxford, were now searching the kingdom for men of talent and learning to fill the vacant chairs in that establishment; and Cranmer was distinguished by them with the flattering offer of high and lucrative employment. After some hesitation, he refused the new dignities. In 1523 he took the degree of D.D. During his residence in the university, he had undertaken, in addition to his other duties, the charge of educating two sons of a Mr. Cressy, who was connected with him by marriage; and when the sweating sickness broke out in Cambridge (1528), retired to that gentleman's house at Waltham Abbey, where he was occupied with the instruction of his pupils and the prosecution of his studies. This change of residence influ-

enced the remainder of his life. By order of Henry VIII., six men of learning had been chosen from each university to discuss the validity of his marriage with his brother's widow, Catharine of Aragon, and Cranmer, among others, was selected; his absence from Cambridge, however, prevented him from giving his assistance to the delegates, who finally elected a substitute in his place. Either accidentally or by design, Gardiner and Fox (afterwards bishops of Winchester and Hereford) being in attendance upon the king, who was on a journey, met Cranmer at Mr. Cressy's table, and inquired anxiously the opinion of so distinguished a man upon the all-absorbing matrimonial question. He replied, that although he had not given much consideration to the question, he thought the course to be followed appeared to be sufficiently simple. The cause should be determined by reference to the Bible—should be settled by divines, the most proper persons to determine it, and by those of the English universities, who were as well fitted to entertain it as those of Rome or any foreign country. The report of this judgment, which was not wholly new, gave great satisfaction to the king, who immediately sent a messenger to require his attendance at the palace. Unwilling to forsake a life of study and retirement, Cranmer endeavoured to excuse himself from attending at court. His excuses, however, did not avail; and the reluctant adviser having been graciously received, was commanded to reduce his opinion to writing, and consigned to the hospitality of Lord Wiltshire, the father of Anne Boleyn. The opinion was soon written. It asserted that the marriage of Henry with his brother's widow was condemned by the authority of the Scriptures, the councils, and the fathers; and that the pope had no power to give a dispensation for that which was contrary to the word of God. Cranmer having professed his willingness to maintain these positions in the presence of the pope, was acquainted with the king's intention immediately to send him to Rome. Pains were taken to make this judgment known. Cranmer himself disputed upon it at Cambridge, and brought several over to his opinion. He then returned to his attendance upon the court; and having been appointed chaplain to the king, and presented to a benefice and the archdeaconry of Taunton, joined the others who were associated with him in the embassy, and travelled to Rome about the close of 1529.

The ambassadors, finding all arguments unavailing to persuade Clement to favour the divorce, quickly returned to England. Cranmer alone remained in Italy. At length even his patience was exhausted by continued refusals to allow him to maintain in public the judgments of the English and foreign universities, which were for the most part favourable to the king's cause. The pope conferred on him, for the sake of conciliation, the empty title of 'Supreme Penitentiary,' and soon afterwards gladly saw him turn his back upon Italy (1530). In prosecution of the same business, Cranmer now went to France, and also to the emperor of Germany—an expedition which, although it produced no decisive public result, led to an event of great private consequence to himself. Regardless of the Romish injunction for clerical celibacy, during this residence abroad he married (1532) a second time; the object of his choice was the niece of his friend Osiander, the pastor of Nuremberg. This imprudent act, which he could not avow, exposed him eventually to many unworthy evasions. It was not long after they were united, before Cranmer received news of Archbishop Warham's death (August, 1532), and of Henry's intention to raise him to the see of Canterbury. He suffered four months to elapse, in the hope that the king might change his mind, and then unwillingly accepted this promotion, which the necessary oaths respecting celibacy and obedience to the pope rendered unacceptable: he was consecrated on the 30th of March, 1533, making a public protestation, at the time when he swore submission to the pope, 'That he did not intend by this oath to restrain himself from anything that he was bound to either by his duty to God, or the king, or the country.' 'By this,' says Burnet (*Hist. Reformation*, vol. i.), 'if he did not wholly save his integrity, yet it was plain he intended no cheat, but to act fairly and above-board.' Afraid of a rupture with England, the pope accepted less than the usual fee.

Cranmer, soon after his appointment, discussed the king's cause in convocation; and having travelled to Dunstable, to which town the commission adjourned in order to be near Queen Catharine's residence at Ampthill, he there (23

May, 1533) declared the marriage null and void. Five days afterwards he publicly married the king to Anne Boleyn, a private marriage having taken place in the January previous. He also officiated at their coronation on the 1st of June, and stood sponsor to the Princess Elizabeth, who was born in the following September. The business of his office and parliamentary duty now occupied his time. With his assistance were passed several statutes, by which the power of the pope in England was materially diminished; the convocation and universities assented to these statutes, pronouncing that 'the bishop of Rome has not any greater jurisdiction conferred on him in this realm of England than any other foreign bishop.'

In 1534, when Sir Thomas More and Fisher, bishop of Rochester, refused the oath of supremacy, Cranmer's best endeavours were used in vain, first to overcome the scruples of the recusants, and afterwards to dissuade the king from executing the sentence that had been pronounced upon them. In this year, with the consent of the convocation, he set on foot a translation of the Bible, by dividing Tindal's version of the New Testament into nine or ten parts, which he required the most learned bishops to revise; the translation was completed and ultimately printed at Paris. In 1535 Cranmer assisted in the correction of a second edition of the King's Primer, a book containing doctrines bordering upon Protestantism, of which it has been asserted that the archbishop was originally the compiler. His continual study of the bible, and the notes that he had collected upon all heads of religion, both from places in scriptures, and ancient fathers and doctors, fitted him most fully for the undertaking. In August he wrote a curious letter (Strype) to the king, respecting the publication of his supremacy by the clergy, and urged him to the suppression of the monasteries, which he considered inconsistent with true and full reformation. Cromwell was now raised by the king to be head of his ecclesiastical affairs, under the title of Vicar-general, and Cranmer consecrated Latimer and Shaxton to the sees of Worcester and Salisbury. In 1536 died Catharine the divorced queen; and Henry being now tired and jealous of Anne Boleyn, soon got rid of her. Cranmer was forbidden the court, lest his presence might impede the proceedings against the queen, from whom he received uniform kindness. In virtue of his office he pronounced her marriage void (1536), and on the day after her execution the king was united to Jane Seymour. In June the archbishop opened the convocation, where Cromwell presided as Vicar-general; the record of the late queen's divorce was sanctioned without the opposition of Cranmer or any other member. After much violent and useless discussion, the synod proceeded to debate upon the sacraments. Cranmer spoke at considerable length, and articles were afterwards framed by him, and others of the 'new learning,' as the doctrines of the reformers were then called, by which considerable innovations were effected. The pope, who was watchful of the proceedings of England, threatened to assemble a synod, for the sake of passing censures upon Henry; in anticipation of which, Cranmer and others signed a declaration that the king need not obey their decisions, in case such an assembly was convened. With the assistance of many eminent divines, Cranmer arranged a compilation called the Bishops' Book, inculcating the doctrines of the Reformers as expressed in the articles of the preceding year. The king, to whom this book was submitted, himself inserted some corrections, from which the archbishop was bold enough to dissent. However ill Henry's temper might have brooked such contradiction from another, he bore it patiently from the archbishop, who had been his most useful friend, and we find that in the October of this year, when the queen gave birth to Prince Edward, the primate and the duke of Norfolk stood sponsors at his baptism.

The destruction of the greater abbeys was now rapidly proceeding; and the funds which arose from them were lavished by Henry upon unworthy favourites, until Cranmer, who had hoped to apply them to the promotion of religion and education, remonstrated against their improper application. A sum of money was obtained for the foundation of some new bishoprics, but the king's prodigality could be checked no further. In the autumn of 1538 the primate came to London to meet an embassy of German Protestant divines, for whom he strove to procure a conference with the English ecclesiastics. To the great disappointment both of the ambassadors and the reformers, the

king opposed their wishes, and directed Tonsal, a bishop opposed to the 'New Learning,' to draw up an answer to the dissertation which had been compiled by the German divines.

On the 5th of May, 1538, Cranmer and others were appointed commissioners 'to inquire (Le Bas, vol. i. 204) into the debated doctrines, and to prepare such articles as would pacify the spirit of controversy.' At the end of eleven days, the labours of the commissioners coming to no result, the duke of Norfolk offered six articles (Burnet, vol. i.) for the consideration of the House of Lords. Cranmer's opinion agreed only with one of these articles. Being desired by the king to explain himself in writing, he composed a treatise upon the case, which, with his secretary, to whom it was intrusted, became the subject of a singular adventure. (Burnet, vol. i.) In parliament, he argued for three days with considerable learning and eloquence, until the king, who favoured the articles, angrily desired him not to appear again in that house before they had become law. Cranmer, obedient to Henry in most points, in this respectfully resisted the king's commands: but although he continued present, he was unable either to throw out the duke of Norfolk's measure, or to alter the sanguinary penalties which it contained. As soon as this act was passed, Latimer and Shaxton resigned their bishoprics, an example which, contrary to expectation, the archbishop did not think it his duty to follow. He retained his see, and lived in retirement with his wife, who however was soon compelled to retreat to Germany.

In July, 1540, the primate presided at the convocation which pronounced the unjustifiable sentence of dissolution of the marriage which had been solemnized between Henry and Anne of Cleves. This ridiculous ceremony was quickly followed by the execution of Cromwell.

The misconduct of Catherine Howard, whom Henry had married as soon as he had put away his former queen, coming to the knowledge of the archbishop, he undertook to report her profligacy to the king (1541). After an investigation, the proofs of her crimes were held to be conclusive; she was condemned, and, after a delay of some weeks, during which time Henry, through a message, of which Cranmer was the bearer, promised to spare her life, she was executed.

The maintenance of the ground that the Reformation had gained, and the extension of it where it was possible, now (1542) became the sole occupation of Cranmer, who had transferred to the universities the task of revising a new edition of the Bible published the year before, which it had been proposed to apportion among the bishops, requiring an English version of such part from each, whatever might be his opinions. This was considered a step gained, as it certainly was the preferable method: and notwithstanding the Reformers did not in all things prevail (for a prohibition against Tindal's Bible was secured by their opponents), they had still further success in procuring an order that the scriptures should be read in English by the ministers in the church service. In a minor degree Cranmer's attention was occupied in reproofing the excess of luxury in which some ecclesiastical establishments as well as the bishops had indulged.

In May (1543) appeared the King's Book, which was in fact little more than a new edition of the *Institution*, altered in some points by the papal party: it received its name from the preface, which was written in Henry's name. The clergy being hostile to this book, Cranmer, at a visitation of his diocese, in submission to the king's supremacy, forbade them from preaching against any portions of it, however they or he himself might dissent from them. The exertions which he had used for the correction of his diocese, in which religious variance was at a great height, were watched and examined by his political adversaries, who hoped to found on them such accusations as would ensure his ruin. The prebendaries of Canterbury and some magistrates in Kent, encouraged by Gardiner, after holding a succession of meetings, finally drew up articles accusing Cranmer of abusing his power. These charges were submitted by the prebendaries to the council, and by the council to the king. Henry immediately caused the accusation to be sifted by a commission, who declared them to be unfounded, and the authors of the conspiracy afterwards submitted themselves to Cranmer, who refrained from bringing them to punishment.

In 1544 Cranmer successfully exerted himself in parlia-

ment to carry a bill to mitigate the severity of the statute of the Six Articles. He also assisted in compiling an improved English Litany, essentially similar to that which is now in use. Difficulties however were increasing around him, and he had the dissatisfaction of seeing the seals, which were now resigned by Lord Audley, his personal and political friend, conferred upon Lord Wriothesley, an adherent of the Roman Catholic party. By this appointment, as well as by the death of the duke of Suffolk, it was expected that the king's favour towards the Reformers might be weakened. Nor indeed was it long after Suffolk was in his grave before Cranmer, who, with three others, had been associated with the queen in the government of England during Henry's temporary absence in France, had reason to feel his loss. The duke of Norfolk and other members of the privy council accused him of spreading heresies through the land, and prayed the king, that, for the safety of his dominions, the archbishop might immediately be committed to the Tower. Henry, on the same night that the accusation was received, caused Sir Anthony Denny to carry a message to Cranmer, who rose from his bed to attend upon the king at Whitehall. The council assembled on the following morning, and summoned before them the primate, who had been insultingly kept for an hour in a servant's waiting-room. At length sentence of imprisonment was passed upon him, but, to their surprise and confusion, he produced the signet of the king, from whose hands he had received it the night before. The council did not venture to proceed any farther in the case.

After a peace had been concluded with France (1546), Anhalt, the French admiral, came to England. A resolution was made by him, and sanctioned by the king, that the Reformation should be proceeded with, and that in both countries the mass should be changed into a communion, the form of which Cranmer was ordered forthwith to draw up. This was the last year of Henry's reign.

The king, who of late had grown so corpulent and unwieldy that he was raised up and let down the stairs by a machine, after an illness of some weeks, sank under his disease on the 27th of January, 1547. Cranmer was named one of the executors of his will, and one of the regents of the kingdom.

On the accession of Edward, who had not yet completed his tenth year, and, the better to establish his supremacy, the bishops received anew their bishoprics at his hands. The first public act of the primate was the coronation of the new king (February 20, 1547), and the delivery of a short address which he then substituted for the customary sermon. No one that heard the expressions of the archbishop could hope for the restoration of papal supremacy; all things indeed betokened a still further extension of the Reformation. An inquiry into the state of religion, by means of a visitation of the whole kingdom, was immediately set on foot: twelve homilies, four of which are ascribed to Cranmer, were drawn up, and ordered to be placed in every church, with the translation of Erasmus's paraphrase of the New Testament, for the instruction of the people. It is true that these measures, though they had many supporters, met with frequent opposition. Gardiner continued to argue, both in person and in writing, against the homilies and the paraphrase, which the bishop of London also proclaimed to be heretical. Nevertheless Cranmer's influence prevailed: and when he produced, in convocation, an ordinance that the laity as well as the clergy should receive the sacrament in both kinds, the proposition passed *unanimously*, and soon after obtained the sanction of the legislature. By the same parliament the Act of the Six Articles and other severe statutes were repealed.

During this winter session of parliament it was proposed to confer upon the king such chapels, chantries, and colleges as had escaped his father's grasp. There were few subjects upon which Cranmer's opinion coincided with that of the Roman Catholic party, but in this case he joined their ranks, and voted in opposition to the bill. He now (1548) revived the proposal for substituting a communion office for the mass, and a service was framed in time to be circulated to the clergy for their use at the following Easter.

The more considerable labours which occupied the Protestants at this time still remain to be told. An English translation of a catechism which had been written in German and in Latin by one Justin Jonas, was published by the archbishop, entitled 'Cranmer's Catechism.' In the month of May a commission of twelve divines, with Cran-

mer at their head, was appointed for the compilation of an English liturgy. Nor were these the only additions to the ordinary duties of the primate; he took charge of a bill, which was passed, permitting marriage among the clergy. By the end of November the Prayer-book was finished, and on the 15th of January, 1549, legal sanction was given to it. Great opposition was made to these changes in different parts of England, in Wiltshire, Somerset, Norfolk, and especially in the west, where at the instigation of their religious teachers the people took such weapons as they could procure, and mustered in considerable force. The legislature, anxious to quell this disturbance, desired Cranmer to draw up an answer to fifteen articles of remonstrance which had been framed by the insurgents. A very masterly reply (Strype's Cranmer, Appendix 40) was written, but not completed, before the leaders of the insurrection were apprehended and executed, and the rebels had dispersed. It would have been more to the honour of the archbishop if the spirit that pervaded his reply had been carried into a commission, at which he presided, for the suppression of certain heresies, for he would then have escaped the stain of having condemned two persons to the stake; but however amiable and forbearing was his general disposition, no excuse can be offered for him or for his friends Ridley and Goodrich, who, with others, were implicated in this affair. Upon the condemnation of Lord Seymour (1549), Cranmer signed the warrant for his execution, notwithstanding the canon law set forth that no churchman should meddle in matters of blood. Whatever may have been the primate's conduct towards Seymour, towards his brother the Protector Somerset it was unexceptionable: from the time that his distresses commenced till his execution was effected by the enemies whom the weakness of his character and elevated station had created, he retained Cranmer's firm and invariable friendship. Bonner, the bishop of London, was now degraded by commissioners, of whom Cranmer was one. When this commission was dissolved, an ordinance was signed by the primate, the chancellor, and four others of the council, for the abolition of Roman Catholic books of devotion: an addition was also made at this time to the ritual that had been substituted for them, in the shape of a formulary for ordination: and other steps were taken by the primate in order to diffuse a better knowledge of the creed of the Protestants. At Lambeth he received the most eminent foreign divines, Martin Bucer, Fagius, Peter Martyr, with several more.

Cranmer was greatly troubled at the discussions of the clergy respecting the removal of altars from the churches and the placing of communion tables in their stead. This had been done (1550) partly at the recommendation of Hooper, a divine who had been driven from England by the act of the Six Articles, and who, during his residence abroad, had adopted very scrupulous opinions. In July, Hooper was made bishop of Gloucester: and soon after Cranmer received from him a refusal to wear the usual episcopal habits. This question, upon which the primate himself seems sometimes to have hesitated, was now brought to an issue. If a dignitary of the church had been suffered to discontinue the vestments of his order, such was the state of the lower clergy that they would immediately have obeyed the signal and relinquished the surplice and the gown. Cranmer, upon consideration, determined to oppose Hooper's intentions, and in case of an obstinate adherence to his scruples, to remove him from his bishopric: a compromise eventually followed, and he adopted some of the usual habits.

The bishop of Chichester would not obey the order respecting the removal of altars, and the primate consequently deprived him of his see. The case of bishop Gardiner, who had now been in prison nearly two years, was also proceeded in. Articles were sent to him touching the king's supremacy—the full obedience owed to him notwithstanding his youth—that he had power to correct what was amiss in the church, &c.; and these, with some exceptions, he signed. Other articles were then framed, treating of the marriage of the clergy, the suppression of masses and images, the new book of service, &c.; to these he refused to put his name, upon which the commission, consisting of the primate, Bishop Ridley, who had succeeded Bonner in London, and six others, eventually deprived him of his bishopric and sent him back to the Tower. The conduct of Cranmer in the cases of Bonner and Gardiner was a great exception to his usual moderation. Gardiner, during his imprisonment,

occupied himself in answering a treatise published by Cranmer, entitled the 'Defence of the True Doctrine of the Sacrament.' This controversy was carried on by the archbishop until the end of his life. The subject of it was one which had greatly occupied the mind of his friend, bishop Ridley, as well as his own; he had more than once changed his opinions, which at length became fixed according to the doctrine maintained in his treatise. (Jenkyne's *Remains of Cranmer*.) His arguments with Gardiner and Smythe, his chief opponents, show considerable skill and learning.

At the close of this year a revision of the Service-book of 1548 was commenced by him, with the assistance chiefly of Ridley and Cox, who, with Peter Martyr and Bucer, stated objections and recommendations in writing. The undertaking was checked in 1551, by the lamented death of Bucer, who (Burnet says) was, 'by order of Cranmer and Sir John Cheek, buried with the highest solemnities that could be devised.' The bishops being now (1551) for the most part divines favourable to the Reformation, the compilation of articles for the greater uniformity of faith was undertaken by them at the suggestion of the king. This additional labour so filled the hands of Cranmer, that his time was nearly always occupied by one or other of the great duties that he had imposed upon himself: scarcely could he be spared to attend at the trial of Bishop Tonsal, a man of moderation and learning, against whom accusations were brought forward in December. The bishop was deprived of his see, a sentence which was so contrary to Cranmer's wishes and opinion, that, together with Lord Stourton, a Roman Catholic, he entered his protest against it. It was not till this year (1552) that Cranmer gave up all hope of effecting an agreement in religious doctrines among all the churches that had withdrawn from the Papal supremacy. He was greatly disappointed at the failure of a scheme in which he had always been sanguine of success. The Reformers had now to lament the declining health of the king, but they did not relax their exertions in the cause of religion, for the Service-book was finally completed and the Book of Common Prayer adopted by parliament in the spring of 1552. A project for the reformation of the ecclesiastical courts was revived, and soon completed under the superintendence of the archbishop: only the king's signature was required for its validity. In May, 1553, Edward issued a mandate that the clergy should subscribe to the Forty-two Articles upon which the divines had agreed; but he died soon afterwards without authorizing the new ecclesiastical code, which it scarcely need be said was never afterwards adopted.

No sooner was Edward dead than Lady Jane Grey was proclaimed queen: and a letter was sent to the Princess Mary declaring Queen Jane to be the sovereign. This letter was signed by many of the principal persons in the state, and among others by Cranmer. His zeal for the Protestant cause must have blinded him to the danger of an enterprise directly contrary to the resolution he had formed upon first hearing of the project. On the 9th of July, 1553, the chief officers of state swore allegiance to Jane: on the 20th we find many of those who had been zealous in her cause, 'impatient to send in their submissions to Mary.' On the same day an order was sent by Mary to Northumberland to disarm, which paper, strange to say, was signed by Cranmer. The hopes of the Protestants were now at an end; Queen Mary's unshaken attachment to the Roman Catholic creed was universally known; Gardiner was released and made chancellor, and power of appointing preachers given to him instead of to the primate: a commission was also granted to the bishops of London, Winchester, Chichester, and Durham, to degrade and imprison Protestant prelates and ministers on the charges of treason, heresy, and matrimony.

Cranmer's friends recommended his immediate flight; but in consideration of the high office that he held, he rejected their advice. In the beginning of August he was summoned before the council, and ordered to confine himself to his palace: on the 27th he was again brought before the same tribunal; and in September, together with Latimer and Ridley, was committed to the Tower. During his confinement to the palace, in refutation of some reports that the primate would come over to the Roman Catholics, he wrote a declaration against the mass. This was not published, but by some means, respecting which there is a difference of opinion (Todd, vol. ii.; Burnet, vol. ii.), copies were obtained of it, which reached the council, and were

openly read in Cheapside. In the Star-chamber Cranmer avowed the writing, and his intention of affixing it to every church-door in London. The council committed him not only for treason against the succession of the queen, but for perseverance in 'disquieting the state.' The queen did not oppose the committal.

In March, 1554, Cranmer was removed, in company with his fellow-prisoners, to the prison of Bocardo at Oxford, where was renewed the controversy respecting the Lord's Supper, which, by the queen's desire, was named the subject for discussion.

On the 13th of April, the persons sent by the convocation to dispute appeared in the university, and Cranmer, who was first called before them, after examining the questions set before him (Burnet, vol. ii.), entered into argument upon them. After him reasoned Latimer and Ridley, amidst much shouting, hissing, confusion, and insult, so that the assembly, says Burnet, 'looked liker a stage than a school of divines.' On the 19th the discussion was revived; and on the 28th they were again brought to St. Mary's, where it was declared, that unless they would turn, they were obstinate heretics, and no longer members of the church. Cranmer then replied, 'From this your judgment and sentence I appeal to the just judgment of the Almighty, trusting to be present with Him in Heaven, for whose presence in the altar I am thus condemned:' and having thus spoken he was removed again to his prison.

He had some days before sent a petition to the council and the queen, praying pardon for his offences towards her, but the bearer to whom he had intrusted the papers broke them open, and it is not known that they reached their destination. However this may be, the council decreed that the charge of treason should be withdrawn, and the proceedings for heresy followed up, that the pains of fire, and not the axe, might be the manner of his death.

It was now discovered that the tribunal before which Cranmer had been tried was not competent to decide the case, and that the sentence was illegal. The pope therefore issued a fresh commission, and on the 12th September, 1555, the primate was again examined by Brokes, the bishop of Gloucester, and two civilians, Martin and Story. After some discussion, sixteen articles of accusation were produced, touching which eight witnesses were examined, and then the case closed. It is remarkable that, previous to these proceedings, Cranmer was summoned to appear within eighty days before the pope at Rome: this must have been a mere fiction of papal law, not intended for him to obey, as indeed it was impossible for any prisoner to do. Not long after Cranmer was sent back to prison, he heard of the execution of Ridley and Latimer, and after a few more weeks had passed, he received from Cardinal Pole an answer to two letters that he had written to the queen during the interval between the last proceedings at Oxford and the day that these bishops were brought to the stake. It appears from these letters that the primate's adherence to Protestant principles was still unshaken. On the 29th of November the eighty days had elapsed, and on the 4th of December he was excommunicated and deprived of his bishopric. A letter from the pope (Paul IV.), bearing date the 14th of November, affirming him to be contumacious, because 'he took no care to appear' at Rome when cited, and declaring him guilty of heresy and other enormities, finally commanded his execution. On the 14th of February, in obedience to this mandate, Cranmer was degraded. It was within a few days after this that the fortitude of a mind which had hitherto been firm gave way under the pressure of misery and the close prospect of a torturing death. The love of life overcame his firmness: he forsook his principles, and wrote a recantation of his faith. By whose exertions his resolution was shaken we cannot ascertain; but this unworthy sacrifice of opinion served only to render his enemies triumphant: whatever had been their promises, the recantation was of no avail towards the preservation of his life. On the 20th of March, the eve of his execution, he was visited by Dr. Cole, the provost of Eton College, who had been ordered by the queen to attend him. During this interview Cranmer gave answer that he remained firm in the Catholic faith as he had recently professed it, an answer that has by some been considered equivocal. After Cole had left him, Garcina entered the prison, and requested him to transcribe a recantation, to be delivered by him at the stake, which the prisoner consented to do. On the following day he was led to St. Mary's church,

where, after an exhortation had been read by Dr. Cole, and Cranmer had finished his private devotions, he solemnly addressed the people, openly professing his faith, and at length declaring, 'Now I come to the great thing that troubleth my conscience more than any other thing that I ever said or did in my life; and that is the setting abroad of writings contrary to the truth which I thought in my heart, and writ for fear of death, and to save my life, if it might be; and that is all such bills which I have written or signed with mine own hand since my degradation, wherein I have written many things untrue. And forasmuch as my hand offended in writing contrary to my heart, therefore my hand shall first be punished. For if I may come to the fire, it shall be first burned. And as for the pope, I refuse him, as Christ's enemy, and antichrist, with all his false doctrine.' The whole assembly was astonished at this speech: they had supposed that he would have confirmed and not retracted his recantation. He was then hurried away to the stake, where he stood motionless, holding up his right hand, and exclaiming, until his utterance was stifled, 'This unworthy hand! Lord Jesus receive my spirit!'

Cranmer's diligence and application were unusual: he was deeply read in theology and canon law, and was familiar with Hebrew, Greek, and Latin, as well as French, German, and Italian, which he acquired during his travels: the copiousness of his common-place books gave weight to his opinion, and readiness to his power of argument. His reservation respecting the oaths which he swore when appointed archbishop, his subserviency to Henry VIII. in annulling his marriages, his share in the condemnation of some heretics, his conduct at the disgracing of Bonner and Gardiner, and the want of courage which made him recant after his condemnation, are great blots on his character. But though his conduct on these occasions was marked by dishonesty, intemperance, and want of firmness, these were rather impulses than habitual and characteristic vices, for it cannot be denied that Cranmer was sincere, mild, and moderate, and for the most part a firm man: nor is it to be forgotten that persecution was the policy of all religious parties at this period. He had moreover the virtue of constancy to his friends, a very rare quality in the times in which he lived; and never relaxed his friendship towards Anne Boleyn, Cromwell, or Somerset in their adversity. The affability of his manners, and the gentleness of his temper, made him beloved by many friends and men of learning, to whom he also extended a liberal hospitality; so that his protracted imprisonment and cruel death was one of the most unpopular measures of Mary's government. A complete collection of the extant works of Cranmer has been published at Oxford by Dr. Jenkyns.

(*Strype's Memorials of Cranmer*; *Fox's Acts and Mon.*; *Burnet's Hist. Reform.*; *Gilpin's, Todd's, and Le Bas's Lives of Cranmer*; and the general histories of the period.)

CRAPE is a light transparent fabric composed of silk, from which, by the mode of its preparation, all the gloss has been taken, and which, when dyed, as it usually is, of a black colour, is worn as the sign of mourning for the dead.

The weaving of crape is conducted according to the simplest method of the weaver's art, all its peculiarity being given to it in the dressing, which it receives after it is taken from the loom. The silk is used without its having been washed or dyed, and consequently with all the natural viscid gum which forms a part of its composition as spun by the worm. For thin crape, the only preparation which the filaments undergo previous to the weaving is the simple twisting, which forms the first process of the throwing mill, and in which state the thread is technically called *singles*. When it is intended to make a more substantial fabric, the warp is made of two and sometimes three filaments twisted together, which in that state are called *tram*: the weft is still composed of singles. After the web is taken from the loom, it is dressed with a viscid solution of gum, which in drying causes the individual threads to resume, as far as the interlacing will admit, the form they originally held previous to their being twisted in the throwing mill, and thus is produced the peculiar wrinkled appearance by which crape is distinguished. This fact will be shown if a piece of crape is washed in water hot enough to discharge the gum, when the web will resemble thin gauze.

CRASHAW, RICHARD, an English poet, the son of the Rev. William Crashaw, a divine of some note in his

day, was born at London, but in what year is uncertain. In early life he was placed, through the kindness of Sir Henry Yelverton and Sir Randolph Crew, upon the foundation at the Charterhouse, whence, in March, 1632, he went to Pembroke Hall in Cambridge, and took the degree of B.A. in 1634. He afterwards went to Peterhouse, of which he was a fellow in 1637, and became M.A. in 1638.

In 1634 he published a volume of Latin poems, mostly devotional, in which the celebrated line is found upon the miracle at Cana in Galilee, which has been ascribed to other and greater poets than Crashaw:

'Nympha pudica Deum vidit, et erubuit.'

'The modest water saw its God, and blushed.'

A second edition of his 'Poemata and Epigrammata' was published at Cambridge, 8vo., 1670.

At what time Crashaw was admitted into holy orders is uncertain. Wood says he took degrees at Oxford in 1641; about which time he seems to have become a popular preacher, full of energy and enthusiasm. His degrees, however, do not appear in the public register. In 1644, when the parliamentary army expelled those members of that university who refused to take the covenant, Crashaw was among the number; and being unable to contemplate with resignation or indifference the ruins of the church establishment, he went over to France, where his sufferings and their peculiar influence on his mind prepared him to embrace the Roman Catholic religion. In 1646 the poet Cowley found Crashaw in France in great distress, and introduced him to the patronage of Charles the First's queen, who gave him letters of recommendation to Italy: there he became secretary to one of the cardinals at Rome, and was made a canon in the church of Loretto, where he died of a fever, soon after his promotion, about the year 1650. His 'Steps to the Temple, Sacred Poems, with other Delights of the Muses,' was published in 12mo., 1646; a second edition, 1648; and a third, also called second in the title, 8vo., 1670. Pope occasionally borrowed thoughts from Crashaw, but improved them. Crashaw resembled Herbert in his turn of mind, but possessed more fancy and genius. (See the new edit. of the *Biogr. Britannica*; Chalmers's *Biogr. Dictionary*, vol. x., p. 482-485; Wood, *Fasti Oxon.*, Bliss's edit., vol. iv., p. 4; Ellis's *Specimens of the early English Poets*, vol. iii., p. 224.) In 1652 a posthumous volume of his Poems was published at Paris, accompanied with vignettes by Messenger, entitled 'Carmen Deo nostro, te decet Hymnus—Sacred Poems, collected, corrected, augmented, most humbly presented to my Lady the Countesse of Denbigh, by her most devoted servant R. C., in hearty acknowledgement of his immortall obligation to her goodness and charity,' 8vo. An edition of his English Poems, selected from the two volumes, was published by Peregrine Phillips, 12mo., London, 1785.

CRASSATELLA. [CONCHACEA.]

CRA'SSINA. [VENERIDÆ.]

CRASSULA/CEÆ, a natural order of Polypetalous Exogens, forming by itself the Crassal alliance of the Apocarpous group. It consists of succulent plants, with herbaceous or shrubby, and annual or perennial roots, growing in hot dry exposed places in the more temperate parts of the old world chiefly. On the sun-scorched cliffs and volcanic soil of the Canaries, and on the dry sterile plains of the Cape of Good Hope, they are most abundant. Their flowers are arranged in panicles, spikes, cymes, and corymbs; each has a calyx of several divisions, alternating with which is the like number of petals, alternating with which is the like number of stamens, or twice as many, alternating with which are as many distinct carpels as there are segments of the calyx. The stamens arise from the tube of the calyx; there is usually an hypogynous gland at the base of each carpel; the carpels are often of the same colour as the petals; and sometimes in monstrous cases the anthers bear ovules as well as the ovaries. The fruit consists of a number of distinct follicles, each containing numerous minute seeds; the embryo lies in the axis of fleshy albumen.

Many species of *Crassula*, *Rochea*, *Sempervivum*, *Sedum*, &c., are cultivated for the beauty of their flowers; the various annual *Tillæas*, &c., are obscure weeds; house-leeks (different sorts of *Sempervivum*) are grown for their refrigerant qualities; and the leaves of *Sempervivum arbo-reum* possess powerful tanning qualities.

All the hardy species may be grown on old walls, roofs, rock-work, or other places thoroughly drained of moisture;

the greenhouse kinds require what is called a dry stove treatment, that is, they must be potted in a mixture of lime rubbish, broken pots and earth; in summer they are freely exposed to the weather in sunny situations without protection, and in winter they are kept moderately cool, and nearly without water.

[Crassulaceæ.]

A. a portion of a branch of *Sempervivum villosum*. 1, a calyx of *S. montanum*; 2, a part of the petals and stamens laid open, and adhering by the tube of the calyx; 3, a calyx with the ovaries projecting—the hypogynous scales are seen at the base of some of these; 4, a ripe follicle; 5, a section of a seed showing the embryo in the albumen.

CRASSUS, the surname of several Roman families, and especially of the triumvir Marcus Licinius. When he is first mentioned in history, he is spoken of as exceedingly rich; and it was partly owing to this circumstance that he was appointed to take the command against the revolted gladiators of Capua. In a few days he raised an army of six legions, and marched in quest of the enemy. A battle was fought in the south of Italy, near Rhegium, in which Crassus was completely victorious, and Spartacus fell with 40,000 of his men. Crassus was rewarded with an ovation on his return; but instead of the usual myrtle-wreath, he had a laurel crown. (Aul. Gellius, v. 6.) At the time of his expedition against Spartacus, he held the office of prætor; and the following year (A.U.C. 683, 71 B.C.), he was chosen consul with Pompey. The influence which Pompey gained by his popular and engaging manners Crassus succeeded in acquiring by the hospitality and munificence which his immense wealth easily supported. On one occasion he gave a general entertainment to the whole people, and distributed corn enough for three months' provision. No acts of importance, however, are recorded by historians during this administration. After some years, Crassus and Pompey dropped that determined violence towards each other, which, though frequently concealed, had never been wholly removed, and joined Cæsar in what is called the first triumvirate. While the actual power was almost entirely engrossed by Cæsar, he endeavoured to blind Crassus and Pompey to the real state of things by certain concessions which he made. With this view he included them both in a commission for dividing the lands of Campania, and for settling a colony at Capua, and thus enabled them to provide for some needy adherents to their interests. After a time the alliance was discontinued, but

it was renewed again; and in B.C. 56 Pompey and Crassus offered themselves as candidates for the consulship, in order to keep out Domitius Ahenobarbus, who was violently opposed to Cæsar, and would be likely to thwart his designs. Cæsar had been appointed over the province of Gaul for five years; and Crassus and Pompey, though for some time they concealed their intentions, at last succeeded in gaining the provinces of Syria and Spain for the same period and on the same terms. Pompey did not leave immediately for Spain; but Crassus set out for Syria without delay, even before the year of his consulate was expired, B.C. 55. From the great preparations which he made, both in raising forces and in other ways, and from his known avarice, it was clear that a war with the Parthians was the real object at which he aimed; and the joy which he displayed at the prospect of so vast an increase of his wealth Appian (*on the Parthian Wars*, § 135) describes as perfectly childish and ridiculous. The tribune Ateius endeavoured to prevent Crassus from going on this expedition, but in vain; and as Crassus was passing through the gates of Rome, the tribune pronounced certain terrible imprecations upon him over a small fire, which had been lighted according to the usual practice in such cases. A person thus devoted, it was believed, could not possibly escape, and the person who so devoted another could not prosper himself, and therefore it was a course not pursued hastily or on light grounds. (Appian, § 137; Cicero *de Divinatione*, i. 16.) This consideration increased the alarm which the curse produced in the people, and even among the army of Crassus himself. Nevertheless he proceeded, by way of Macedonia and the Hellespont, to Asia. He crossed the Euphrates and ravaged Mesopotamia without resistance. Orodes, the king of Parthia, being at the time engaged in an invasion of Armenia, his general Surena commanded the Parthian forces against the Romans. A battle was fought near Carrhæ between Crassus and Surena, in which Crassus was defeated. The clamours of his soldiers obliged him to accept proposals of peace from Surena, to whom the messengers of the Parthian general promised to lead him. His resistance to their insulting treatment provoked their fury, and they put him to death without delay, B.C. 53. Surena had his head and right hand cut off and sent to Orodes.

We have no proof that Crassus possessed very great talent of any kind, and, but for his wealth, he would probably have been scarcely known. From his father he inherited a large fortune; but the rest of his wealth was not acquired by the most honourable means. He is said to have enriched himself by purchasing at a very low price the estates of those who were proscribed by Sylla; also by letting for hire slaves, whom he had instructed in various arts and trades; and so high was his own standard of opulence, that he said no one could be rich who was not able to maintain an army at his own expense. With all his avarice he was generally ready to lend money to his friends, and was hospitable without extravagance. Cicero (*Brut.*, § 66) represents him as a man of moderate acquirements and slender abilities, but of great industry and perseverance. In another of his works (*Tusc. Quæst.*, v. 40) he says, 'Crassus was somewhat deaf, but a greater misfortune than this was the bad character which people gave him, though in my opinion unjustly.' (Cicero, *Epist. ad Atticum*, i., 14, 17; iv., 13; Appian, *on the Parthian Wars*, § 134-155; Dion Cassius, xxxvi. & xxxvii.; Plutarch, *Life of Crassus*.)

[Coin of Crassus.]

British Museum. Actual Size. Silver. 61½ grains.

CRASSUS, LUCIUS LICINIUS, was considered the greatest orator of his time. He appears to have superintended the course of Cicero's early education. (*De Oratore*, ii., 1.) Cicero, in one place (*Brut.*, § 38), pronounces him perfect, and in the treatise before referred to (*De Oratore*) he delivers his own sentiments on eloquence in the person of Crassus. In the beginning of the third

book he takes occasion to lament the death of the interlocutors in the dialogue, Crassus and Antonius.

CRATÆGUS, an extensive genus of hardy trees and bushes, the different species of which are cultivated for the sake of their ornamental appearance, especially when loaded with brightly-coloured fruit. It belongs to the pomeous division of the rosaceous order, and is very nearly allied to the apple, from which it differs in the fruit containing a variable number of stones, as the medlar does; from the medlar it is known by its fruit being closed, not spread open, at the apex.

The species inhabit woods and hedges throughout the northern hemisphere, from Barbary and Palestine to about 60° N. lat. in the east, and from Mexico to a similar latitude in the west. South of these limits they do not occur in a wild state. The flowers appear in the greatest profusion, usually in terminal cymes, in the early months of the year, and are succeeded by small round fruits, coloured yellow, red, purple, or black. Most of them are merely haws, and fit only for the food of birds; a few are larger and more fleshy, but none of them have been found worth cultivating for the fruit, except the azarole (*Cratægus Azarolus*), which is eaten in Italy, and the aronia, which is sold in the markets of Montpellier under the name of *Pommettes à deux closes*.

Between sixty and seventy well-marked species and varieties are known in the gardens of this country. Into extensive collections they are all worth introduction except *Cr. parvifolia* and those immediately allied to it; and for the ornament of park scenery there is probably no genus of flowering trees at all to be compared with *Cratægus* for variety, fragrance, and beauty. Our limits prevent our noticing all these at length; we therefore confine ourselves to a brief indication of those which are most valuable for ornamental purposes.

Under the name of *Hawthorns* we would comprehend all the numerous sorts which are either varieties of *Cratægus oxyacantha*, or nearly related to it. They have all deeply-lobed rather shining leaves so little hairy that their bright green colour is not deadened, small fragrant flowers, and small shining haws. They are distinguished for the graceful manner in which they generally grow in rich soil and unharmed by the pruning-knife. Thirty feet is not an unusual height for very fine specimens, and when of that size their appearance is exceedingly graceful and picturesque. *Cr. oxyacantha* itself produces varieties with double flowers, bright crimson flowers, yellow fruit, black fruit, and fruit downy when young; the latter is called *Cr. oxyacantha eriocarpa*, and is one of the most beautiful of the genus. Besides these we would recommend most particularly to planters the *Cr. heterophylla*, or Constantinople thorn, which is more erect and rigid in its manner of growth than any of the varieties of *Cr. oxyacantha*, and grows remarkably fast.

Very nearly allied to these are the *Oriental Thorns*, species which have their deeply-cut leaves covered so closely with hairs as to have a dull grey or hoary aspect, large fragrant flowers, and large succulent rather angular fruit. These are less graceful in their manner of growth than the true hawthorns, some of them, especially *Cr. tanacetifolia* and *odoratissima* having a round formal head; but their flowers are even more fragrant than the May-bush, and their fruit renders them striking objects in the autumn. The azarole is one of them; but it does not fruit or flower readily, and is the least worth having of the group. What we should recommend are *Cr. odoratissima*, with its red, *Cr. tanacetifolia*, with its yellow, *Cr. orientalis*, with its purple, and *Cr. Aronia*, with its light orange-coloured fruit.

The *American Thorns* are species with leaves but little lobed, usually broad, shining, and toothed unequally, often having exceedingly long spines, and having fruit generally of an intermediate size. They are not quite so handsome as the species of the two former groups; but the following, nevertheless, have sufficiently ornamental features, viz., *Cr. crusgalli*, or the Cockspur thorn, with very long strong spines and shining deep-green leaves; of this we have a broad-leaved variety called *splendens*, and a narrow-leaved variety called *salicifolia*; *Cr. prunifolia*, *ovalifolia*, and *Douglasii*, with dark handsome leaves; *Cr. punctata*, with large yellow or red haws; *Cr. cordata*, with brilliant scarlet fruit, and *Cr. microcarpa*, with very small beautiful vermilion fruit and graceful pendulous shoots.

The *Small-leaved Thorns* are all North American:

they form small straggling bushes, and are not worth cultivation.

Finally, the *Evergreen Thorns* consist of *Cr. mexicana* and *pyracantha*. The former is a small tree, with lance-shaped bright green leaves and large round yellow fruit; it is probably too tender for hardy cultivation north of London. The latter, an inhabitant of rocks and wild places in the south of Europe and the Caucasus, has so long been cultivated for the sake of its flame-coloured berries and evergreen leaves as to require no description here.

All these plants may be budded or grafted upon the common hawthorn, so that persons whose means do not allow them to purchase the plants may nevertheless ornament their gardens with them by providing hawthorn stocks, upon which they may work them themselves; or a very small garden might exhibit a good many sorts, if each of the groups here pointed out were intermixed upon the same plant; this might be easily effected by a skilful budder. It would not, however, do to intermix the different groups upon the same plant, because the species would not harmonize, and consequently a bad appearance would be the result.

(See Loudon's *Arboretum and Fruticetum Britannicum*, part iii., and the *Botanical Register*, vols. 21 and 22, for more detailed information concerning these plants.)

CRATERUS. [ALEXANDER III.]

CRATES, the name of several Greek writers. I. A comedian of Athens, one of the most eminent of the predecessors of Aristophanes, who speaks very favourably of him. (*Eqq.* 537.) He is said to have been originally one of Cratinus' actors (Schol. on Aristoph. *Eqq.*), but he could not have been so very long, since he was well known as a comic writer in 450 B.C. (Euseb. *ad Olymp.*, 82, 2.) Aristotle tells us that he was the first who introduced regular plots into his comedies. (*Poet.* c. v.) II. A Cynic philosopher, the son of Ascondas of Thebes, who flourished about the year 328 B.C. He was living in 307 B.C., when Demetrius Phalereus retired to Thebes. (Diogen. Laërt. vi. 85; Plutarch, *Mor.*, p. 69, c.) He was a disciple of Diogenes and Bryson, and was surnamed the 'door-opener' (*θυροπαικτήρης*), from his habit of entering any house he pleased whether invited or not. (Suidas.) III. A philosopher of the old academy, son of Antigenes, and born in the deme of Thria in Attica. He was a disciple of Polemo, to whom he was much attached, and the instructor of Arcesilaus and Bion the Borysthenite. (Diog. Laërt. iv. 4.) He flourished about the year 287 B.C. (See Clinton's *Fasti Hellenici*, ii., p. 183.) Cicero says, that his philosophical doctrines did not at all differ from those of Plato. (*Academ.* i. 9.) IV. A celebrated grammarian and stoic, son of Timocrates, and born at Mallos in Cilicia. He was sent as ambassador to Rome by Attalus, king of Pergamus, about the year 159 B.C. (See Clinton, *Fasti Hellenici*, iii., p. 89.) His works were very numerous. (See a list of them in Clinton, iii., p. 528, note e.)

CRATINUS, the son of Callimedes, a writer of the old comedy, was born at Athens 519 B.C. It is not known when he began to write comedies; it is inferred, however, from the words of Aristophanes (*Eqq.* 524-530), that he did not appear as a dramatist till somewhat advanced in life. (See Clinton's *Fasti Hellenici*, vol. ii., p. 49.) He was the most formidable adversary of Aristophanes: two occasions are recorded on which the judges pronounced him only second to that great poet; and in 423 B.C., the first prize was awarded to his comedy called the 'Wine-Flask,' the 'Connus' of Ameipsias being placed second, and the 'Clouds' of Aristophanes third. He died the year after. Cratinus was highly esteemed by his countrymen, and at one time, according to his rival Aristophanes, was so much in fashion, that no songs were listened to at banquets except choruses from his comedies. In his old age he was much addicted to drinking; and in his last play he shows how his faithful wife *Comedy* strove to get divorced from him in consequence of his exceeding love for his fascinating mistress the *Wine-Flask*. (See the Scholiast on Aristoph. *Eqq.* 401.) Aristophanes frequently alludes to this failing of his contemporary. (See, for instance, the *Peace*, 701.) The names of forty of his comedies have come down to us. (Fabricius, *Bibl. Græca*, ii., p. 431.)

CRATIPPUS, a Peripatetic philosopher, born at Mitylene. He was a contemporary and friend of Cicero, who thought him the first philosopher of the age (*De Officiis*, 'a Cratippo nostro, principe hujus memorie philosophorum'),

and intrusted his son Marcus to his care at Athens. (*De Officiis*, i. 1.) He taught first in his native place, where he was still residing when Pompey came thither after the battle of Pharsalia; he had an interview with the defeated general, with whom he conversed on providence. (Plutarch, *Pomp.*, c. lxxv.) Afterwards he went to Athens, and Cicero not only got him made a Roman citizen by Julius Cæsar, but even prevailed upon the Areopagus to vote that he should be requested to continue at Athens as an instructor of youth, since he was an ornament to the city. (Plutarch, *Cicero*, c. xxiv.) Brutus went to Athens to hear Cratippus while engaged in preparations to meet the army of the Triumvirate. (Plutarch, *Brutus*, c. xxiv.) Cratippus wrote a treatise on divination, in which he allowed that kind which was derived from dreams and the ravings of idiots, but denied all other sorts of divination. (Cicero *de Divinat.* i. 3 and 32.) In addition to his merits as a philosopher, we are told that he was an amusing companion, and gifted with great powers of conversation. (Cicero *ad Familiares*, xvi. 21.)

CRAWFISH. [ASTACUS. CRUSTACEA.]

CRAYONS (from the French *crayon*, derived from *craie*, chalk) are a species of material for drawing, and may be considered as of two kinds, native and artificial. The principal native crayons are black, white, and red. The best black is procured from Italy. It is a species of earth, which is soft in the ground, but hardens on exposure to the air. It is of a bright even tint, and of a smooth and moderately hard texture. Admirably adapted to outlining and shading drawings of any size, it is the artist's best tool for study. It will form a large, bold, and strong line, and is at the same time capable of extreme fineness. The best white is a pure chalk, and is procured in France. It is of a brilliant colour, but very brittle; so that it is difficult to avoid breaking it frequently. There are various modes of correcting its brittleness, such as soaking it in milk, baking it on hot iron, or in the fire; but they all, more or less, injure the brilliancy of its tint. Pipe-clay is sometimes employed as a substitute, as being smoother and less brittle; but it is of a very inferior tint. White chalk is used on tinted paper to touch on or hatch the high lights. It is also much used by the painter to determine or correct his outline. Red chalk is employed in the place of black chalk on white or tinted paper, because it is freer than the best black chalk, and firmer and smoother than the inferior kinds. It is also of a warmer and more agreeable tone of colour; but it is by no means capable of the same degree of fineness in small or highly-finished drawings: it is a clayey ochreous substance. All these three kinds of native crayons are frequently combined in the same drawing, on tinted papers, which are generally of a neutral grey, of a blueish, greenish, or brownish quality.

Artificial crayons are composed of different coloured earths, and other pigments, rolled into solid sticks with some tenacious stuff such as milk, common gin, or beer-wort. The best are procured from Switzerland. They are employed in crayon painting upon a ground composed of paper or vellum, stretched upon a canvas, which has been previously extended on a deal frame. It is requisite to paint with cooler tints in crayons than in oils, which is the reason why crayon painters generally fall into such a cold style of colouring when they work in the other material. Great softness and delicacy and great vivacity of tint may be obtained in finished crayon paintings; but depth, richness, and truth of colour, are not attainable, nor solidity in the forms. Moreover, the delicacy proper to the substance is tolerably certain to betray the artist who devotes himself solely to its use into a petty and weak style of drawing. For sketches of portraits, in which the form and expression, and a general idea of the complexion, are all that is required, crayons are a very pleasing and useful material; but they should be employed only occasionally, and as a variety to other modes of study.

The native crayons are the legitimate materials for the artist in the study of drawing, and in tracing the first thoughts of design. Some of the sketches of Raphael, Michael Angelo, the Caracci, and others of the great painters, remain to attest the utility of crayons in forming the style of a painter or sculptor, and their capability of expressing the highest qualities of design.

An instrument called a portcrayon is employed to hold the crayon by. It is a metal tube, split at each end, so as to gape a little to admit the crayon; a sliding ring em-

braces the tube, and may be made to close the disparted sides firmly upon the crayon.

A stump, made of leather, cork, or paper, closely rolled, or cut into a short round stick, more or less sharply pointed at each end, is used to soften and spread the chalk or crayon in the shaded parts of the drawing.

CREAM. [BUTTER.]

CREAM FRUIT, a kind of eatable fruit found at Sierra Leone, and said to be produced by some apocynaceous plant.

CREASOTE or KREASOTE (from *κρέας*, 'flesh,' and *σώζω*, 'to save,') is a fluid compound of oxygen, hydrogen, and carbon, obtained by Reichenbach. This substance exists in crude pyroligneous acid, but it is best prepared from that portion of the oil distilled from wood-tar which is heavier than water. The operation is too complicated to admit of its being stated at length. The properties of creasote are the following:—It is a colourless transparent fluid, and has a strong odour which greatly resembles that of smoked meat, with a caustic and burning taste. Its specific gravity is 1.037; it boils at 397°, and remains fluid at 17° below zero. It requires 80 parts of water for solution, and is soluble in alcohol, æther, and sulphuret of carbon, in all proportions. It burns with a sooty flame, refracts light powerfully, and is a non-conductor of electricity; it has neither acid nor alkaline properties. It is highly antiseptic, and hence the name given to it. It combines both with acids and with alkalis; but it is decomposed by strong nitric and sulphuric acid. It unites with chlorine, iodine, bromine, sulphur, and phosphorus.

Creasote coagulates albumen, even when much diluted, and it also coagulates serum. Meat and fish are preserved after having been brushed over with creasote and dried in the sun; the antiseptic power of pyroligneous acid and wood-smoke is supposed to be derived from its presence. A few drops added to ink are said effectually to prevent its becoming mouldy. It is stated to be composed of—

Carbon	77.42
Oxygen	14.46
Hydrogen	8.12

100

Medical Properties.—The chemical analysis, as given above, shows this compound to contain a very large proportion of carbon; which circumstance, along with other peculiarities, renders it in certain cases a valuable medicine, and in other instances a formidable poison. The introduction, by its means, of a large quantity of carbon into the body, produces all the bad effects which an excess of that principle in the animal system is known to occasion; while in certain morbid states of the system, this increased quantity of carbon produces the remarkably sedative effect which has followed its use. There can also scarcely be a doubt but that the highly carbonized nature of this compound, along with its power of coagulating albumen, is the source of the powerful antiseptic properties which many of its combinations and solutions have been known for ages to possess. Independently of its general action on the system when taken internally, it produces, when concentrated, a local effect on the part to which it has been applied very necessary to be borne in mind, and which probably is owing to the power which creasote seems to possess of coagulating the albumen, even of living as well as of dead tissues, and which it is enabled to reach by destroying the epidermis of the part which it has been allowed to touch. Dropped upon the tongue it causes violent pain; unless largely diluted it cannot be swallowed, as, independent of the pain, it coagulates the albumen of all the fluids with which it comes in contact. Fibrine, carefully separated from other principles, is not affected by creasote.

A few drops of a very dilute solution of creasote taken into the stomach causes a sensation of warmth, and if repeated at short intervals, or the dose gradually increased, giddiness and other signs similar to those of intoxication are experienced. The urine is frequently observed to acquire a black hue, 'as if a small quantity of Indian ink had been added to it, perfectly transparent, and without sediment.' (*Medical Gazette*, vol. xvi. p. 599.) In larger doses it has all the effects of a narcotico-acrid poison, the venous state of the blood producing on the brain a markedly sedative effect, and the respiration becoming slow and laborious, or convulsive. Animals, fishes, and insects, plunged into creasote water speedily die with strong convulsions. Even plants watered with it perish, except perhaps those of the

tribe *Ericaceæ*, which constitute the chief vegetation of bogs or mosses.

Creasote has been recommended as a remedy in very many diseases, in few of which will it ultimately be found useful. Vomiting, including sea-sickness, some forms of bronchitis, cutaneous diseases, and hæmorrhage either spontaneous or from wounds, are the only cases in which it has a claim to confidence. Vomiting, such as frequently occurs in hysterical and other persons from irritation of the origin of the eighth pair of nerves, will almost invariably be alleviated or checked; also that in sea-sickness, which proceeds from a similar cause, may be lessened, but scarcely any other kind of vomiting can be relieved by it. That form of vomiting which occurs towards the end of phthisis pulmonalis, and is connected with subacute inflammation of the stomach, is sure to be aggravated by it; as will any other, either caused by scirrhus, ulceration, or any crude indigested matter in the stomach. The utility of breathing the vapour of tar-water in some forms of bronchitis often mistaken for consumption, has been long known; but creasote can be of no service in true tubercular consumption, when cavities exist in the lungs. Creasote possesses great influence over external ulcers when it can be applied sufficiently strong to coagulate the albumen, and so form an artificial skin, under which the healing process goes on kindly. Thus in porrigo, especially ringworm of the scalp, and psoriasis, it is unrivalled. But poisoning has resulted even from its external application. Its power of coagulating the albumen of the blood renders it a most valuable styptic, and it may be employed to stop the bleeding mouths of even the largest arteries, such as the carotid, during surgical operations, or the flow of blood from leech-bites. In case of poisoning by creasote, moderate venesection and artificial respiration may be employed; the latter should be continued till by the operation of the lungs, the liver, and the kidneys, the system can free itself from the hurtful excess of carbon. The solution of creasote should always be prepared of a definite strength, to prevent unfortunate occurrences from an over-dose. Creasote is now extensively employed to preserve anatomical preparations for museums. It is likewise fraudulently added to whiskey to give the *peat-reek* flavour which many like.

CREBILLON, PROSPER JOLYOT DE, was born at Dijon in 1674, of an antient and noble family. He was sent by his father to Paris, to study the law, under a person named Prieur. The master and pupil were both attached to the theatre; and the former observing in Crebillon strong marks of a poetic genius, urged him to try his powers on a tragedy. Crebillon accordingly took the subject of the children of Brutus, which he carried to the actors, who however rejected it in a manner so little flattering to the feelings of an author, that he threw his manuscript into the fire, and gave up all thoughts of writing for the stage. Prieur would not suffer him to remain in this despondency, and the tragedy of 'Idoménée,' produced in 1707, was the fruit of his persuasions. The fifth act did not at first please the audience, but an alteration was made, and the piece was perfectly successful. In 1707 appeared his second piece, called 'Atrée,' which is founded on the horrible incident of Atreus bringing to Thyestes a cup filled with the blood of his own son. Prieur being in a declining state of health when this tragedy came out, was carried into a box: at the end of the representation he embraced Crebillon, and said: 'I die contented, I have made you a poet, and I leave a man to the nation.' The success of 'Atrée' was indeed very fair, but it was not until the production of 'Rhadamiste,' in 1711, that Crebillon's fame rose to its height, and it is on this piece that it chiefly rests. Boileau is said to have entertained a very mean opinion of 'Rhadamiste,' but this has been explained by the fact, that he had only heard the first two scenes, which are unquestionably inferior to the others. After the production of this piece, Crebillon did not much increase his reputation; his 'Xerxes' (1714), and 'Semiramis' (1717) were not very successful; and though 'Pyrrhus' (1726) was very well received, the author himself said he was surprised, as it was 'the shadow of a tragedy, rather than a tragedy itself.'

He did not bring out any other piece for twenty-two years. The death of his wife, and certain pecuniary difficulties, weighed down his spirits to that extent, that he was incapable of writing. However, at the end of that period he was allowed by the king a pension of 1000 francs, for which he was indebted to the persuasions of Mad. Pompa-

dour, who was instigated, it is said, by her hatred to Voltaire to benefit Crebillon, as these two authors were always looked on as rivals in the drama. His tragedy of 'Catilina' was now advertised, and great were the expectations of the public; the court were determined to patronize him, and the king himself furnished the requisite dresses. It was produced in 1749, and the applause was tumultuous. The public however on reading it began to retract their hasty praise, and it was objected that the tragedy was a very unfaithful picture of the manners of antient Rome, a censure which should not be passed on Crebillon as *peculiarly* distinguishing him from other authors of his school. 'Le Triumvirat' was produced when the author was eighty-one years of age, and had but indifferent success; he also began another tragedy, called 'Cromwell,' about this time, which was never completed.

Crebillon died in the year 1762, and a monument was erected to his memory in the church of St. Gervois, by the order of Louis XV. The French actors also caused a magnificent service to be celebrated in the church of St. Jean de Latran in honour of the veteran dramatist, at which all the literati and most of the nobility of France attended.

It is on the tragedy of 'Rhadamiste' (Tacitus, *Annal.* xii. 44, &c.), that the fame of this author rests; and in spite of the various solecisms which profound critics of the French language discover in this work, the English reader will find it more to his taste than many tragedies, the names of which are more familiar to him. The plot is highly interesting, and there is a fire in the character of 'Rhadamiste,' and a matronly dignity in that of 'Zenobie,' which arrests the attention of the reader, and prevents the tedium which many English readers feel in perusing a French tragedy.

Those who wish to know more of Crebillon may read a chapter on this author in La Harpe's 'Cours de la Littérature.' The chapter is a long one, and the extracts are so copious, and the reader's attention is directed so pointedly to the remarkable passages, that he may really learn more of Crebillon by reading that critique than by perusing the author's own works.

CREBILLON, CLAUDE PROSPER JOLYOT DE, son of the preceding, was born at Paris in 1707. He wrote a number of romances, which acquired a great popularity, owing, as some say, more to their extreme licentiousness than to any intrinsic merit. His strict moral character is always brought forward as a remarkable contrast to the great laxity of his writings. He was well known as a member of two convivial societies, called the *Dominicaux* and the *Caveau*, the latter of which enrolled among its names those of Piron, Collé, and Gallet. Crebillon the younger died in 1777.

The remark that his fame is only owing to his obscenity does not to us seem wholly true. Indeed the very author of this remark (*Biog. Univ.*) makes another which tends to weaken it. He says that Crebillon is too cold a writer, and wants that warmth of colouring which is requisite to render works of a licentious nature endurable. The fact is, that his novels, in spite of their outrageous indecency, contain a most accurate picture of the motives that actuate persons in a corrupt state of society. They are rather the works of a cynic, who tears the mask off vice, than of a voluptuary, who is absorbed in its contemplation; and if we regard them in this light, their grossness may be reconciled with his strict moral character. Still however the philosophy which they inculcate is of a morbid nature (being much like that of Rochefoucault), and only those whose minds are unsailable by impurity can peruse with any profit the novels of Crebillon.

CRE'CY, or (as it is frequently written in English works) CRESSY, a small town (bourg) in the department of Somme, in France, on the little river Maie, which falls into the æstuary of the Somme. It is in the midst of a territory fertile in wheat and other grain, and in grass: cattle, wool, and hemp are among the articles of trade. There are several tan-yards, and oil and corn-mills. There is a considerable forest in the neighbourhood. The population of the commune as given in Prudhomme's *Dictionnaire Universel de la France*, 1804, was 1207.

Crécy is chiefly known by the great battle fought near it, August 26, 1346, between the English and French armies under their respective kings, Edward III. and Philippe VI. (de Valois). The English, who had been plundering Normandie, and had carried their ravages to the neighbourhood

of Paris, were retreating when they were overtaken by the French. The force of the contending armies is usually estimated at about 30,000 English and 100,000 French: but Mr. Turner (*Hist. of England during the Middle Ages*, 2nd edit., Lond. 1825, vol. ii. p. 199) states the English army to have been as follows:—1st division, under the Prince of Wales (Edward the Black Prince), 800 men-at-arms, 2000 archers, and 1000 Welshmen; 2nd division, under the earl of Northampton and others, 800 men-at-arms, 1200 archers; 3rd division, or reserve, under the king in person, 700 men-at-arms, and 2000 archers. Allowing these numbers to have been doubled by the addition of the retainers of the men-at-arms, it will still give only 17,000 men. The English reserve was not engaged, and the king remained during the whole action at a windmill, surveying the fight and refusing to send aid, though his son, then a boy of sixteen, was hard pressed by the enemy, adding to the messenger who had entreated aid, 'Return, Sir Thomas, and tell those who sent you not to expect me while my son is alive. Tell them that I command that they let my boy win his spurs: for I wish, if God has so ordained, that the day be his own, and that the honour rest with him and those in whose care I have placed him.' The French were defeated very much through their own impetuosity and want of discipline. The butchery was dreadful, for the English, being so much inferior in number, showed no mercy. The king of Bohemia, the duke of Lorraine, the count of Alençon, brother of the king of France, the count of Flanders, eight other counts, two archbishops, and several lords and German barons, fell; and (according to the English account) 1200 knights and about 30,000 other persons. Philippe of Valois received two wounds, and was one of the last who fled. An equal or even greater number of French fell the next day in various rencontres, according to Froissart. The result of this fearful slaughter was the siege of Calais, which surrendered after a year's siege.

CREDENTIALS are the instruments which an ambassador or other diplomatic minister receives from his own government, authorizing him to appear in his diplomatic character, defining the extent of his powers, and showing to what rank of ministers he is intended to belong. The credentials are usually in the form of a closed letter, addressed to the power to which the minister is sent; but ministers are sometimes accredited by letters patent, which is the form commonly adopted when they are to be sent to a congress.

A minister cannot be received in any other character than that which is given him by his credentials; and for this reason he usually communicates their contents before he is admitted to his first audience. If he is accredited by letters patent, this is done by showing the instrument itself; but if his credentials are sealed, then by presenting a copy of them.

The powers granted by the credentials may either be confined to certain specified transactions, or extend generally to all negotiations whatever; and may, in either case, be either limited or unlimited; in which latter case the minister is styled a minister with full powers, or minister plenipotentiary. (Vattel, *Droit des Gens*, liv. iv., § 76; Klüber, *Droit des Gens moderne*, § 193, 194.)

CREDIT, in Political Economy. [BILL OF EXCHANGE. CURRENCY.]

CREDITON. [DEVONSHIRE.]

CREECH, THOMAS, is the translator of Lucretius, Horace, Theocritus, and detached portions of several other Greek and Latin authors, of which a list is given in Kippis's *Biographia Britannica*. He was born at Blandford, in Dorsetshire, in 1659, admitted of Wadham College, Oxford (of which he appears, from the title-page of his Lucretius, to have become a fellow), in 1675, and elected probationer-fellow of All Souls' in November, 1683. He published in 1682 his translation of Lucretius, which appears, on the testimony of a violent and foolish invective against the work, to have gained much credit at Oxford, and is his best work. Dryden, who himself translated parts of Lucretius, has bestowed high praise on his predecessor. (*Preface to first part of Miscellanies.*) Creech published a Latin edition of the same author in 1695, and a translation of Horace in 1684, the latter with very indifferent success. He was appointed to the college living of Woburn, Herts, in 1699; and two years afterwards, in June, 1701, hung himself in his chamber at Oxford. His temper was

very morose, which leaves room to ascribe this act to some constitutional infirmity.

CREED, from the Latin *credo* (I believe), the English name for those short summaries of Christian doctrine which in the continental churches are commonly called symbols, though sometimes also credos. The English church adopts, as 'thoroughly to be received and believed,' the three antient creeds, called the Apostles' creed, the Athanasian creed, and the Nicene creed; but it does not assert any of them to be inspired, nor does it even affirm the first-mentioned to have been actually drawn up by the apostles; it only says of them generally that 'they may be proved by most certain warrants of holy Scripture.' (Art. viii.) The Catholic church adopts along with these what is called the creed of the council of Constantinople, which contains some addition to what is said in the Nicene creed on the subject of the divinity of the Holy Ghost. Many other similar formulæ have been received at different times in particular churches.

CREEK is a small inlet on a low sandy coast. Such inlets occur also frequently in harbours inclosed by a low shore and along the banks of rivers. Sometimes, especially in harbours, creeks are formed by the mouths of small brooks and rivulets. In large rivers creeks are resorted to by small craft as harbours or landing places, and they are often visited by fish in spawning time. In the United States the name creek is very generally applied to small inland streams, which in England would be called brooks or rivers.

CREEK INDIANS were, at the beginning of the present century, one of the most powerful native tribes within the limits of the United States of America. They occupied nearly all the countries lying north of 31° N. lat. between the Flint river, the eastern branch of the Chatahoochee, and the Tombigbee or western branch of the Mobile river, and did not permit Europeans to settle west of the Flint. They then occupied a large part of the state of Georgia, and more than half of that of Alabama. In 1802 and 1805 they ceded the north-western portion of their territories to the United States; but in 1813 they joined their arms with those of the Spaniards in Florida against them, and were only defeated and subjected by a very destructive war in 1814. Though their number was much reduced by this war, it was still estimated at 20,000, of which number about one-fourth were warriors. At this period they were obliged to give up all the countries west of the river Coosa, a branch of the Alabama. In 1826 those of them who inhabited that portion of Georgia which lies between the Flint river and the Chatahoochee sold their lands and retired to the banks of the Arkansas, where a tract of land was assigned to them by the general government. Many of them are said to have emigrated to the Mexican state of Texas. Of their former territories the Creeks occupy at present only the north-eastern corner of Alabama, together with a small number of Cherokees. They have made considerable progress in civilization, having entirely abandoned a wandering life, and inhabiting fixed places. They have large flocks of cattle, and cultivate grain, maize, potatoes, and some roots and vegetables: they also have different kinds of domestic manufactures. They have schools established among them. Their language is a dialect of the so-called Floridian language, which is spoken by all the tribes south of the Tennessee river, and as far west as the Mississippi. The Seminole Indians in Florida are called Lower Creeks. The name Creeks was given to them by the first settlers. They call themselves Muskogees.

CREEPER (Zoology). Creeper-family, *Certhiadae*. A family of birds placed by Mr. Vigors under his order *Scansores* or *climbing birds*. 'The genus *Certhia*,' writes that author (*Linn. Trans.*, vol. xiv., p. 461), 'as originally instituted by Linnæus, contained, besides the true *Certhia* and its congeners which form the extreme family of the preceding tribe (*Picidae*), all those birds whose slender and gradually curved bills and delicate formation of body, added to their practice of employing their tongues in taking their food, indicated a strong affinity to each other, and which have since been particularized by authors under the various names of *Nectarinia*, *Cinnyris*, *Drepanis*, &c. To the group thus known and described by the Swedish naturalist, later ornithologists, who have strictly followed his steps, have added another, discovered since his time in Australasia, similar in habits and manners, and now distinguished by the generic title of *Meliphaga*. The whole of the birds,

however, thus united by close affinities, and as such generally brought together by systematic writers into one continuous series, are decidedly divisible into two distinct groups, naturally arranging themselves under different subdivisions of the order. The family of *Certhiadae*, as we have seen above, live upon animal food; while the remaining genera of the Linnæan *Certhia* subsist chiefly upon vegetable juices. The tongues of each, though similar in being more or less extensible, and in being the medium through which they are supplied with food, are equally distinct as the nature of the food itself. Those of the former are sharp, and of a spear-like form, as if to transfix the insects which are their prey; while those of the latter are divided into tubular filaments, which appear exclusively adapted to the purposes of suction. In other particulars they exhibit an equal difference. The *Certhiadae* climb, and their feet are of a conformable structure; but the feet of the *suctorial birds* are not only in general unsuited to that purpose, but they become gradually weaker, and of less use as they come nearer the type of the tribe, where they are so short and slightly formed, as to be serviceable only in perching, when the bird is at rest. . . . The two groups of the Linnæan *Certhia* are disposed in the separate departments to which the distinct nature of their food and habits more immediately unites them; while at the same time, by their forming the extremes of their respective tribes, and touching each other at the corresponding points of the circles in which they are arranged, their obvious affinities are preserved inviolate.'

Having thus shown that, according to Mr. Vigors, the *Certhiadae* on one side lead the way to the Tenuirostral group, we must go back a little to make the reader acquainted with its true place, in the opinion of Mr. Vigors, among the Scansorial birds. The strong affinity, he observes, between the *Picidae* (wood-peckers) and the *Certhiadae*, in their general habits of climbing and of feeding by their extensile tongue, needs no illustration. The difference in the form of the typical bill of *Picus*, and that of the true *Certhia*, the former straight and powerful, the latter curved and slender, is softened down by the intervention of the genus *Dendrocolaptes*, Herm., which, as it stands at present, includes some groups (*Dendrocolaptes* *Picus*) where the bill is as strong and as straight as in *Picus*; others (*D. scandens*), where the bill, still retaining its strength, becomes gradually curved; and others (*D. procurvus*), where the bill still further deviating from the type of the genus to which it belongs, assumes the full curve and slenderness of the bill of the typical *Certhia*. The Linnæan *Pici*, he remarks, include some species where the bill loses the straight and angulated form, and becomes curved and compressed; and these, of which *Picus auratus*, Linn., is the representative (*Colaptes*, Swainson), show in this particular a clear approximation to the true *Creepers*; while the latter exhibit an equal contiguity to the former, in some of the aberrant groups of the family, which retain the stiff shafts of the tail-feathers so remarkable in the true *Pici*. The conformation of the foot of the *Certhiadae*, shows a deviation from the perfect structure of the more typical *Scansores*, distinguishes them as an aberrant group of the tribe, and calls for a separation. In the *Certhiadae* the foot is not strictly scansorial; but though they have not two posterior toes like the *Picidae*, the single hind toe of the *Certhiadae* is considerably longer and stronger than it is in the generality of *Perchers*.

'In addition,' continues Mr. Vigors, 'to *Dendrocolaptes*, already mentioned, and the true *Certhia* of the present day, the family before us consists of a variety of genera strongly united by their corresponding habits. Among these, *Climacteris*, Temm., and *Orthonyx*, Temm., preserve the strong shafts of the tail-feathers, which are carried on to them from the true *Pici*. This construction gradually disappears in the remaining groups of the family; but the strong hind toe, and the tongue more or less extensile, and serving to spear their prey, is still conspicuous. Among such groups we may particularize the *Tichodroma*, Ill., and *Upupa*, Linn., together with the Linnæan *Sitta*, and the conterminous form of *Xenops*, Ill. Here also may be associated the *Opetiorhynchus* and *Anabates* of M. Temminck, as also the *Oxyrhynchus* of the same author. This genus may be observed to be connected with those groups of the present family which are united with the genus *Yunx* of the preceding; it is a perfect *Wryneck*, as justly asserted by M. Temminck, with a *Creeper's* foot. I wish not, how

ever, to enter into the affinities of these groups. We know but little of them as yet: and every day is bringing in fresh subjects, and fresh information on a department of the class which has hitherto, I know not why, attracted but little attention.

Mr. Swainson (*Fauna Boreali Americana*, vol. ii.) places the genus *Troglodytes* (wrens) among the *Certhiade*, which family he also places under the *Scansores*.

Cuvier, the Prince of Musignano, and Lesson, arrange the *Certhiade* under the *Tenuirostres*, and the following are the genera which M. Lesson enumerates.

Family character.—Bill sometimes very much curved, sometimes but little, sometimes nearly straight, rounded, slightly compressed, pointed; tongue simple, cartilaginous at the extremity; tail-feathers generally worn at the end. (Lesson.)

Genera. *Certhia*.

Bill moderately long, more or less curved, triangular, compressed, slender, pointed; nostrils basal, partially closed by a membrane; wings short, fourth quill longest; tail-feathers stiff, a little curved, pointed at the end. Example, *Certhia familiaris*, Linn.

[*Certhia familiaris*.]

Description.—Bill about half an inch long, slender and curved; head and neck above, streaked with black and yellow-brown; a white line above each eye; irides hazel; back, rump, and scapulars approaching to tawny; quills dusky, tipped and edged with white or light brown; coverts dusky brown and yellowish-white, producing a variegated appearance; a yellowish-white bar across the wing; breast and belly silvery white; tail-feathers twelve, tawny brown; length rather more than five inches; weight about two drams (Montagu), Pennant says five drams.

The Creeper, Common Creeper, Tree-creeper and Tree-climber, *Certhia familiaris*, Linn., is, according to Belon and others, the *Κέρθιος* (*Certhius*) of Aristotle (book ix., c. 17); it is *Le Grimpereau* of the French; *Picchio piccolo*, *Picchietto*, *Rampichino* and *Piccio rampichino* of the modern Italians; *Baumlaufer*, *Kleinere Grau-Specht*, or *Kleinste Baum-Häcker* of the Germans; *Krypære* of the 'Fauna Suecica'; and *γ Γρεπιανος* of the antient British.

Habits.—The creeper is a most restless and active little bird, ever on the alert, and climbing up and about the trunks and branches of trees intent on picking up its insect food. Though comparatively common, and a constant resident in Britain, it is not easily seen; for its activity in shifting its position makes it very difficult to follow it with the eye. At one instant it is before the spectator, and the next is hidden from his view by the intervening trunk or branch to the opposite side of which it has passed in a moment. The form of the tail and organization of the feet are beautiful adaptations for this sort of rapid locomotion. Its note is monotonous, and often repeated.

Nest in the hole or behind the bark of decayed trees, formed of dry grass, and the inner part of the bark, lined with small feathers, in which six or eight eggs are deposited: while the female sits on these she is regularly fed by the male bird.

Geographical Distribution.—Britain and the Continent of Europe. Pennant says, that it migrates to Italy in September and October. Latham states, that it is found in various parts of Germany and elsewhere on the Continent, and is also said to inhabit North America. This is confirmed by the Prince of Musignano, who, in his *Specchio Comparativo*, notes it as common and permanent near Rome, and rare near Philadelphia.

Temminck is of opinion that the *Certhia brachydactyla* of Brehm is identical with *Certhia familiaris*.

Tichodroma (*Petrodroma*, Vieill.).

Bill longer than the head, triangular at the base, slightly bent, rounded, entire, and depressed at the point; nostrils horizontal; tail-feathers nearly equal, with ordinary shafts; wings long, fourth, fifth, and sixth quill the longest. Example, *Tichodroma muraria*, C. Bonap.; *Tichodroma phænicoptera*, Temm.; *Certhia muraria*, Linn.

Description.—Summit of the head of a deep ash colour; nape, back, and scapulars bright ash; throat and front of the neck deep black; lower parts blackish ash; coverts of the wings and upper part of the exterior barbs of the quills bright red; extremity of the alar quills black: these quills have two large white spots disposed upon the interior barbs; tail black, terminated with white and ash; bill, iris, and feet black; length six inches six lines. Such is Temminck's description of the male in its nuptial or spring dress.

The female, according to the same author, has the summit of the head of the same bright ash as the back; the throat and front of the neck white, slightly tinged with ash; and the rest of the plumage like that of the male.

This bird is the *Grimpereau de muraille*, *Pic de muraille*, Ternier, *Eschelette* and *Echelette* of the French; *Picchio muraiolo* and *Picchio di muro* of the Italians; *Mauer Baumlaufer* of the Germans, and *Wall-creeper* of Latham.

[*Tichodroma muraria*.]

Geographical Distribution.—South of Europe. Tolerably abundant in Spain and Italy, always on the most elevated rocks, and very rare in the mountains of moderate height. Never found in the north, according to Temminck. The bird is common in Provence; and the Prince of Musignano notes it as permanent and rather rare near Rome, where it may, however, be seen creeping on the outward walls of St. Peter's. It is not a British bird, at least it has never been recorded as such.

Habits, Food, Nest, &c.—Temminck says that what the Creeper does upon trees the Wall-creeper does against the vertical faces of rocks, on which it sticks firmly (see cram-

ponnent fortement), without, however, mounting and descending by creeping. Clefts and crevices of rocks and the walls of old edifices are its favourite haunts, and sometimes, but very rarely, the trunks of trees. It feeds on insects, their larvæ and pupæ, and is particularly fond of spiders and their eggs. Belon has figured his example clinging to a pillar with a spider in its bill. The nest is made in clefts of the most inaccessible rocks and in the crevices of ruins at a great height.

The bird moults twice a year. It is in the spring only that the male has the black on the throat, and this ornament disappears before the other feathers fall. The females moult also twice, but without changing colour, which makes it impossible to distinguish the sexes after pairing and breeding time. The young may be distinguished from their parents before their first moult, but in winter no difference is observable. (Temminck.)

Dendrocolaptes (*Dendrocopus*, Vieill.)

Bill long or moderate, compressed laterally, rather strong, convex, straight or curved, or only curved towards the extremity, pointed; *Nostrils* lateral, round, open; *Tongue* short and cartilaginous. Third, fourth and fifth quills the longest. *Tail-feathers* stiff, pointed. *Hind toe* shortest; claws very much curved, channelled. Example, *Dendrocolaptes procurvus*, Temm. *D. trochilorostris*, Wied. Locality, Brazil.

Description.—Size of the blackbird. Bill strongly curved and nearly twenty lines long. Tail graduated and each feather terminated by a stiff point. General colour cinnamon, passing into dirty ruddy grey on the head and belly. There are numerous white spots on the head and neck.

[*Dendrocolaptes procurvus*.]

Climacteris.

Bill short, weak, very much compressed throughout its length, but little curved, oval-shaped; mandibles equal, pointed; *Nostrils* basal, lateral, covered by a naked membrane. *Feet* robust; tarsi of the length of the middle toe,

[*Climacteris Picumnus*.]

which, as well as the hallux, are extraordinarily long; claws large and curved, channelled on the sides, subulate, very much hooked; external toe united up to the second articulation, the internal toe as far as the first; lateral toes very unequal. *Wings* moderate; first quill short, second shorter than the third, which last and the fourth are the longest. (Temminck.) Example, *Climacteris Picumnus*.

Description.—Summit of the head deep-grey; nape and neck bright grey. Wings and two middle feathers of the tail brown; a large nankeen-coloured band passes nearly through the middle of the quills. Tail-feathers black, except at their origin and extremity. Throat and cheeks dirty white. Breast grey. Feathers of the lower parts white in the middle, bordered with brown. Lower coverts of the tail Isabella-colour, marked with transverse brown spots. Length six inches six lines. (Temm.) Locality, Timor, Celebes, and the North coast of Australia.

This genus bears a strong relation to the *Soui-mangus*.

Furnarius (*Opetiorhynchus*), Temm. *Figulus*, Spix.

Bill shorter than the head, as wide as it is high, compressed laterally, but little curved, entire, pointed; *Tongue* moderate, straight, worn at the point. *Wings* feeble. (Vieillot.) Type, *Merops rufus*, Gmel. Example, *Furnarius fuliginosus*, Lesson. *Certhia antarctica*, Garnot.

[*Furnarius rufus*.]

'The genus *Furnarius*, writes M. Lesson, 'was established by M. Vieillot for the reception of some small birds of Paraguay, the most celebrated among which have been placed among the Thrushes, the Creepers, the Bee-eaters and the Promeropidae. The most antiently known, the *Fournier* of Buenos Ayres (*Merops rufus*, Gm. *Figulus albugularis*, Spix), is often noticed on account of the manner in which it constructs its nest, viz.: in the form of an oven (four), whence comes its name. On this point we know nothing of the habits of the *Fournier brun*, which lives in South America, and which approaches much in other respects to *Merops rufus*, figured by Commerson under the name of *Hornero Bonariensium* and of *Turdus furnifaber*, and which is said to be an object of veneration at La Plata. As it ought to be, the genus *Furnarius* should only contain the three species indicated by D'Azara, and that which we add under the name of *Furnarius fuliginosus*.

'This bird is five inches and a half in length; the bill is eight lines long, the tarsi an inch, and the tail two inches eight lines. The bill is slightly compressed, convex above, with the upper mandible slightly curved, entire, and exceeding the lower one. The tail is nearly rectilinear, composed of twelve feathers. The legs are feathered down to the tarsi, which are slender, elongated, with large but little apparent scutella. The middle toe is longest; the two outside ones nearly equal in length, and the external toe is united with the middle toe at its base. The claw of the posterior toe is double the length of the anterior toes, which are very much compressed at the sides, curved, and pointed. The entire plumage of the bird is a clear fuliginous brown spread equally over all the parts of the body, the neck alone exhibits yellow and brown ill-defined striæ. The under side of the tail is of a bright grey-brown. A yellow band of deeper tint occupies the middle of the great quills, and forms a kind of scarf when the bird is in flight; the extremity of the quills is a little deeper than the rest of the

plumage, and their external border is a shade brighter.' (Lesson.)

Locality.—*Furnarius fuliginosus* inhabits the Malouine islands. It lives upon the beach, where its familiarity and fearless disposition permits approach till it may be almost touched with the hand. Its sombre plumage has caused it to be mentioned under the name of *Merle* in the narratives of some voyages. Pernetty, who sojourned at the Malouines, thus describes it: 'This bird is so tame that it will almost fly upon the finger; in less than half an hour I killed ten with a small switch, and almost without changing my position. It scratches in the goëmons (*fucus*) which the sea throws upon the beach, and there eats worms and small shrimps, which they call sea-fleas (*puces de mer*).' Its flight is short. When disturbed it contents itself with flying two or three paces farther off. Its habits are solitary.' (Lesson.)

Cœreba.

(See NECTARINIDÆ.)

Dicæum.

Bill pointed, bent, of the length of the head, depressed and widened at the base.

The species forming this genus, instituted by Cuvier, are small, oriental, have more or less of scarlet in their plumage, and differ from the true *Certhiæ*, inasmuch as their tails are not worn, nor do they creep. It is questionable whether they do not belong to the *Nectarinidæ*; but their position will principally depend upon their habits and the form of their tongue. Cuvier places the genus next to *Le Four-nier* (*Merops rufus*) and under *Nectarinia*.

[*Dicæum erythronotus*.]

CREES and CHIPPEWAYS. These constitute at present one of the most numerous and most widely extended of the aboriginal nations which inhabit the interior of North America. The Crees, formerly called by the French Knistineaux, inhabit the shores of Hudson's Bay from Moose River, which falls into the south-western corner of James Bay, to the mouth of Churchill River (about 59° N. lat.), and hence they extend westward to the Athabasca Lake, and to the plains which lie betwixt the forks of the Saskatchewan, near Carlton House. They do not extend to the Rocky Mountains, the plains lying along the base of this range being in possession of a branch of the Assiniboin Indians, who are of the Sioux stock, and speak the language of the Iroquois or Hurons. The Chippeways inhabit the country about Lakes Michigan, Huron, and Superior. But it seems that many other tribes belong to the same stock as the Crees; for all the nations which are within the limits of the United States north of the Ohio and east of the Mississippi speak languages which may be considered only as dialects of that spoken by the Crees and Chippeways. [ALGONQUINS.]

The Lennapi, one of these tribes, have a tradition amongst them, that 'their ancestors, coming from the westward, took possession of the whole country from the Missouri to the Atlantic, after driving away or destroying the original inhabitants of the land, whom they termed Alligewi. In this migration and contest, which endured for a series of years, the Mengwe or Iroquois kept pace with them, moving in a parallel but more northern line, and finally settling on the banks of the St. Lawrence and the great lakes from whence it flows.' (Richardson in *Franklin's First Journey*.)

M'Keevor gives the following description of this race:— 'They are, for the most part, tall, large-boned, and long-visaged, with very prominent features; the eye is penetrating, and of a deep black colour; the nose prominent, of an aquiline shape, not at all flattened; the forehead is short and straight; mouth large, but lips not at all everted; hair uniformly of a shining black, straight and coarse, having no disposition whatever to curl. When viewed in profile, the parts appear more deeply and distinctly marked than in the Esquimeaux. The ear is not placed so far back on the head, nor is the space between the eyes at all so great as in the last-mentioned nation. The general expression of the countenance is gloomy and severe. They have little hair on their chin or upper lip, owing to its being eradicated immediately on its first appearance. The females differ considerably both in person and features from the men, being short, small-boned, with the face approaching more to the rounded form. They have, for the most part, an expression of mildness and sweetness in their looks.'

The Crees, like the other tribes of North America, live upon the produce of the chase and the fisheries in the numerous lakes and rivers by which their country is watered. No kind of agriculture has been introduced among them, as among those tribes that inhabit the southern portions of the United States. This is chiefly to be ascribed to the general sterility of the countries which they inhabit, and partly to the rigour of the climate. Even in the European settlements no attempt to sow and plant has been made north of Carlton House, on the Saskatchewan, and at the latter place only on a small scale. The hardships to which their manner of life frequently exposes them, and the want of food for some weeks together, sometimes compel them to commit cannibalism. Instances of this kind are on record, even of parents having fed on their own children; but these extreme cases are of rare occurrence. They commonly evince a strong affection for their offspring, and bewail for a length of time the loss of their relations.

Europeans are very little acquainted with the language of the Crees. M'Keevor has added a short vocabulary to his voyage. Dr. Richardson collected a copious and valuable vocabulary, which is still unpublished. Mr. J. Howse of Cirencester, who was in the service of the Hudson's Bay Company for twenty years, is now preparing, under the sanction of the London Geographical Society, a grammar of the Cree language, which will, we feel confident, throw a new light on the structure of the Cree and all the cognate languages of the North American continent. (Hearne, Richardson, M'Keevor, *Voyage to Hudson's Bay*.)

CREFELD, a minor circle in the Prussian province of Düsseldorf, lying on the left bank of the Rhine, and bounded on the north and west by the province of Cleves. Its area is about 88 square miles; the surface is completely level, and the soil, though in parts light and sandy, is productive, and very favourable for the cultivation of rye, oats, and buckwheat, flax and fruit. The Rhine skirts it in the east, and the Nierse in the west. The arable land consists of about 45,000 acres, which form above three-fourths of the whole surface. Agriculture is the chief employment of the inhabitants; and next to this the rearing of cattle, and manufacturing, which last is principally carried on in and about the town of Crefeld. The circle contains three towns (Crefeld, 19,000 inhabitants; Uerdingen, 2200; and Linn, 980), twenty-two villages, and twenty-one hamlets. The population was in 1816, 32,069; in 1826, 35,446; and in 1831, 37,611.

CREFELD, the chief town of the circle, lies in a low marshy situation, and was surrounded with walls and ditches as early as the year 1373; 51° 20' N. lat., and 6° 32' E. long. It is well and regularly built, and being encircled by gardens and country seats, is one of the prettiest spots in this part of Germany. The houses are about 1600 in number, and the inhabitants about 19,000: in 1784 they were 5800, in 1816, 9839; and in 1831, 18,738. The town contains a Roman Catholic church, two Protestant churches, a synagogue, and a place of worship for the Mennonites, of whom there are about 800; an orphan asylum, hospitals, a house of correction, and a school in which girls are taught all kinds of female labours. The manufactures to which Crefeld is indebted for its prosperity were set on foot by the Protestants, who sought refuge here from religious persecution at the end of the seventeenth and beginning of the eighteenth centuries. The chief branches of these manufactures are silks and

velvets; they are carried on both in the town and its immediate neighbourhood, and afford employment to upwards of 6000 hands; their produce is estimated at more than 500,000*l.* a year. The other branches of manufacture are cotton-yarn, woollen cloths, and kerseymères, flannel, stockings, linens, hats, gloves, thread, refined sugar, tobacco, soap and starch, looking-glasses, sheet-iron, iron and copper wares, and felt for hats. The trade of Crefeld is brisk and extensive, particularly in its own products, and it has three good fairs in the course of the year.

CREMA, the town of. [LODI.]

CREMNITZ (Hungar. Kőrmöcz-Bánya), a mining-town in the northern part of the county of Bars, in Hungary, situated in a narrow gloomy valley, closed in by seven high hills. It is a royal free town, and the place where the earliest mines in the kingdom were opened; 48° 42' N. lat. 18° 53' E. long. The inner town, even with the castle, contains only 39 houses, but its suburbs are extensive and add 582 more to the number. The population is about 5500, mostly Germans or Slavonians, who derive their subsistence from the adjacent mines. Among the buildings of note are the archiepiscopal residence, the principal church, with two lofty richly-gilt steeples and a coppered roof, built by the townsmen in 1461, four other churches, the chancery, mint, town-hall, royal gymnasium, Roman Catholic high school, royal hospital for the miners, an hospital for the townspeople, and a convent. It is the seat of a subordinate board of mines, and coins the celebrated Cremnitz ducats. The royal mines in the neighbourhood produce gold, esteemed the finest obtained in Europe, and silver, and employ between 800 and 1000 workmen. The waters of these mines contain a large quantity of sulphate of iron. The smelting-houses on this spot smelt not only all the ores found here, but what the Schemnitz and Kieschlich mines yield. The produce of the Cremnitz mines has greatly fallen off of late years. The town contains a Normal school, a Lutheran school; two paper-mills, and a manufactory of earthenware and of red lead. It is the most antient free town in Hungary.

CREMONA, the province of, in the Lombardo-Venetian kingdom, is bounded to the north by the province of Brescia, east by that of Mantua, south by the Po, which divides it from the Duchy of Parma, and west by the province of Lodi. Its length is about 40 miles from north-west to south-east, and its breadth is about 15. The Po, the Oglio, and the Adda are the principal rivers of the province. It is entirely a country of plains, forming part of the great level of Lombardy.

It is divided into nine districts, which are subdivided into 187 communes, with a population, in 1835, of 184,987 inhabitants, being an increase of 835 upon that of the year 1834. (*Bollettino Statistico di Milano*.) The districts are: Cremona, Soncino, Soresina, Pizzighettone, Robecco, Pieve d'Olmi, Casal Maggiore, Piadena, Pescarolo. The country is very productive in corn, flax, wine, oil; it also produces silk, cheese, honey, and wax. There are in the province 148 elementary schools for boys, attended by 7353 pupils; and 39 female schools, attended by 2339 girls. (*Report of 1833*.) At Cremona and Soresina are two female colleges for secondary instruction. At Casal Maggiore is a private establishment for secondary education for boys, and at Cremona a gymnasium and a royal lyceum. The Po and the Oglio being subject to overflowings, considerable sums are spent yearly by the treasury in repairing the embankments. The communal or cross roads constructed or repaired in the province cost, in 1831, the sum of 113,142 *livres*; in 1832, 191,838 *livres*; and in 1833, a sum of 129,219 *livres*. The two principal towns of the province, besides the capital, are Casal Maggiore, with about 4000 inhabitants, and Pizzighettone, a fortress of considerable strength on the east bank of the Adda.

CREMONA, the capital of the province, and a bishop's see, 45 miles south-east of Milan, is situated on the north bank of the Po, and surrounded by walls flanked with towers and wet ditches. A navigable canal, which communicates between the Oglio and the Po, passes through the town. The Po is navigable for large boats from Cremona to the sea. The town is five miles in circumference, but its population is not more than 26,000, and consequently many of its streets, which are mostly regular and tolerably wide, appear desolate. Cremona has many good buildings, such as palaces and churches. The façade of the cathedral, which is a Gothic building, is orna-

mented with curious sculptures representing the signs of the zodiac and the rural labours of the various seasons. The interior is rich in paintings of native masters, Moretti, Malosso, Boccacino (who is styled the Raphael of Cremona), Sojaro, &c.; and also in sculptures, especially by Sacchi, a Cremonese artist of the thirteenth century. The other remarkable churches are S. Nazario, which contains some master-pieces of the brothers Campi, distinguished painters of Cremona; S. Pietro al Po, S. Abbondio, S. Lorenzo, Sa. Pelagia, also possess paintings of the Cremonese school. At Sa. Pelagia are two inscriptions in honour of Girolamo Vida, a distinguished prelate of the age of Leo X., who was a native of Cremona. Vida, who has been praised by Ariosto and by Pope, is the author of a Latin poem on the life of Jesus Christ, from which Tasso has not disdained to borrow some fine passages of his Jerusalem, and also of an 'Ars Poetica,' a didactic poem, which is much esteemed. The town-house on the great square, the new market, the theatre, and some of the gates of the town, are worthy of notice. But the famous tower or belfry ending in a spire, which is one of the loftiest in Italy, is the wonder of Cremona: there are about 500 steps to ascend up to the bells. The spire is a conspicuous object for many miles around in the plains of Lombardy. About one mile outside of the town is the church, formerly an abbey, of S. Sigismondo, founded by Francisco Sforza I., duke of Milan, who married here Bianca Visconti: it is full of paintings. (Panni, *Rapporto delle Pitture che trovansi nelle Chiese della Città e Sobborghi di Cremona*.) There are also in Cremona some private galleries of paintings, of which that of Count Ponzoni is the principal. Cremona is the residence of the delegate or governor of the province. It has civil, criminal, and commercial courts, a lyceum, and a gymnasium, and a school of the fine arts. It is also the first city in Italy where infant schools were established in 1829, through the exertions of a philanthropic clergyman, Abate Aporti. Being encouraged by the local authorities as well as by the Austrian government of Lombardy, these schools are spreading to Brescia and other provinces. In the town of Cremona there are several infant schools: one is mentioned in which the pupils pay from two to three *livres* a month, and which is attended by 80 or 90 children; two others are gratuitous or charity schools, in which about 340 children of both sexes and of poor parents are instructed, and have their dinner given to them. (*Bollettino Statistico*, 1834.) Children remain at school from morning till night; they are admitted from two to six years of age, after which they go to the public elementary schools. Their physical as well as intellectual, moral, and religious education is attended to. Aporti has published an interesting account of these institutions, with the method of instruction pursued in them, a catechism, &c.: *Manuale d'Educazione ed Ammaestramento per le Scuole Infantili*, Cremona, 1833. A notice of Aporti's labours appeared in No. XIX. of the *Journal of Education*, 1835. There are also holiday schools at Cremona and in various parts of the province, in which boys above twelve years of age who have left the elementary schools receive instruction, especially in the branches of knowledge connected with the mechanical arts, such as drawing, &c. These schools are open at certain hours on Sundays and other holidays which are kept in Catholic countries.

Cremona carries on a considerable trade in agricultural produce by means of the Po and the various canals communicating with that river. It has manufactures of silks and cottons. It was once celebrated for its violins and musical strings, but that branch of industry appears to have greatly declined. The high road from Milan to Mantua and Venice passes through Cremona.

Cremona was in the territory of the Galli Cenomani. It was colonized by the Romans under the consuls T. Semonius and P. Cornelius, at the time when Hannibal was marching against Italy (Tacitus, *Histor.*, iii. 34) as a place of defence against the Gauls and other enemies from the north. It became a populous and flourishing town. In the civil wars of the triumvirate it was plundered by the soldiers of Octavianus, and its fertile fields were divided among fresh colonists, the former owners being driven away, a calamity pathetically alluded to by Virgil in his *Bucolics* and *Georgics*. Virgil was born at Andes, between Cremona and Mantua. In the war between Vitellius and Vespasian the citizens sided with the former, upon which the victorious army of Vespasian having entered the town,

plundered and burnt it. Tacitus (*Hist.*, iii.) has given a fearful account of that catastrophe. Cremona was restored by Vespasian. After the fall of the empire, it underwent the same vicissitudes as the other cities of Lombardy: it suffered severely at the hands of Frederic Barbarossa, was afterwards distracted by the Guelf and Guibeline factions, had its petty tyrants, and at last fell under the dominion of the Visconti of Milan, since which time it has continued to form a part of the Milanese state. (F. A. Zacharia, *Cremonensium Episcoporum Series cum Dissertatione de Cremonæ Origine, Amplitudine, &c.*, 4to, 1749.) The literary history of Cremona has been written by Arisio, *Cremona Literata*, 2 vols. fol., 1702-6.

CREMO'NA, a general name given to violins made at Cremona in the seventeenth century by the Amati family, and by Stradiuarius at the commencement of the eighteenth. These instruments excel all others, and the choicest of them bear very high prices. [VIOLIN.] Cremona is a name erroneously given to a stop in the organ; it ought to be Krumhorn, a sort of cornet, of which it is intended to be an imitation.

CRENA'TULA. [MALLEACEA.]

CRENILA'BRUS (Cuvier), a genus of fishes of the section Acanthopterygii and family Labridæ. The species of this genus have all the general characters of the true *Labri*, or *Wrasses*, but are distinguished by their having the margin of the preoperculum denticulated: the cheeks and operculum are scaly.

Four species of this genus have been found off the British coast, of which the common one, *Crenilabrus tinca* (*Labrus tinca* Linnæus), is called the Gilt-head, Connor, Golden Maid, &c. This fish is found on various parts of the coast; it is about six inches in length, and the depth is nearly one-third of the length. The general colour of the body is obscure red and green; these colours are arranged in longitudinal stripes on the upper parts, and beneath the lateral line the red is disposed in spots. The Gilt-head mostly frequents deep water, where the bottom is rocky; its food is chiefly Crustacea.

Crenilabrus cornubicus (the Goldfinny or Goldsinny) somewhat resembles the last, but may always be distinguished by a black spot on each side near the base of the tail, and situated on the lateral line; its general colour is yellowish green, darkest on the back; the sides are usually adorned with longitudinal lines of a deeper hue. Length about three or four inches.

Crenilabrus gibbus (the Gibbous Wrasse) may be readily distinguished from either of the known British species of this genus by its comparatively shorter and more elevated form. The depth of the body is considerably more than one-third of the length: the colours are chiefly orange and blue; the gill-covers and sides of the body are spotted, and the back is striped. The ventral fins are green, the pectorals are yellow, with transverse red stripes at their base.

Pennant obtained a specimen of this fish off the coast of Anglesey; and this is we believe the only instance on record of its capture off the British coast.

Crenilabrus luscus (the Scale-rayed Wrasse) has been once caught off the coast of Cornwall: the specimen was twenty-two inches in length. The tail is round, and consists of fifteen rays; 'between each ray of the dorsal, anal, and caudal fins, is a process formed of firm, elongated, imbricated scales. Colour, an uniform light brown, lighter on the belly; upper eye-lid black; at the upper edge of the base of the caudal fin is a dark brown spot. Pectorals yellow; all the other fins bordered with yellow.'

CREOLES, a word originally Spanish, and used to designate the children and descendants of European parents, who were born in the South American or West Indian Colonies, as distinct from the resident inhabitants born in Europe, as well as from the offspring of mixed blood, such as the Mulattos and Mestizoes, born of negro or Indian mothers. The Creoles of Spanish America were for a long time inadmissible to civil and political offices as well as to the higher ranks in the army; and even after Charles III. removed their disqualifications, they were still considered as inferior to the native Spaniards. This state of humiliation contributed perhaps as much as the climate to render them lazy and indolent. The insurrection of the Spanish colonies made the Creoles masters of the country, from which the native Spaniards were mostly driven away. In the West India Islands the Creoles are upon an equal footing with European natives. The Creole women are charac-

terized by the symmetry of their persons, the brilliancy of their eyes, and the sallowness of their complexions.

CREPI'DULA. [CALYPTRÆIDÆ.]

CREPUSCULA'RIA (Latreille), a section of Lepidopterous insects, corresponding with the genus *Sphinx* of Linnæus. These insects occupy an intermediate station between the *Lepidoptera Diurna*, or butterflies, and the *Lepidoptera Nocturna*, commonly called moths.

Distinguishing characters:—Antennæ growing gradually thicker towards the apex, at which part they are furnished with an elongated club, either fusiform or prismatic. Inferior wings furnished with a rigid bristle-like process at their base, which passes into a hook on the under surface of the superior wings, and serves to retain them. The larvæ are furnished with sixteen legs, and many of them have a long horny process on the last segment of the body. The chrysalides are smooth, or sometimes furnished with small spines (but destitute of the points and angles usually observed in those of butterflies); they are either inclosed in a cocoon or buried in the earth: the larvæ sometimes feed upon wood, in which case they assume the pupa state within the tree or branch.

The families contained in this section are the Sphingidæ, Sesiidæ, Ægeriidæ, and the Zygænidæ.

CREPU'SCULUM. [TWILIGHT.]

CRESS, the name given to various plants with acrid or pungent leaves. Common cress is *Lepidium sativum*; water-cress, *Nasturtium officinale*; Belleisle or Normandy cress, *Barbarea præcox*; Indian cress, *Tropæolum majus*.

CRESSY. [CRECY.]

CREST, from the Latin *crista*, the ornament of the helmet: a term in heraldry sometimes used for the helmet itself. Hence, *to crest*, to adorn as with a plume or crest, in Milton, *Par. Lost*, ix. 500,

'his head
crested aloft.'

In speaking of the cimier or crest, says Dallaway (*Inquiries into the Origin and Progress of Heraldry in England*, 4to., Glouc. 1793, p. 386), it will be necessary to describe the armour worn for the defence of the head, and the progressive embellishments which were added to its rude form, with the æra of their invention. Montfaucon, that most critical antiquary, has preserved many delineations of the antient Norman casque, which, when the whole body was invested in mail, was composed of iron framework, covered with leather, and quite flat at the top, to which shape succeeded the conical head. By the number of bars of which the beauvoir or visor consisted, when presented in front view, the rank of the wearer was ascertained; that of the esquire was always in profile and closed, to denote his vigilance and activity in battle. To Edmund Crouchback, earl of Lancaster, the origin of several heraldic novelties in this kingdom is readily referred, and his seal will be found to exhibit the crest, accompanied by the lambrequin and wreath, as the first instance, prior to the year 1286. The crest is said to have been carved in light wood, or made of leather, in the shape of some animal, real or fictitious, and fastened by a fillet of silk round the helmet, over which was a large piece of fringed samit or taffeta, pointed, with a tassel at the end. Before figures were introduced, plumes only were used, as well upon the head of the horse as on that of the warrior, which we gather from the seal of Baron de Spencer in 1296. The principal application of crests was in jousts or hastiludes, when the shield was not borne, but where they afforded an equal distinction; or by the chief commanders of horsemen in the field of battle. Originally of the highest importance, conceded by royal grant, and confined to very few persons; in process of time the assumption of them has become universal. They are not held to be absolutely hereditary, but may be assumed; and as females could not avail themselves of their primary use, accordingly no woman is allowed to bear a crest. As an appendage to sepulchral monuments, crests are placed beneath the head of the armed effigy, attached to the helmet by the wreath and lambrequin; and at the feet a lion or dog is invariably added. Upon many of the large altar tombs, so frequent in the sixteenth and seventeenth centuries, those both of the man and of his wife's family are carved at the feet of the recumbent figures.

Instances of crests formed of feathers may be seen in that of Sir Henry Percy, in Edward I.'s time, engraved at the bottom of plate xxiv. of Meyrick's 'Critical Inquiry into

Antient Armour,' and in that of Sir John Harsick, *t. Richard II.*, 1376, in plate xxxvi. of the same work: and many such occur in the illuminations to the contemporary manuscripts of Froissart's Chronicle. The custom of conferring crests as distinguishing marks seems to have originated with Edward III., who in 1333 (*Rot. Pat.* 9 Edward III.) granted one to William Montacute, earl of Salisbury, his 'tymbre,' as it is called, of the Eagle. By a further grant in the 13th of the same king (*Rot. Vasc.* 13 Edw. III. m. 4.), the grant of this crest was made hereditary, and the manor of Wodeton given in addition to support its dignity.

CREST. [DROME, Department.]

CRESTED DOGSTAIL GRASS. [CYNOSURUS.]

CRETACEOUS GROUP, in Geology, consists of the upper strata of the secondary* series immediately below the tertiary* series and superincumbent on the Wealden, or where that is wanting, on the oolitic system. This group is common to Europe, and also to at least a part of Asia. It consists of chalk resting upon either an arenaceous or argillaceous deposit. The chalk bears a remarkably uniform mineralogical character over a surface extending from the British islands through northern France, northern Germany, Denmark, and Sweden, into both European and Asiatic Russia. (*De La Beche, Res. in Theor. Geol.*) The cretaceous system is subdivided into the following strata:—

Chalk .	{ Upper Lower Marly	In which numerous species of marine fossils are found, amounting to about 260 genera and 768 species.
Green-sand	{ Upper Green Sand Gault	
	{ Lower Green Sand	

The area over which this system prevails in England, and the various strata which it contains, have been well defined by geologists. The following article is chiefly abstracted from a valuable paper on the subject inserted by Dr. Fitton in the *Geological Transactions*, 2nd series, vol. iv. p. 2. pp. 103—388.

The Cretaceous Group occupies nearly the whole of the south-eastern part of England: a line drawn from Crewkerne on the S.W. to Hunstanton on the N.E. forms its western boundary, and it extends from this line to the east coast, with the exception of a small part on the S.E. The same formation appears to prevail in the north of France, extending to the cretaceous district of Aix-la-Chapelle. The chalk, or upper portion of the system, is, in some parts, covered with the strata of the tertiary series; in other parts it is denuded. The green-sand crops out round its edge, which is broken and interrupted in many places where the lower strata appear.

On the N.E. the chalk appears in a narrower belt along the cliff from near Cromer to Hunstanton. From Cromer along the coast to the mouth of the Thames, and along the north bank of that river, it is concealed by the upper strata, which extend a considerable distance inland.

Beginning with Norfolk and proceeding southwards, the boundary line between the chalk and the superior strata, is about four miles east of Snettisham, two miles west of Diss, eight miles east of Mildenhall, between four and five west of Bury St. Edmunds, continuing to the north-east of Hertfordshire by Hertford and near St. Albans to three miles south-east of Wendover.

In the northern part of this district the chalk has in a few places been partially denuded. On the north-east there is a small piece of chalk along the banks of the Bure. The town of Norwich also stands upon chalk, which, in its vicinity, extends along the banks of the Yare and Wensum. There is a piece of chalk likewise at each side of small parts of the Stour and of the Orwell. The strata superincumbent on the chalk series extend a little beyond Uxbridge on the west, and then run in a narrow tongue to the north-west, three miles south of Wendover, which intervening space at that point is the whole width of the denuded chalk, Wendover being there its western limit. The chalk becomes wider towards the south-east, taking in Maidenhead; it is again partially covered a little to the west of that place, and continues in a very uneven line to Reading, Newbury, and a little to the east of Marlborough. The tertiary strata then run from west to east by Kingsclere, Basingstoke, Guildford, to three miles north of Dorking, round by the

Darent, and appears near Woolwich and Greenwich. Another detached portion appears in the north-west of Kent, taking in the Isle of Sheppey, and continues from the æstuary of the Medway along the coast to the Isle of Thanet. The chalk is covered on the west and north of Canterbury and at Sandwich; the beds which cover it terminate on the coast at Deal. On the south coast, from Worthing westward, the chalk is again concealed by the superincumbent series, extending nearly in a straight line through Chichester as far as a little to the east of Salisbury; it then continues in a south-west direction nearly as far as Dorchester. The chalk passes entirely across the Isle of Wight nearly from east to west, in a narrow ridge consisting of vertical strata, from Culver Cliff to Compton Bay; there is also a small piece on the south of the island. The limits of the chalk on the other side, where it is bounded by the outcropping of the lower strata of the system, remain to be noticed. The cliffs of the whole of the Isle of Thanet are composed of chalk. The chalk cliffs again commence near Deal, and are continued past Dover to East Weare Bay, a distance of about thirteen miles. As the chalk rises from Dover towards Folkstone the upper beds disappear, and the cliffs consist entirely of the lower members of that stratum. The rise of the marly chalk occurs about a mile and a half to the east of the escarpment of Folkstone hill, which is 566 feet high. Just at the rise of this bed there is a very copious and perennial spring called Lydden Spout. About two thousand paces west of this spring the cliff recedes from the sea, and the intermediate shore thence to Copt Point is occupied by a mass of ruins which has fallen from above. The sudden transition from the chalk cliffs is very remarkable. Turning inland the chalk range is bounded on the south by the outcrop of the green-sand strata, which extend four miles north of Ashford, three miles north of Maidstone, and is cut by the Medway, whence it forms a line curving outward to the south as far as the Darent, where it is five miles north of Sevenoaks. Merstham is on the boundary, which then continues in nearly a west direction, immediately north of Reigate, to Box Hill, near Dorking, and thence to Guildford, leaving a very narrow ridge of chalk. From Guildford to a point about two miles from Farnham there is a remarkable ridge called the 'Hog's-back,' produced by an upthrow of the chalk and the breaking off of the southern portion of the curve. The coast between Copt Point and Beachy Head, near these respective points, is occupied on each side by the green-sand, and the intermediate space by the Wealden clay and Hastings sand: the two latter do not belong to this series, being lower denuded strata. The Sussex chalk range, or South Downs, commences at Eastbourne, near Beachy Head, and continues thence along the coast beyond Shoreham and onwards in a west-by-north direction. The green-sand bounds it on the north, and leaves a range of chalk varying from eight to three miles in breadth. About three miles south-west of Petersfield the green-sand again sinks below the chalk, which is connected with the north range by the Alton chalk-hills, running from near Farnham to near Butser Hill (917 feet).

It now remains to define the boundary of the chalk from Dorsetshire on the south-west to Norfolk on the north-east. Part of it is thus described by Dr. Fitton:—'The great range of the chalk escarpment in the interior of England, which stretches like the shore of a sea or lake from Crewkerne in Dorsetshire to the north-east of Dunstable in Bedfordshire, is perfectly analogous in structure and appearance to the Downs of Surrey and Sussex. It is interrupted by three or four indentations or gulfs; one of great width, opening towards the west between Crewkerne and the heights about Stourhead, in South Wiltshire; another expanding to the north-west, and terminating in the defile where the Thames cuts through the chalk in its way to the south-east from Buckinghamshire and Oxfordshire. The vales of Pewsey and of Warminster are intermediate bays of the same general structure, but of smaller dimensions; and all these valleys are apparently the result of denudation, aided by previous disturbance of the strata, which has carried away the chalk and laid bare to various depths the strata beneath it.' (*Geol. Tran.*, 2nd series, vol. iv. part 2nd., p. 243.) From the heights near Dunstable, the upper chalk range passes through the north-west of Hertfordshire, by Hitchin and Baldock, to Barkway and Royston Downs, and thence by Balsham and Newmarket into Suffolk by Mildenhall, two miles west of Brandon, four west of Downham, by Nar-

* These terms are now considered objectionable by geologists, as not truly designating the different series; but since they are still commonly thus distinguished, it has been thought advisable to adopt the same classification here.

borough, and on to Snettisham. The chalk hills decline rapidly in height in the north-east of Bedfordshire. Kensworth-hill is 904 feet above the level of the sea; the hills east of that town are 850 feet high. Lilleyhoe is 664; Barkway Windmill, 513; the station near Royston, 484; Balsham, on the east of Cambridge, 380; Newmarket station, 267; Brandon, in Suffolk, 190 feet. The chalk hills stretching from Cambridgeshire to the north-west coast of Norfolk rise nowhere probably above 600 feet in height, bounding 'the fen country like the low shore of a sea.'

The chalk inland range is highest towards the central part between Wiltshire and Hertfordshire. In departing from that central tract, the rise is comparatively small both towards Devonshire on the south, as well as in the counties northwards. The chalk nearly disappears in Devonshire, a few insulated portions only appearing there; principally upon the coast between Sidmouth and Lyme and along a line from Beaminster through Chard and White Stanton. The transition from the chalk to the green-sand is here distinctly seen, especially on the south-west of Axmouth, where sections of the subjacent beds are exposed in the cliffs. In many parts of the chalk range, the upper and lower strata are well defined even by the outward features; a marked difference appearing in the vegetation and general aspect. The upper chalk has usually layers of flint nodules occurring at regular intervals, and is softer than the lower chalk. At Sandown Bay in the Isle of Wight the latter stratum is defined by a layer of distant and insulated flints which separates it from the flinty chalk above; it is sometimes of a greyish colour, as is also the bed of marly chalk immediately beneath it. This marly chalk is of a tenacious nature, and sustains the water which descends through the chalk; in consequence a line of ponds has been produced along the bottom of the escarpment of the South Downs. The *Malm-land*, remarkable for its fertility, is the soil over the lowest beds of marly chalk. The *Malm-rock*, immediately below the marly chalk, consists of stony beds belonging to the upper green-sand formation. Salisbury Plain, which is more than twenty-five miles in extent from west to east, and twelve miles from north to south, is occupied by the upper chalk. Though it has many inequalities of surface, it would be almost destitute of water, but for the Avon and its branches, which traverse it. But in the tracts occupied by the lower chalk, and still more in the chalk marl, there are few valleys without streams; hence, as well as owing to the difference of soil, the vegetation differs also, and the luxuriance of the lower regions, affords a strong contrast to the barrenness of the higher downs. Dr. Fitton observes, 'were it not that the colour is so nearly alike, these two groups would no doubt have been distinguished in geological maps by different hues; and they ought to be so, wherever the scale is sufficient to express the distinctive features above stated.' The village of Dunstable stands on the lower chalk, which may be distinctly traced from Totternhoe through Houghton Regis, Upper Sundon, and Streatley.

Accurate measures of the entire thickness of the chalk, have rarely been made in England; the following are however approximate numbers taken from the best authorities. Mr. De La Beche's estimate of the average thickness of this stratum is 700 feet. Dr. Conybeare considers it to range from 600 to 1000 feet. The height of the cliff at Beachy Head, which at the summit includes part of the flinty chalk, and goes down very nearly to the upper green-sand, is only 535 feet; 350 feet is the thickness of the flinty chalk at Dover. If then 250 feet are added for the remainder of that division at Beachy Head, the aggregate thickness of the chalk on the Sussex coast may be estimated at about 800 feet. At Wendover Hill, the total thickness of chalk is considered something more than 500 feet. At Diss, in Norfolk, it was found by boring to be 510 feet. The great variation in thickness is ascribed in part to the unequal removal and abrasion of the upper strata, and in part to the original inequality in the thickness of the chalk itself.

The organic remains in the chalk are usually very abundant, and are mostly marine. They consist of marine plants, lamelliferous and celluliferous corals and sponges, Asteriadae, Crinoidea, and Echinida, mesomyonous and brachiopodous Conchifera, phytiphagous and cephalopodous Mollusca, Crustacea, Fishes, Mososaurus, Chelonia. Mr. De La Beche observes, 'organic remains are in general beautifully preserved in the chalk;

substances of no greater solidity than common sponges retain their forms, delicate shells remain unbroken, fish even are frequently not flattened, and altogether we have appearances which justify us in concluding, that since these organic exuviae were entombed, they have been protected from the effects of pressure by the consolidation of the rock around them, and that they have been very tranquilly enveloped in exceedingly fine matter, such as we should consider would result from a chemical precipitate.' p. 349. *Researches in Theoretical Geology*.

Green-Sand. The general position of this stratum has been sufficiently indicated in describing the boundary of the chalk, the former outcropping round the latter in an uneven line, in some places much wider than in others.

The *Upper Green-Sand* commences immediately on the north of Copt Point beyond Folkstone, where the succession of the various beds of the system is best seen. Here the upper green-sand is of comparatively small thickness, and occupies a very narrow belt round the chalk, running in a west-north-west and then in a westerly direction, as already defined in describing the chalk boundary. It assumes a new character near Godstone, and is there more distinctly marked. The firestone obtained in that part of the country is in the upper green-sand, occupying four beds separated by seams of stratification; the thickness of the two first beds is respectively one foot nine inches, and one foot four inches; the two others are only ten inches each; this stone is extensively quarried between Godstone and Reigate. Continuing still in a narrow belt to Guildford, the upper green-sand forms a slight projection along the foot of the Hog's Back; from Farnham by Selborne and Petersfield to the south of Petworth, this stratum runs out beyond the foot of the chalk escarpment like a step or terracé. Near Petersfield it is remarkable for its width, which is there two miles, a much greater extent than at any other part. A little east of Petersfield, for a short space, this stratum entirely disappears; it then continues in a narrow belt along the north escarpment of the South Downs. This formation is but partially disclosed along the base of the central ridge of chalk in the Isle of Wight, but it is distinctly seen along the escarpments of the Under-Cliff; its step-like projection beyond the chalk, as seen in Western Sussex, is likewise observable here in several places.

In the Isle of Purbeck the green-sand runs in a narrow band on the south escarpment of the chalk, but there the separation of the upper and lower green-sands has, in a great measure, disappeared, and the latter is greatly reduced in thickness or wholly united with the upper sand. The Black Down Hills, in Devonshire, are composed of green-sand; the two beds thus united wanting the intermediate gault. These hills are distinguished by the uniform level of their summits, and, when cursorily viewed, appear to be composed of horizontal or nearly horizontal beds of green-sand, with here and there an occasional patch of chalk. It is found however that the rocks composing these hills have been fractured subsequently to their deposition, and that the valleys mostly are lines of faults, having a general northerly direction. At some parts there are faults which

do not form valleys. In a section across a southern part of the hills the chalk and green-sand seem to form a continuance; green-sand being on one side of a vertical section, and chalk on the other. In the yellowish sand, near the surface, at the Barnscombe side of the Beacon Hill, brown iron ore is found in polished fragments of very high lustre. Whet-stones are obtained from the Black Down Hills, the manufacture of which occupies a great number of the neighbouring inhabitants. The quarries are driven in direct lines into the hill, almost horizontally, about eighty feet below the top of the hill. The stones from which the whet-stones are cut are irregular concrete masses, imbedded in a looser sand, and more properly belong to the lower green-sand stratum; but the different strata of the green-sand of these hills are not distinguished by Dr. Fitton, as the gault between the upper and lower green-sand is entirely wanting. The upper green-sand is not distinctly marked in the great south-western escarpment of the chalk till beyond the Stour, from the north bank of which it extends northwards for about ten miles to Shaftesbury, and continues thence round the vale of Wardour. Or

the south side of the vale of Wardour the upper beds of this stratum are concealed at the foot of the chalk hills, but the lower beds shoot out into plateaus, which form the tops of the hills all the way from Shaftesbury along the south side of the vale of Wardour. On the north side of the vale the whole series of the upper green-sand rises abruptly, and forms a narrow ridge of unequal height. At the north of the valley this stratum appears to consist of two portions; that which immediately succeeds the chalk is the same as the firestone of Surrey; the other is equivalent to the malm-rock of Sussex, and abounds in chert. In a well sunk at Ridge the upper green-sand is distinguished into four different strata, their aggregate thickness being 100 feet. The upper green-sand is not nearly so conspicuous inland as near the coast; from the vale of Wardour it does not occur again till the vale of Pewsey. The town of Devizes stands upon a platform of the upper green-sand, which is there about 430 feet above the sea. It occurs again at Swindon, and then at Tetsworth, whence it continues in a narrow belt and in a north-east direction beyond Cambridge.

The upper green-sand consists in some places of a soft marly sand, traversed in every direction by stem-like cylinders, having within them cores of darker green matter; it also contains some irregular masses of a bright brown or orange hue, but the greater part is composed of grey calcareous marl, resembling the lowest chalk, but so thickly interspersed with green particles as to entirely assume their colour. The green particles, according to analysis, are found to consist of—

Silica	48.5
Black Oxide of Iron	22.0
Alumina	17.
Magnesia	3.8
Water	7.
Potash	traces

—
98.3

The thickness of this series near Folkstone is from 25 to 30 feet: at Godstone it increases considerably, and the depth of the wells sunk through it in the malm-rock strata of Hampshire varies from 60 to 100 feet. In Western Sussex the thickness is between 70 and 80 feet. It is about 70 feet in the Isle of Wight. The thickness of the green-sand at Black Down is about 100 feet, probably from 60 to 80 in the vale of Wardour, and from 30 to 50 near Swindon. At Cambridge it is not more than 18 inches; thence through West Norfolk the stratum is no where distinctly seen. At Hunstanton the beds which are supposed to represent it are not more than two feet thick.

Gault.—The stratum which is usually found between the upper and lower green-sand is obscured at East Weare Bay by the ruins of the superior beds, but is visible in detached points. Farther on, towards Folkstone, it becomes more marked, and forms the greater part of the cliff at Copt Point, as well as the grassy cliff between the base of the Martello tower situated in the vicinity and the sea. Thence it forms a narrow band between the upper and lower green-sand. Near Godstone it occupies a tract distinguished as 'the Black Land,' and forms a slight depression below the stratum which affords the firestone. Between Farnham and Alton this narrow belt of gault swells out to three or four times its former width, and then again narrowing continues to form a narrow band between the two strata of green-sand as far as Beachy-Head. In the Isle of Wight this stratum likewise forms a narrow band between the upper and lower sand. The gault again appears in the vale of Wardour: on the south it forms a rapid slope; on the north a depression immediately below the sand: it is here identified with that in the eastern counties by the characteristic fossils. At Ridge, near Fonthill Park, the clay of this stratum has been long used for tile-making, and it is there 75 feet in thickness. From the vale of Wardour and thence north-eastward to the sea at Hunstanton the gault everywhere appears, though it is much reduced in quantity in Norfolk. This stratum occupies a large part even of the higher grounds between Whitechurch and Wing. Immediately to the west of Hitchin and Baldock it is still wider; the towns of Shefford and Biggleswade stand on it. From Cambridge, for a few miles towards the north, it likewise occupies as great a width. In consequence of the numerous borings for water made in Cambridgeshire about this part, its relations and thickness have been well ascertained,

especially from Basingbourne through Meldrith, and thence towards Cambridge. This stratum is very distinct at Mildenhall: the blue gault has been traced as far as West Newton, about three miles south of Ingoldsthorpe. The valley between the chalk and lower green-sand is there interrupted by an advance of the chalk; and beyond that point the blue gault is no longer observable: its place is thence occupied by the red marly stratum of Hunstanton Cliff, which is a calcareous argillaceous matter, four feet thick, and it is questioned by geologists whether the term gault should be applied to it. The gault, as far as regards its composition, may be divided into two portions; the upper part, immediately succeeding the upper green-sand, contains green particles, and thence for some feet downwards it is harsh and sandy. The lower portion consists of a smooth, uniform, very plastic clay, of a light-blueish colour, which is used for tiles and common pottery. Throughout the gault, but chiefly in the lower part, concretions of iron pyrites are found, and other nodules and irregular masses. The thickness of this stratum at Copt Point is about 130 feet. At Merstham it is 150 feet thick, which is likewise the average thickness in Cambridgeshire. In the Isle of Wight it is about 70 feet; at Ridge about 75; near Thame 90 feet: at Mildenhall the blue clay is only 9 feet. Mr. Rose considers it not more than 15 feet in West Norfolk.

The Lower Green-Sand.—This stratum appears of a uniform surface, shooting out beyond the chalk in the south-east counties, and occupies a much larger area than either of the upper strata of the green-sand series. The resemblance in the aspect of the surface of the country, here occupied by the lower green-sand, to that of the Black Down Hills, in Devonshire, is extremely striking; and perhaps indicates that the description of the latter more properly belongs to this section than to that which treats of the upper green-sand stratum. The lower green-sand has three distinct subdivisions, clearly defined in most parts where it occurs. This series of strata rises gradually from Copt Point, and occupies the whole cliff west of the village; thence it is continued without interruption through Sandgate, and in the heights above Hythe. Its outcrop turns from the coast to the interior at Adlington Corner: here the subdivisions are all distinctly marked, and their respective limits defined. The lower beds, which contain much calcareous matter, are extensively worked in quarries, both for building and lime-burning, at Pluckley, on the north-west, and at Great Chart, on the south-west of Ashford, and generally along the outcrop west of Adlington Corner, where it forms a prominent ridge adjoining the valley of the Weald: here are the principal beds of stone known under the name of 'Kentish Rag.'

Extensive quarries are worked at Boughton, to the south of Maidstone. The stone for the construction of Westminster Abbey is said to have been procured here. The stone is a variety of the Kentish rag. From Adlington Corner the lower green-sand continues towards the west in a broad band varying in width; on the coast the distance from the chalk at Folkstone-hill to the outcrop of this series is about ten miles, but from Lenham to the outcrop it is not more than two. Maidstone, Sevenoaks, Godstone, Reigate, Dorking, and Godalming, stand on the lower green-sand series. Near Godstone the surface is comparatively lower, and ponds are frequent where the middle stratum occurs; the stony beds of the lowest group then rise to form the escarpment of Tilburstow Hill, which is nearly on a level with the chalk downs. At the top of the hill, the beds, which to the north of Tilburstow Hill rise uniformly at an angle of not more than 10°, are suddenly thrown up to about 45°, giving decisive evidence of an elevation from the chalk, or of a sinking towards it. Fuller's earth has been dug in this part of Surrey for a very long period; at present the neighbourhood of Nutfield is the only place in which it is got. The beds occur near the top of the lowest stratum of green-sand; in one pit near Nutfield the principal bed of fuller's earth is 16 feet thick. On the south of the Hog's-Back the lower green-sand rises, like the chalk, at a very high angle, and then, being bent suddenly in an opposite direction, is continued several miles to the south. Hindhead is the most prominent point in this part of the country, where the whole of the tract occupied by the lower green-sand is wild and barren, producing only fern, heath, and furze. Dr. Fitton remarks—'In crossing this desolate region by the main road from London to Portsmouth, it is difficult to believe that we are only forty miles distant from the

capital, and midway to one of the chief naval establishments of the empire; but the nature of the soil effectually prevents improvement, and it is not improbable that this tract may remain for centuries unchanged, and still exemplify the power of geological causes in modifying the civil condition of countries, as well as their external features.' (*Geol. Tran.*, series 2nd., vol. iv. p. 147.)

As this formation turns towards the east and continues along Sussex to the coast, it is not nearly so wide as on the north of the Weald. At Beachy Head it is three miles wide, but it is only one mile wide a little to the west of the spot where the Adur runs through it. The lower green-sand occupies a great part of the surface on the south of the Isle of Wight, and is everywhere conformable to the chalk; a ridge of highly inclined strata of green-sand crossing the island from the shore on the south of Bembridge down to the foot of Afton Down. The sands likewise form the lower ground of the interior from Mottestone through Newchurch to the coast.

A narrow belt of green-sand runs along the west and north-west of Dorsetshire. In the vale of Wardour the lower green-sand is no where prominent; but it occupies the whole of the entrance of the Vale of Pewsey, and continues, with its subdivisions well defined, through the northern counties in a north-east direction as far as the coast of Norfolk. The greatest width of the formation in this part occurs between Leighton and Ampthill in Bedfordshire, where it rises in Bow-Brickhill to the height of 683 feet above the sea. Near Woburn there is a fuller's-earth pit, the beds of which occur, like those in Surrey, near the top of the lowest division; that of the best quality is in a bed from seven to nine feet thick. The pits in this part of the country have continued to supply fuller's earth for more than a hundred years.

The three groups into which this stratum is divided, are, in most places in the south-east counties where sections have been made, well defined; and in general, in different situations where this formation occurs, the respective characteristics are found to be alike.

The first of these subdivisions consists principally of sand, white, yellowish, or ferruginous, with concretions of limestone and chert. It commonly forms a flat, but sometimes an irregularly hilly surface rising from the valley of the gault; it bears a dry barren soil. The second group contains an abundance of green matter and comparatively little stone; it is retentive of moisture, and occupies a flat and marshy tract. The third and lowest group contains more calcareous matter than the upper divisions. Where the sand of the first division emerges from beneath the gault it is often loose and of a white or buff colour; but sometimes there occurs a course from half a foot to one foot in thickness of concretions of pyrites. The middle group is characterized by a great diversity of colour and consistency which it assumes under different circumstances. When dry, the hue is frequently of a rusty yellow; but in other states it is of a dark greenish colour, and passes rapidly from the consistency of loose dry sand to a tough cohesive mass. At the very lowest part it is sometimes very marly. The fuller's earth belongs to this portion of the series, or to the upper part of the lowest division: the lower part of the latter is usually a group of stone beds, separated by yellowish calcareous sand and clay, commonly called 'Hassock.' The whole thickness of the lower green-sand on the shore between Copt Point and Hythe is about 250 feet, thus distributed—

First sub-division about 70 feet; second, from 70 to 100; and the third, from 60 to 80 feet. In western Sussex, Mr. Murchison states that nearly 400 feet of sand were bored through at Petworth; and Mr. Martin considers that the two lower members may be together about 150 feet thick. In the Isle of Wight the thickness seems to be as great as, if not greater than, that near Folkstone. At Brill, in Buckinghamshire, this formation is found to be about 26 feet; in West Norfolk, Mr. Rose estimates it at about 80 feet.

The organic remains are mostly marine throughout the whole of the green-sand series. There are marine plants, celluliferous corals, sponges, Asteridæ, Echinida, Conchifera, phytiphagous, a few zoophagous, and many cephalopodous Mollusca, Crustacea, &c.; often silicified. Numerous fossils have been found in the Blackdown Hills, usually in a state of fine preservation, principally from the loose sandy character of the matrix in which they are imbedded. The composition of the fossils is also another cause of their good preservation; with but few exceptions, the shells are converted into chalcedony, and the whole of their calcareous matter has disappeared. A very extensive

collection of fossils from these hills, formed by the late Mr Miller, is now in the museum of the Bristol Institution.

The reader may consult Greenough's and Walker's Geological Maps of England for the general distribution of the beds here described.

For the description of the chalk in Yorkshire and Lancashire, see their respective counties.

CRETE. [CANDIA.]

CRETINS, the name given in the Valais and other Alpine valleys to certain individuals who are more or less idiots, and most of whom have large swellings on their necks, called goîtres. The goître or wen is not however always a necessary sign of crétinism. Many have goîtres without being crétins or idiots; and some crétins, it is said, have no goîtres, but the latter fact seems doubtful, or at least rare. The goîtres are of all sizes, from that of a walnut to the size of a quartern loaf. There are also various gradations of crétins; those in the lowest state of idiocy cannot articulate distinct sounds, but make a sort of cry, or burst out into an idiotic laugh; they are as helpless as infants, and their intelligence seems below that of many brutes. Others are able to go about, and attend to some easy labour, and make themselves understood. They are numerous about the villages and hamlets of the Lower Valais and of the Val d'Aosta; they are not so common in the German part of Switzerland, where, in many of the valleys, they are unknown: it is said that they are not found among the natives of the higher valleys or mountains; even in the Upper Valais, east of Sion, they are rare. There has been much discussion about the causes of this infirmity: some have attributed it to the nature of the water; others, and Saussure in particular, to the stagnation of the atmosphere; for it appears to be most frequent in the low marshy spots at the bottom of valleys surrounded by high mountains, where the fresh air does not circulate freely, and where the reflected rays of the sun are very powerful in summer. The germ of the disease seems to be hereditary, though all the children of the same family are not affected by it; but there is no doubt that localities, poor diet, filth, laziness, and ignorance, materially assist its development. Since the beginning of the present century it has been observed that the number of crétins in the Valais has decreased, which is attributed to better social and domestic habits of life, to the drying up of marshes, the use of purer water for drink, and to the custom of sending children, during summer, to the upper valleys and chalets, among the Alps. The general use of coffee is also said to have contributed to it. (Walsh, *Voyage en Suisse*, vol. ii.; *Canton du Valais*). The Cagots, in some valleys of the Pyrenees, appear to be a sort of crétins.

CREUSE, an inland department of France, deriving its name from one of the rivers by which it is watered. The department is of a compact form, approaching to oval, having its greatest length N.W. and S.E. 68 miles, and its greatest breadth at right angles to the length 50 miles. It is bounded on the N. by the departments of Indre and Cher, on the N.E. by that of Allier, on the E. by that of Puy de Dôme, on the S. by that of Corrèze, and on the W. by that of Haute Vienne. Its area is about 2057 square miles: it contains 284 communes, or parishes; and the population in 1832 was 265,384, or about 129 to a square mile, being considerably below the average population of France relative to the surface. Guéret, the capital of the department, is in 46° 10' N. lat., and 1° 51' E. long. 186 miles in a straight line S. by W. of Paris, or 255 by the road through Briare, Nevers, Moulins, and Montluçon.

The department is hilly: the hills that pervade it are branches from the central mass of the Auvergnat mountains. The two principal chains of hills run nearly N.N.W. and S.S.E., and enclose between them the valley of the Creuse. This river rises in the S.E. part of the department, near the boundary which separates it from the department of Corrèze, and flows northward past the town of Fillestin to Aubusson, receiving the waters of the Roseille on the right, a little above Aubusson. From Aubusson it flows N.N.W. through the valley above described, which runs nearly the whole length of the department. Just before it enters the adjoining department of Indre, the Creuse receives on the right the Petite Creuse, or Little Creuse, which rising just beyond the north-eastern boundary of the department, in the neighbourhood of Boussac, and swelled by the waters of the Veron, flows westward into the Creuse, and on the left the Sedelle (which is aug-

mented by the waters of the Gazine and Brisentine): but neither of these streams is navigable, nor does the Creuse itself become so during the whole of its long course of from 130 to 140 miles, nearly 60 of which are within this department. It falls into the Vienne, a feeder of the Loire. The Cher, one of the principal feeders of the Loire, rises in the eastern part of the department, also the Tardes, a tributary of the Cher. On the western side of the department we have the Gartempe, the principal feeder of the Creuse (but which does not join that river until long after it has quitted the department), and the Ardour, an affluent of the Gartempe. On the south-western side there are the Maude and the Thorion, tributaries of the Vienne; and the Villeneuve, the Leyrenne, and the Visge, feeders of the Thorion. Most of the rivers which water the department on the W. and S.W. rise on the W.S.W. slope of the chain of hills which bounds the valley of the Creuse. There are small lakes at the head of the Gazine and of the Ardour.

Beside being destitute of all means of water-carriage, the department possesses very little facility for communication by land. No road of the first class touches the department at all, nor is there any of the second class, except on the west side, where about four miles of the road from Paris to Limoges are within the boundary. Of roads of the third class there are several which unite at Guéret, one from La Châtre (department of Indre); one from Dorat, and one from Limoges, (both in the department of Haute Vienne); the latter unites at Bourganeuf with one from Uzerche (department of Corrèze); one from Clermont Ferraud (department of Puy de Dôme); and one from Montluçon (department of Allier): a road of the same class leads from Aubusson to Bourganeuf, and another from Aubusson to Auzance.

The soil of the department of Creuse is very inferior, and combines with the want of the means of communication to reduce the value of the land very far below the average of France. The produce in corn (wheat, rye, barley, and oats) is small; and there is no wine made: the country is not well wooded, but there is good pasturage, in which a quantity of horned cattle and sheep (especially the latter) are fed. The mineral productions of the department have not been sufficiently attended to: there are four places in which antimony is found, but in only two have any mining operations been carried on: the coal-pits in the valley of the Creuse have been very inadequately worked; the iron ore has been neglected, and there is sandstone which would make grindstones, and granite and porphyry for building, or for ornamental works. The inhabitants are industrious, but the low rate of wages and the want of employment at home induces many to seek work in other parts. The love of their native soil however leads most of these emigrants to return home with the fruit of their labours, and purchase a patch of land, in the cultivation of which and in the bosom of their families they spend their days. These emigrants amount to about 23,000 or 24,000 yearly, about 1 in 11 of the whole population: they are mostly mechanics. Of the emigrants in the year 1825, 13,427 were bricklayers and masons, 1982 stone-cutters, 1942 carpenters, 1847 sawyers, 944 tilers and slaters, 803 flax and hemp dressers, 802 tile-makers, 545 paviors, 90 farriers, 63 plasterers, and 45 miners. The chief manufactures carried on in the department are of carpets, which are in high repute; paper, which is also in high estimation, and cotton and woollen yarn. Aubusson is the chief seat of the carpet manufacture.

The department is divided into four arrondissements, that of Guéret on the N.W., population in 1832, 89,513; that of Boussac on the N.E., population 36,738; that of Bourganeuf on the S.W., population 37,965; and that of Aubusson on the S.E., population 101,168. The chief towns are Guéret, the capital, on the hills which skirt the valley of the Creuse on the W.S.W. side, population 3100 for the town, or 3921 for the whole commune; and Aubusson, on the Creuse, population 4354 for the town, or 4847 for the whole commune. For these towns, as well as for Bourganeuf and Boussac, the other capitals of arrondissements, we refer to their respective articles. Of the other towns we subjoin a brief notice.

Felletin is on the Creuse, near its source, and not far from Aubusson. It had, in 1832, 2816 inhabitants for the town, or 3228 for the whole commune. About 300 people are employed in the carpet manufacture, in which this town almost rivals Aubusson. Coarse woollen cloths and paper are also made.

La Souterraine is near the source of the Sedelle, on the road from Dorat (Haute Vienne) to Guéret. The population in 1832 was 1647 for the town, or 2921 for the whole commune. The inhabitants are engaged in the manufacture of coarse hempen cloth.

Ahun, or Le Moutier (*i. e.* Monastère) d'Ahun, is on the banks of the Creuse, between Aubusson and Guéret: it has about 2000 inhabitants, who manufacture woollen cloth. Ahun and Le Moutier d'Ahun were originally distinct, the former being on the summit of a hill near the river, the latter at the foot of the hill and on the bank of the river. Ahun was known to the Romans by the name of Acitodunum, which name appears in the 'Theodosian Table': in the middle ages (A. D. 997) the name appears, by the title deeds of the foundation of the abbey of Le Moutier d'Ahun, to have been shortened into Agêdunum, from whence, by corruption, the modern name Ahun. Le Moutier d'Ahun derives its name from an abbey of the Benedictine order, and of the congregation of Cluny, the importance of which is indicated by the buildings and gardens which yet remain: the Conventual Church is still the resort of numerous pilgrims on the festival of St. Roch, August 16.

The other towns are, in the arrondissement of Guéret, St. Vaulry, on the road from Dorat to Guéret, with the bourgs of Bonat on the Petite Creuse, Dun-le-Palleteau, near the Bresentine, and Salagnac and La Chapelle, on the Gartempe: in the arrondissement of Bourganeuf, Benévent, near the Ardour: in the arrondissement of Boussac, Gouzon, on the road from Guéret to Montluçon, Chambon on the Tardes, and Jarnaye, with the bourg of Châtelus: in the arrondissement of Aubusson, Auzance near the Cher, Evaux near the Chacrot, and Chenerailles, on the Voult, a feeder of the Pontchauseau, with the bourgs of Mainsac, Crocq (on the Tardes), Bellegarde and La Courtine. None of these have a population of 1500 for the town or 3000 for the whole commune.

The department of Creuse is in the diocese of Limoges, which includes also the department of Haute Vienne: the bishop is a suffragan of the archbishop of Bourges. It is in the jurisdiction of the Cour Royale, or high court of justice of Limoges, and in the fifteenth military division, of which the head-quarters are at Bourges. It sends three members to the Chamber of Deputies.

CREU'SIA. [CIRRIPEDA.]

CREUTZ (Croat. Kőrös-Varmegye), a county in Croatia, adjoining south and east to the Hungarian counties of Agram and Warasdin. It has an area of about 640 square miles, and the soil under cultivation consists of about 320,500 acres, of which about 143,500 are arable land, and 31,800 vineyards. The population amounts to about 77,500. It contains 2 towns, 1 market town, 266 villages, and 4 prædia or privileged settlements. The county is mountainous and full of woods. It is watered by the Drave, Glogovnicza, Bednya, and Lesna; the lowlands are fertile, producing corn, maize, tobacco, fruit, &c., and affording good pasture for cattle. Creutz, the chief town, in 46° 1' N. lat. and 16° 32' E. long., lies in a plain, on the Glogovnicza, and is surrounded by old ramparts. It contains 637 houses and about 3100 inhabitants, and has two churches and a high-school, as well as a Græco-Catholic ecclesiastical seminary. It is the seat of a Græco-Catholic bishopric and chapter. The other town in this county is Kaproneza, in a plain on the river of that name, in 46° 10' N. lat. and 16° 49' E. long. It is defended by strong walls, and a castle, also of some strength. The number of houses is 749, and of inhabitants about 2600. It has two churches.

CREUZNACH, a minor circle in the Prussian province of Coblenz, bounded by the Rhine and Nassau on the north-east, the grand-duchy of Hesse-Darmstadt on the east, and the Rhenish possessions of Bavaria on the south. Its area is about 200 square miles; it is very hilly in the north-west, where it is traversed by the Hundsrück, but the remainder of the country abounds in pleasant and well-watered valleys. In the south and east it is watered by the Nahe and Simmerbach. The soil is in general fertile, and produces grain, wine, very fine flax, hemp, rape, and clover seed, potatoes, and fruit. Of the land under cultivation nearly 90,000 acres are arable, and the vineyards occupy about 5500. The population, which was 30,685 in 1816, and 45,754 in 1825, amounted to 47,689 in 1831. Creuznach has four towns (Creuznach about 7900; Sobernheim, 2300; Kirn, 1750; and Stromberg, 940), and seventy-nine

villages and hamlets. Great numbers of cattle are reared; the mineral productions are freestone, marble, salt, and iron.

CREUZNACH, the chief town, is situated on both banks of the Nahe, which is here traversed by a stone bridge, in the bosom of a rich and delightful country, 49° 51' N. lat., and 7° 53' E. long. It is supposed to have been the site of a Roman castrum. It is built in the old style, without any regular plan, and the streets are narrow and crooked; it has two Roman Catholic and two Protestant churches, a synagogue, gymnasium, and hospital. The number of inhabitants was 6506 in 1816, and is at present about 7900. They depend on the traffic in grain, wine, cattle, salt, flax, &c., and on their manufactures, which are chiefly leather, brandy, tobacco, and soap. There are three salt works close to the town; the 'Theodore's,' and 'Carl's Halle,' belonging to the grand-duke of Hesse, and the 'Münster-halle,' to a society at Frankfort; all of them lie on the banks of the Nahe. The Theodorshalle employs about eighty individuals, and produces annually about 1500 tons of fine salt; the other two works yield about 500 more. About two miles from Creuznach is the celebrated burgh of the Rhinegraves of Stein, hence called the 'Rheingrafenstein;' the few remains of this stronghold are situated on a rock of porphyry, which rises 600 feet perpendicularly above the surface of the Nahe, and commands a splendid view. In the vicinity of Creuznach also are the ruins of the 'Ebernburg,' on the left bank of the Alsenz, in which Bucer, Œcolampadius, and Ulrich von Hütten, with other reformers, were afforded an asylum against their persecutors by Francis of Sickingen.

CRÉVIER, JEAN BAPTISTE, born at Paris in 1693, was the son of a journeyman printer. He studied under Rollin, and afterwards became professor of rhetoric in the college of Beauvais. After Rollin's death he undertook to continue his 'Roman History,' of which he wrote eight volumes. He is less diffuse and digressive than his master, though not so pleasing in his style of composition. He also published an edition of Livy, in 6 vols., 4to., 1748, with notes. The work by which he is best known is 'Histoire des Empereurs Romains jusqu'à Constantin,' 6 vols., 4to., Paris, 1756. The author has scrupulously adhered to the antient authorities in the statement of facts, but his narrative is rather deficient in interest and force. Though not a critical work, nor entitled to a high rank, it is still a useful compilation. Crévier wrote also 'Histoire de l'Université de Paris,' 7 vols., 12mo., 1761, which is in great measure an abridgment of the larger work of Egasse du Boulay; and 'Rhétorique Française,' 1765, a good work, which has been frequently reprinted. Crévier died at Paris in December, 1765. He bore an excellent private character.

CREWKERNE. [SOMERSETSHIRE.]

CRICETUS. [MURIDÆ.]

CRICHTON, JAMES, commonly called 'The Admirable,' son of Robert Crichton of Eliock, who was Lord Advocate to King James VI., was born in Scotland in the year 1561. The precise place of his birth is not mentioned, but he received the best part of his education at St. Andrew's, at that time the most celebrated seminary in Scotland, where the illustrious Buchanan was one of his masters. At the early age of fourteen he took his degree of Master of Arts, and was considered a prodigy not only in abilities but in actual attainments. It was the custom of the times for Scotchmen of birth to finish their education abroad, and serve in some foreign army previously to entering that of their own country. When he was only sixteen or seventeen years old (the date cannot be fixed), Crichton's father sent him to the Continent. He had scarcely arrived in Paris, which, whatever may have been its learning, was then a gay and splendid city, famous for jousting, fencing, and dancing, when he publicly challenged all scholars and philosophers to a disputation at the College of Navarre, to be carried on in any one of twelve specified languages, 'in any science, liberal art, discipline, or faculty, whether practical or theoretic,' and, as if to show in how little need he stood of preparation, or how lightly he held his adversaries, he spent the six weeks that elapsed between the challenge and the contest in a continual round of tilting, hunting, and dancing. On the appointed day, however, he is said to have encountered all 'the gravest philosophers and divines,' to have acquitted himself to the astonishment of all who heard him, and to have received the public praises of the

president, and four of the most eminent professors. The very next day he appeared at a tilting-match in the Louvre, and carried off the ring from all his accomplished and experienced competitors. Enthusiasm was now at its height, particularly among the ladies of the court, and from the versatility of his talents, his youth, the gracefulness of his manners, and the beauty of his person, he was named *L'Admirable*. After serving two years in the army of Henry III., who was engaged in a civil war with his Huguenot or Protestant subjects, Crichton repaired to Italy, and repeated at Rome, in the presence of the pope and cardinals, the literary challenge and triumph that had gained him so much honour in Paris. From Rome he went to Venice, at which gay city he arrived in a depressed state of spirits. None of his Scottish biographers are very willing to acknowledge the fact, but it appears quite certain that, spite of his noble birth and connexions, he was miserably poor, and became for some time dependent on the bounty and patronage of a Venetian printer—the celebrated Aldus Manutius. After a residence of four months at Venice, where his learning, engaging manners, and various accomplishments excited universal wonder, as is made evident by several Italian writers who were living at the time, and whose lives of him were published, Crichton went to the neighbouring city of Padua, in the learned university of which he reaped fresh honours by Latin poetry, scholastic disputation, an exposition of the errors of Aristotle and his commentators, and (as a playful wind-up of the day's labour) a declamation upon the happiness of ignorance. Another day was fixed for a public disputation in the palace of the bishop of Padua, but this being prevented from taking place, gave some incredulous or envious men the opportunity of asserting that Crichton was a literary impostor, whose acquirements were totally superficial. His reply was a public challenge—the contest, which included the Aristotelian and Platonic philosophies, and the mathematics of the time, was prolonged during three days, before an innumerable concourse of people. His friend Aldus Manutius, who was present at what he calls 'this miraculous encounter,' says he proved completely victorious, and that he was honoured by such a rapture of applause as was never before heard.

Crichton's journeying from university to university to stick up challenges on church-doors and college-pillars, though it is said to have been in accordance with customs not then obsolete, certainly attracted some ridicule among the Italians, for Boccacini, after quoting one of his placards, in which he announces his arrival and his readiness to dispute extemporaneously on all subjects, says that a wit wrote under it, 'and whosoever wishes to see him, let him go to the Falcon inn, where he will be shown,' which is the formula used by showmen for the exhibition of a wild beast, or any other monster. (*Ragguagli di Parnasso*.)

We next hear of Crichton at Mantua, and as the hero of a combat more tragical than those carried on by the tongue or pen. A certain Italian gentleman 'of a mighty, able, nimble, and vigorous body, but by nature fierce, cruel, warlike, and audacious, and superlatively expert and dexterous in the use of his weapon,' was in the habit of going from one city to another to challenge men to fight with cold steel, just as Crichton did to challenge them to scholastic combats. This itinerant gladiator, who had marked his way through Italy with blood, had just arrived in Mantua, and killed three young men, the best swordsmen of that city. By universal consent the Italians were the ablest masters of fence in Europe; a reputation to which they seem still entitled. To encounter a victor among such masters was a stretch of courage, but Crichton, who had studied the sword from his youth, and who had probably improved himself in the use of the rapier in Italy, did not hesitate to challenge the redoubtable bravo. They fought: the young Scotchman was victorious, and the Italian left dead on the spot.

Soon after this the sovereign duke of Mantua engaged Crichton as companion or preceptor to his son Vincenzo Gonzaga, a young man who, according to Muratori, had shown a strong inclination for literature, but who was otherwise of a passionate temper and dissolute manners. (*Annali d'Italia*.) At the court of Mantua Crichton added to his reputation by writing Italian comedies, and playing the principal parts in them himself. His popularity was immense, but of brief duration. He was cut off in his twenty-third year, without leaving any proofs of his genius except a few Latin verses, printed by Aldus Manutius, and

the testimonials of undoubted and extreme admiration of several distinguished Italian authors, who were his contemporaries and associates. As he was returning one night from the house of his mistress, and playing and singing as he walked (for he was an accomplished musician), he was attacked by several armed men in masks. One of these he disarmed and seized: the rest took to flight. Upon unmasking his captive he discovered the features of the prince of Mantua. He instantly dropped upon one knee, and presented his sword to his master, who, inflamed by revenge, and, it is supposed, by jealousy, took the weapon and ran him through the body. Some contemporary accounts attribute his death to an accidental midnight brawl, others to a premeditated plan of assassination, but all seem to agree that he fell by the hand of the prince; and a belief, or a popular superstition, prevailed in Italy, that the calamities which befel the house of Gonzaga shortly after were judgments of the Almighty for that foul murder.

Such appear to be the well authenticated points of a wonderful story, that has often been doubted, not only in parts, but almost altogether. It has however been cleared up of late years by the industry and research of Mr. Patrick Fraser Tytler, who produces a mass of contemporary or nearly contemporary evidence. (*Life of James Crichton of Cluny, commonly called the Admirable Crichton; with an Appendix of Original Papers*, 1 vol. 8vo. Edinb. 1819.)

CRICKET, an English game of strength and activity. Formerly it was almost confined to the southern counties: Kent, Sussex, and Surrey more especially, have always been famous for skill in it. Of late years it has spread a good deal in the northern quarter of the island, notwithstanding the obstacles opposed by a wet cold climate, and the general unevenness of the ground. The rules are at once too well known and too complicated to be here explained; they are subject to variations at the pleasure of the Marylebone Club, which meets at Lord's Cricket Ground, St. John's Wood. The laws and decisions of that society are recognised by cricket-players in general, in the same way that the authority of the Jockey Club is held definitive in questions relating to horse-racing. This, which might be called our national game, has long been, and still is, cultivated with much zeal and pride: it is, we believe, of English origin, and played, almost exclusively, by the British, who have carried it into many parts of the world where the climate seems little suited to the exertion which it requires; as for example, Bengal.

CRICKHOWELL. [BRECKNOCKSHIRE.]

CRICKLADE, a market and borough town in the northern extremity of the county of Wilts, in the hundred of Cricklade. The population, in 1831, was 1506. It is situated in a level tract of country, on the south bank of the Isis, 84 miles W.N.W. from London, and 44 N.N.W. from Salisbury. The Thames and Severn canal passes near the town, and a branch canal, which forms a junction between the Wilts and Berkshire canal at Swindon, passes through it. The antiquity of Cricklade appears to be considerable. The name is derived by some writers from the British *Cerigwlad*, signifying abounding in stones. Others derive it from the Saxon *cræcca*, brook, and *lædian*, to empty, the position being near the junction with the Thames of two small streams, the Churn and the Key. An improbable story is related by several antiquarians respecting the existence of a famous school of antient learning at Cricklade, which on that account was originally called *Greeklade*; and it is added that the University of Oxford was formed by an emigration of professors and students from this town. Dr. Stukeley, in his 'Itinerary,' considers it to have been a Roman station; but this perhaps is questionable. In subsequent periods, little of historical interest is recorded, except that in 1016 the town was plundered by Canute. In the parish of St. John are the remains of a priory founded in the reign of Henry III. (*Tanner's Not. Monast.*) It is now used in tenements for the poor. There was formerly an endowed free school, but the endowment is now lost. Two national schools for girls exist, and a charity, yielding 125*l.* a year from 100 acres of land, is appropriated to the apprenticing of poor children. The town consists of two parishes, St. Mary and St. Sampson. St. Mary's church is an antient structure, with vestiges of Norman architecture; in the churchyard is a Gothic cross with canopied niches. The church of St. Sampson is a spacious cruciform edifice, and presents a fine specimen of Gothic architecture. The tower is lofty, surmounted with parapets and pinnacles, and highly

ornamented with niches and pedestals. There are two dissenting chapels, and Sunday schools supported by subscription. Cricklade has returned representatives to parliament since the reign of Edward I. In consequence of some notorious instances of bribery, the elective franchise was extended by 22 Geo. 3, c. 31, to the freeholders of several adjoining hundreds. (*Report of the Cricklade Case*, 8vo. 1785.) At present the borough is represented by two members; the number of electors is 2268; the bailiff is the returning-officer. Petty sessions are held by the magistrates once a month, and a court of requests every third Saturday. The market-day is on Saturday, and a fair is held on the 21st of September. One in April, for cattle, has been discontinued.

CRICO'PORA. [MILLEPORIDÆ.]

CRIME AND PUNISHMENT. [BECCARIA.]

CRIMEA lies between 44° 20' and 46° 10' N. lat., and between 32° 40' and 36° 30' E. long., and forms a part of the Russian government Taurida. Its figure is a quadrilateral, whose sides are respectively directed to the north-east, north-west, south-west, and south-east, and the angles to the cardinal points. From the eastern point however a peninsula stretches out between the Sea of Azof and the Black Sea, terminating on the shores of the Straits of Yenikale. On three sides the peninsula is enclosed by the Black Sea; on the north-east it is washed by the Sea of Azof. Its area may be about 8600 square miles, which is greater than that of Wales by somewhat more than a 1000 square miles. The neck of land by which this peninsula is connected with the continent is about 20 miles long. Towards its northern extremity, at Perecop (called Or-Kapi by the Tartars), it is about 5 miles across. Strabo, who is very accurate in describing this region, estimates it at 40 stadia. At this place there still remains a strong rampart, erected by the Turks, which extends from the Black Sea to the Sivash or Putrid Sea, an arm of the Sea of Azof. It consists of a deep trench, about 12 fathoms wide and 25 feet deep, which is still in good condition, and of a double wall, built of freestone, which however has been somewhat reduced by the effects of time. Five batteries are erected along this line.

Few countries, of equal extent, present a greater variety than the Crimea. The isthmus of Perecop and three-fourths of the peninsula (being the northern part) form an arid plain or steppe, which is occasionally diversified with deeper spots of ground or hollows. The soil varies in quality, but for the most part consists either of sand alone or sand combined with clay. Towards both seas there are numerous salt-lakes, some of which are from 15 to 20 miles in circuit. They are generally divided from the beach by narrow and low strips of land, and in their neighbourhood the country is of a dry, clayey, and saline nature, resembling the steppes on the Caspian Sea. The plain declines imperceptibly towards the lakes, and is destitute of water and wood; but in some parts covered with a grass sward. It is nearly uninhabited.

Along the south-eastern shores a mountainous tract extends from Cape Khersonese to Kaffa; hence to the Straits of Yenikale it is hilly. The greatest width of this tract is about the middle, where it spreads to the southern banks of the river Salgyr, about 40 miles from the coast; but its mean width does not exceed 20 miles. The whole probably does not cover 2000 square miles. That portion of this region which is to the west of the harbours of Sevastopol and Balaklava forms a peninsula called by the Greeks the Heracleotic Chersonesus, from having been colonized by settlers from Heracleia, in Asia Minor. From Cape Khersonese the country gradually rises in a sloping plain, occasionally diversified with hills; the soil is clayey, and in many parts mixed with gravel, and the surface is more or less covered with a dry turf; the higher parts are naked rocks. To the east of Balaklava the heights attain the elevation of mountains, which run like an immense wall from that town to Alushta. The coast here consists of cliffs, generally several hundred feet in height, and forming numerous headlands and dreadful precipices. At a distance of from one to two miles from the coast the mountains attain a height of 2000 feet and upwards. From this rapid slope a few torrents descend, the beds of which are filled by heavy rains or the melting of the snow. The summit of the mountains consists of extensive flats, which may be compared with the *páramos* of the Andes, and sometimes extend several miles, with occasional eminences on them. These mountain-tablelands,

called by the Tartars *Yailas*, are only visited by them during hot summers, on account of the rich pastures which they supply for cattle; some of them are covered with snow till the latter end of May. North of the *Yailas* the mountains gradually descend, forming numerous but narrow lateral ridges, which enclose delicious and sometimes wide valleys, among which that of *Baidari* has obtained celebrity from the pen of Lady Craven. The ridges by degrees sink down into hills, which terminate in the northern plain.

West of *Alushta* is the *Babugan Yaila*, which is nearly as high as the *Chatyr-Dag*, or Tent Mountain, which stands to the north-east of it, and is separated from it by a considerable depression. A like depression occurs on the east, and divides the *Chatyr-Dag* from *Temirdshi Yaila*, which is much less elevated. Thus the *Chatyr-Dag* with its flat summit appears like an immense table, and on that account is probably called by *Strabo Trapezus*. (vii., 309, Casaub.) On its flat summit rise several eminences, like a tent, from which the name is derived, which is given to the mountain by the Tartars. These summits, which rise 5040 feet above the level of the sea, are the highest mountains in the Crimea. The *Chatyr-Dag* and the eastern chain, which extends to *Kaffa* from the *Temirdshi Yaila*, are more distant from the coast than the western chain, and a number of small streamlets descend from the heights and drain some fine valleys along the sea-coast. Towards *Kaffa*, the mountains decrease in elevation, and terminate about a mile from the western shores of the open bay on which that town is built.

The country between the bay of *Kaffa* and the *Sivash* or Putrid Sea, is a plain very slightly undulating, but it becomes more so in proportion as it proceeds to the east. Near the banks of the strait of *Yenikale* at *Kertsh*, the country is traversed by several ridges running nearly south and north, on which numerous craggy points rise to 300 or 400 feet above the sea. Near that town and between it and *Yenikale*, the peninsula terminates with a rocky though not an elevated shore. This peninsula between the Black Sea and the Sea of Azof is remarkable for its mud volcanoes; of which *Pallas* particularizes the hill called *D'shtube*, situate nearly in the centre of the peninsula. In some parts naphtha or petroleum is found.

From this peninsula extends in a north north-west direction a narrow strip of land, which divides the *Sivash* or Putrid Sea from the Sea of Azof. It is on an average hardly 300 yards wide, upwards of 70 miles long, and very low; it consists towards the south of shelly sand, in which some scattered plants thrive with luxuriance, but farther on the soil exhibits only common sand, more or less consolidated, and of a saline nature. It contains several small salt-lakes, and along its low beach heaps of salt are thrown out by the sea. This narrow tongue, called the isthmus of *Arabat*, is divided from the *Nogay-steppe* by a narrow strait, called the strait of *Ienitshe* or *Tonke*, and is inhabited only by a few innkeepers; the peasants of eastern Russia bring provisions along this tract to *Kaffa*, and take back fish.

Numerous rivulets descend from the northern declivity of the mountains, and form several rivers, as the *Katshka*, *Alma* and *Salghyr*, all of which have very broad beds, though in summer they contain very little water and run slowly. But when the snow melts on the *Yailas*, they become rapid, broad and deep rivers.

The winters are cold and the summers hot. In very severe winters the mercury sometimes sinks 9° below zero, and not only the whole Sea of Azof, together with the straits of *Yenikale*, but also a great part of the bay of *Kaffa* is covered with ice strong enough to support men on foot and on horseback. The climate is so unsettled, that it often varies six or eight times in twenty-four hours. The winds are very variable, and bring rain from the west and south-west, mild air and frequent mists from the south, serene dry weather from the east, and cold from the north. In spring the weather is settled, the heat moderate and refreshing, and the nights cold and serene; there is seldom any rain, especially during the prevalence of violent east winds; and unless a considerable fall of rain happens in April and May, an unproductive harvest frequently follows. In summer the thermometer frequently rises to 98°, 100° and even 102°. On the same day, however, it falls sometimes 20° or even 30°. Droughts frequently prevail for several successive years, and dry up the wells and brooks. Few summers pass in which the verdure on the hills is not parched up. Thunder-storms rarely occur, but they are tremendous, and sometimes accompanied by hail-stones and destructive

water-spouts. In summer and spring rainy weather seldom continues for twelve or twenty-four hours. In autumn bilious fevers prevail. Cold days occur in the middle of October, and are generally accompanied with night frosts, but afterwards the weather again becomes pleasant, and frequently continues mild till December and January.

The crops cultivated in open fields are wheat, rye, barley, oats, maize, spelt, millet, chick-peas, flax, and tobacco. In the gardens are raised melons, water-melons, cucumbers, gourds, artichokes, cabbages, onions, garlic, leeks, brocoli, celery, parsley, carrots, and red beets. The numerous and extensive orchards in the valleys produce pears, apples, quinces, plums, cherries, peaches, apricots, almonds, medlars, pomegranates, mulberries, and nuts. Some of these trees grow also wild on the declivities of the mountains. The forest trees, which cover a great portion of the declivities of the mountains, especially on the northern side, are oak, beech, elms, poplars, lime-trees, maples, ash, and pines (*pinus maritima*). Of late, great attention has been paid to the cultivation of the vine, of which *Pallas* enumerates twenty-four kinds. But though many of these grapes are good, the wine is still much inferior to that which is produced in Hungary and France. The camel with two bunches is more numerous than is commonly supposed: there are several thousands of them. Great attention is paid by the Tartarian noblemen to the breeding of horses, and they are of a good kind. Those of the mountainous districts are small, but uncommonly hardy and sure-footed. The horned cattle are of a middling size in the plains, and small in the mountains. There are three varieties of sheep, all of which have a long tail, which for half its length is overgrown with fat and covered with coarse wool. One variety, which pastures on the plain lying along the Black Sea between *Koslof* and *Perecop*, produces the celebrated Crimean lamb-skins, of which more than 30,000 are sometimes annually exported to Poland and Germany. Of black lamb-skins more than 50,000 or 60,000 are annually exported. The mountain sheep are smaller, but celebrated for their soft fine wool.

Sturgeons are taken on the shores of the Sea of Azof, in the straits of *Yenikale*, and in the bay of *Kaffa*. Caviar is made, and also a little isinglass. Salt, which is the only mineral that is abundant, is found at the bottom of the salt lakes during the summer heat. Besides the salt lakes on the plain, there are some others on the eastern peninsula. Salt in great quantities is exported to Southern Russia, and much is also shipped to Anatolia and Turkey from the ports of *Kertsh*, *Kaffa*, and *Kolof*.

The population of the Crimea falls somewhat short of 300,000. More than two-thirds of its inhabitants are a mixture of Mongols and Turks, and are called Tartars. Those who live on the plain show in their features their Tartar origin; but those in the northern valleys display a strong mixture of Turkish blood, especially the noblemen (*murses*), in whom the Tartar features are entirely obliterated. Besides the Tartars, different other nations are found, Russians and Germans, who have been transplanted in modern times as colonists, and Greeks, who always seem to have formed a portion of the population, but have considerably increased in latter times.

In the interior, at the northern extremity of the hilly country, is the town of *Simferopol*, or *Akmeshed*, the capital, not far from the sources of the river *Salghyr*, with 3000 inhabitants, and that of *Karasubazar*, with 3700 inhabitants, and some manufactures of morocco and leather. In the mountains is the town of *Baktchissarai*, the antient residence of the khan. [BAKTCHISSARAI.]

The most frequented harbours are on the south-western coast. *Koslow* or *Eupatoria*, with 4000 inhabitants, mostly Tartars and Jews, and a fine mosque, exports salt to Anatolia and Turkey. *Sevastopol*, formerly *Akthiar*, with 3000 inhabitants, is a station of ships of war. On the south-eastern coast is *Balaklava*, with a fine harbour, between high mountains, which however is not much used, and *Kaffa*. [KAFFA.] On the straits of *Yenikale* is *Kertsh* or *Kiertsh*, a thriving place, with more than 4000 inhabitants. It exports salt, salted fish, and caviar. In its neighbourhood are the extensive ruins of the antient town of *Panticapaeum*, once the residence of *Mithridates*. *Yenikale*, at the entrance of the strait, is a small fortress, with 600 inhabitants. The fortress of *Perecop*, on the isthmus, has 800 inhabitants.

Manufacturing industry is confined to the preparation of

leather and morocco in Baktshissarai, Karasubazar, and Koslof, and to cutlery and sadlers' and shoemakers' work at Baktshissarai. In some places coarse earthenware is made. The Greeks in the neighbourhood of Kaffa extract soda from some saline plants.

The chief exports of the Crimea by sea are salt, wheat, soda, butter, and hides: the imports, raw and manufactured cotton of different kinds; silk stuffs of various patterns and in the eastern fashion; wines of the Archipelago, and the straits of Constantinople; brandy, Turkish leaf-tobacco, and a variety of fresh and dried fruits. To Russia are sent, chiefly by the way of Perecop, salt, grey and black lamb-skins, sheep's and bullocks' hides, wool, camels' hair, leather, hare-skins, wines, walnuts, fruits, together with the dry fruits imported from other parts, and fish. The imports are grain, provisions, iron, and different manufactured goods of Russia.

The Greeks became early acquainted with this peninsula, probably soon after the Ionian Greeks and especially the inhabitants of Miletus had begun to form settlements on the northern shores of Asia Minor, about six centuries before the Christian æra. Panticapæum is called by Strabo a colony of the Milesians. Besides this place they built Theodosia, now Feodosia or Kaffa, and some other places on the peninsula forming the west side of the strait of Yenikale. They preferred this part of the peninsula, from its containing a large tract fit for agriculture, and producing very rich crops—Strabo says thirty times the seed. It was at one time considered the granary of Greece, especially of Athens, whose territory being of small extent and of indifferent fertility, was unable to maintain its great population by its own produce. At one time Athens annually imported from the Crimea between 300,000 and 400,000 medimni of grain, as Demosthenes informs us, in his Oration against Leptines (c. 9). Strabo says, that in one year the Athenians received 2,100,000 medimni from Theodosia, but the text is evidently corrupt. [BOSPORUS.]

(Strabo, vii.; Pallas; Lyall's *Travels in Russia*; Captain Jones's *Travels in Norway, Sweden, Finland, Russia, and Turkey*.)

CRINOI'DEA. [ENCRINITE.]

CRIOCE'RIDÆ (Leach), a family of Coleopterous insects, of the sub-section Eupoda and section Tetramera, distinguished by the following characters:—mandibles truncated at the apex, or presenting two or three notches: labium generally entire, or but slightly emarginated: antennæ of moderate length, filiform, somewhat thickened towards the apex; the joints mostly of an obconic form; tarsi with the penultimate joint bilobed; femora often thick, especially towards the apex.

The principal genera contained in this family are—*Donacia*, *Hæmonia*, *Ptauristes*, *Crioceris*, *Zeugophora*, *Auchenia*, and *Megacelis*.

The species of the genus *Crioceris* have the posterior femora of the same thickness as the others: the antennæ gradually enlarged towards the apex, the joints of which are scarcely longer than broad; the eyes are emarginated on the inner side: the thorax is narrower than the elytra, short, and usually of a somewhat cylindrical form: the elytra are elongate.

About eight species of this genus have been found in England, of which the most common is the *Crioceris Asparagi*, sometimes called the Asparagus Beetle, which is nearly a quarter of an inch in length, and of a blue-black colour; the thorax is red with two black spots; the elytra are yellow, with the suture, two transverse bands, and a spot at the base, black.

This pretty little beetle is found in abundance in the south of England, on asparagus plants: the larvæ are of a greenish hue, resemble little masses of jelly, and inhabit the same situations as the perfect insect; they subsist upon the leaves and soft part of the stalk of the asparagus plant.

CRISTELLA'RIA. [CEPHALOPODA, vol. vi., p. 426.]

CRITICISM. Literary and scientific controversies, like the vexatious disputes of common life, arise more frequently from verbal than real causes. These quarrels generally originate in words which, notwithstanding the sameness of their sounds, have different significations and different values; or perhaps, to speak more correctly, are conceived in different senses by the disputants. This arises from the

fact of few words being universally understood in the same sense. Almost every person affixes his own particular meaning to the words 'virtue,' 'right,' 'religion,' 'idea.' The word 'criticism' is not exempt from a similar difficulty. Criticism with some is synonymous with censure: others have a different notion of the word. Criticism properly means an impartial judgment of a subject, the element of the word signifying, in its original language, the Greek, *to separate, to distinguish, to judge*. As many objects as there are in the world, so many kinds of criticism must there necessarily be. Besides philological criticism, the object of which is to discover erroneous readings in texts, to remove interpolations from them, to restore to its pristine purity the original text of authors, and to investigate the style, there is, 1st. General criticism, such as occurs in impartial accounts of works in reviews, magazines, and other literary productions; 2nd. Æsthetical criticism; 3rd. Historical criticism; 4th. Philosophical criticism.

With respect to criticism and to the art of disputation, as well as the ordinary disputes and differences of life, the following remark may be worth consideration as tending to unite criticism, as a species of wisdom, with one of the greatest virtues, toleration. Every subject or object ought to be considered in two different ways: first, abstractedly or as regards itself; secondly, in connexion with other subjects or objects: the former is the absolute, the latter the relative point of view. A Hottentot beauty, regarded only in the first mode, might safely be pronounced ugly; but were the human race entirely composed of Hottentots, such a beauty would be considered a master-piece of creation, notwithstanding the resemblance of her physiognomy to that of a monkey. The writings of the antient philosophers are of comparatively little value in themselves, but considered relatively, they are admirable and everlasting monuments of the human intellect of those remote ages. An intelligent critic therefore never forgets both modes of viewing the subject under investigation; and thus *criticism* is opposed to *controversy*. First principles, in which both author and critic coincide, being agreed on, the matter only has to be examined: thus in a criticism of Oken's *Natural Philosophy*, the premiss to be granted would be that in the beginning nothing existed but æther, out of which by degrees everything arose. In poetry it is requisite to ascertain the object of the author, whether the poet meant, as with Crabbe, Goethe, &c., to portray human life under this or that aspect; or, as with Schiller, &c., to delineate the ideal. Criticism thus understood will not degenerate into a mere captious habit of finding fault, nor will disputation assume the appearance of a quarrel.

In philosophy the word 'critical' signifies that method of reasoning which is opposed to 'dogmatism.' A dogmatist maintains an assertion without proof; the critical inquirer not only endeavours to prove every assertion which he makes, considering fully both sides of the subject, but also commences his investigation by an analysis of the powers of the human mind, in order to ascertain what can be known and what cannot. Upon this principle Kant's celebrated work, '*Kritik der Reinen Vernunft*,' or '*Criticism of pure Reason*,' was written.

Criticism must not be confounded with scepticism, the object of which is to show that truth is not attainable by philosophical inquiry.

CROATIA, called by the natives 'HORV'ATH ORSZAG,' comprising several countries and districts in the southern part of Austria, has the title of kingdom, though the greater part is now incorporated with that of Hungary, of which it forms the south-western division. It lies between 44° 5' and 46° 25' N. lat., and 14° 20' and 17° 25' E. long., and extends in a north-easterly direction from the shores of the Adriatic to the banks of the Drave (Drau) and Save. It is bounded on the north by Lower Styria and Hungary; on the east by Slavonia; on the south by Turkish Croatia and Dalmatia; and on the west by the kingdom of Illyria. Croatia has the following subdivisions:

	Square miles.	Inhabitants.	Capital.
N.W. The county of Agram.....	873	385,000	Agram (capital of Croatia.)
N. The county of Warasdin ...	718	126,000	Warasdin
N.E. The county of Creutz	634	77,600	Creutz
W. The litorale of Hungary ...	130	27,600	Fiume
S. The military frontiers	5754	459,700	Zeugg
E. The generalate of Warasdin	1415	111,000	Bellovar
	9524	1,186,900	

Croatia contains 7 towns, 16 market-towns, 1680 villages, and 7 prædia.

The surface of Croatia is extremely irregular. It is traversed by chains of mountains, chiefly continuations of the Julian Alps, is intersected with deep valleys, and also contains extensive plains. The loftiest ridge, that of the Velebich, is in the southern part of the country, and extends for about 70 miles from Zernanya to Zeugg. Its general altitude is from 3000 to 4000 feet: its highest summits are the Badany, which is 4164 feet, and the Velika Viszochicza, 4338 feet above the level of the sea. The second chain, called the Capella, likewise commences in the south-western extremity of Croatia, and runs towards the north-east to the banks of the Unna: it exceeds the Velebich both in breadth and length, being above 80 miles long; and the elevation of its highest summit, the Plesioicza, on which the snow scarcely melts throughout the year, is more than 5550 feet above the sea. The mountains which compose the chain from the banks of the Kulpa to those of the Unna are much lower and less rugged. Towards the Save they gradually decline, and at its confluence with the Kulpa terminate in a plain.

The greater part of these mountains consist of limestone, with various kinds of beautiful marble, porphyry, serpentine, &c. which furnish excellent materials for building; all the bridges and parapets of the great 'Josephine Road,' and most of the houses at Fiume, Zeugg, and Porto Ré, are constructed with this stone. The most common is a blackish grey marble, which emits a fetid smell on being rubbed, and when portions fall down from the mountains, diffuses a highly offensive odour throughout the neighbourhood.

Many of the valleys, especially on the southern ridge, are entirely closed, and the streams which traverse them, not having a vent, find their way to different rivers by subterraneous channels, and often inundate the surrounding country. Among the most striking of these valleys are those of Korbavia and Licca, which are inhabited by a half-savage race, and abound in picturesque waterfalls. The Szluinchicza forms above forty beautiful cascades.

Besides its two boundary rivers, the Drave and the Unna, Croatia is watered by many other rivers and streams, of which the Save only does not rise within its confines; the others take their rise in the country; such as the Kulpa, Longa, Krapina, Korana, Odra, &c. nearly all of which flow into the Drave or Save, except the Zernanya and Fiumara (or Reka), which fall into the Adriatic. Croatia contains many mineral springs, which possess medicinal properties. It is however poor in metallic ores, except iron-stone, which occurs in great abundance in several places. Copper has been obtained for centuries near Czambor, the mines of which yield annually about 400 tons. Coal is found in various parts; as well as sulphur, lead, salt, &c.; occasionally also silver; gold is obtained from the sand of several of the rivers, especially the Drave.

The climate of Croatia varies considerably in different parts. The southern and more sheltered districts, such as those of Zernanya, and the narrow tract between the mountains and the coast about the gulf of Guarnero, which are defended against the north wind, enjoy an Italian climate, and produce the olive, fig, grape and almond. Here the vintage takes place in August, but in the western highlands beyond the Kulpa, the harvest does not commence till the end of August or beginning of September, when the snow begins to fall, which does not melt till April or May. On the higher summits it frequently lies the whole summer. But even in the southern regions, the winter is very severe, owing to the vicinity of the high Alps.

The scourge of this country is the wind called Bora or Bura, which blows from the north or north-east, and generally sets in between seven and eight A.M. and ceases at four or five P.M. It is accompanied by excessive cold, and blows with such violence that large stones are carried by it to a great distance. Malte Brun says that the district of Rudaicza is rendered uninhabitable and nearly inaccessible by it. There is also a very hot south or south-west wind, called Jug, which blows from Africa, but does not set in at any stated times.

The eastern and northern parts of Croatia, which are more level and less mountainous, and especially the parts watered by the Drave and Save, are very fertile in various kinds of grain, particularly barley, maize, and oats; the soil is also very favourable for fruits, among which the Damas-

cene plum furnishes the favourite drink of the Croats. Croatia has immense forests of oak and beech. Flax, hemp, and tobacco are only grown in sufficient quantity for domestic consumption. Croatia produces about 3,700,000 metzen of various sorts of grain, and about 400,000 kilderkins of wine. Horticulture and gardening are very little attended to; the same may be said of the rearing of horned cattle and horses, except in the counties of Agram and Warasdin. The flocks are neither numerous nor of choice breeds; but an establishment for the improvement of sheep of superior wool has lately been formed at Merkopalj, which promises to be successful. Considerable herds of swine are reared, for which the forests afford plenty of food. There are likewise extensive fisheries; and much wax and honey are produced. Timber is obtained in abundance, as the whole country abounds in forests. Only a very small portion of the inhabitants are engaged in manufactures, and these are of the rudest description. As Croatia does not raise more produce than suffices for its inhabitants, its commerce is chiefly confined to the transit trade. The three great roads for trade are the Louisa, from Fiume to Carstadt, and the Caroline and Josephine, leading into Illyria and Bosnia.

The inhabitants profess the Roman Catholic and Greco-Catholic religions. The adherents of the former are under the bishop of Agram, one of the richest prelates of Hungary, and those of the latter have their own bishop, who resides at Creutz. The public system of education is that of the national schools, which are divided into elementary, head, and normal. There are two gymnasia at Agram and Warasdin, and a superior academy or college at Agram, which has also a seminary of theology for candidates for orders in the Roman Catholic and Greco-Catholic church.

The Croatian language is a dialect of the Slavonian; it nearly resembles the Bohemian and Moravian, and of all the Illyrian languages bears the greatest affinity to the Polish.

The antient inhabitants of Croatia were the Pannonians, after the conquest of whom by Augustus it became a province of Illyria. The Goths took possession of it A.D. 489, then the Avars or Abares, and in 640 the Croats, a tribe of the Wends from Bohemia, who were antiently called Horwather, Hrowathes or Chrobates, settled in it, and gave their name to the country. They subdued the former inhabitants of Illyria and Noricum, and being reinforced by bodies of their countrymen, they founded the Duchies (or in their idiom *Zupanies*) of Carinthia, Friuli, Liburnia, or Croatia Proper, Jadra in Dalmatia, Slavonia, &c. These small states submitted to Charlemagne, but they generally allied themselves with the Greek emperors, although they continued to acknowledge the supremacy of the church of Rome. Their first Archizupan of whom history makes mention, is Crescimer, who lived in the tenth century, and whose son Dircislav I. took the title of king of Croatia, which then extended over the western part of Dalmatia and Bosnia; its capital, called Biograd, appears to have been situated on the shores of the Adriatic, at the place called by the Venetians Zara Vecchia, although Büsching and some other authorities fix upon the modern Biograd, Belligrad, or Bielgrad, on the small river Pliva, as its site. Towards the year 1100 Croatia was incorporated with Hungary.

After the middle of the fifteenth century it suffered greatly from the incursions of the Turks, but the Croats being a warlike people, ravaged in their turn the Ottoman territories, and returned to their villages laden with spoils. Croatia was afterwards annexed to the Austrian empire, and, together with Slavonia, Dalmatia, and some parts of Hungary, was governed by a special board at Vienna under the common title of States of Illyria. More recently Croatia has preserved the name only of a kingdom, Agram, Warasdin, and the Litorale having been incorporated with Hungary, and the Generalats of Creutz and St. George with the Military Frontiers, having each of them its distinct military jurisdiction.

Although brought into more regular discipline by the Austrian government, the Croats still retain their taste for war. Those who live at some distance from the Turkish frontiers have adopted more industrious habits. Their untutored state is accompanied by many traits of virtue and generosity, and great fidelity to their sovereign. Notwithstanding their revolt against Austria in 1755, on account of certain innovations, their despair was indescribable when they found themselves united to France in 1809. Their dwellings are merely large barns, without either win-

dow or chimney, where the family and the swine lodge under the same roof.

CROCKET, an ornament of very frequent use in Gothic architecture. It consists of leafy buds growing out of the angular sides of pinnacles and the label moulding of windows and doors. There are no examples of crockets in the Norman or arched style. In the early pointed style they are meagre, as in Lincoln cathedral, but afterwards they become fuller, and a more natural representation of a bursting bud. The later examples however are larger, and have not so much the appearance of nature.

CROCODILE, **CROCODILE-TRIBE**, **CROCODILIDÆ**, a family of *Saurians*, comprising the largest living forms of that order of reptiles. Duméril and others distinguish the family by the appellation of *Aspidiot* (shielded) *Saurians*; while many modern zoologists have considered them as forming a particular order. They form the *Loricata* of Merrem and Fitzinger, and the *Emydosaurians* of De Blainville.

Cuvier in his '*Règne Animal*' describes the peculiarities of the family. The tail is flattened at the sides; there are five anterior and four posterior toes, of which the three inner ones only on each foot are armed with claws; all the toes are more or less joined by membranes. There is a single row of pointed teeth in each jaw, and the tongue is fleshy, flat, and attached very nearly up to the edges, which made the ancients believe that the crocodile wanted that organ. The intromittent male organ of generation is single; the opening of the vent longitudinal. The back and tail are covered by great and strong squared scales, elevated into a ridge on their middle. There is a deeply denticulated crest on the tail, at the base of which the crest becomes double. The scales of the belly are squared, delicate, and smooth. The nostrils are opened at the end of the muzzle by two small crescent-shaped slits, closed by small valves, and lead by a long and straight canal pierced in the palatine and sphenoidal bones to the bottom of the back part of the mouth. As the lower jaw is prolonged behind the skull, the upper jaw has the appearance of mobility, and so the ancients wrote; but it only moves in concert with the whole of the head. The external ear is shut at will by means of two fleshy lips; and the eye has three lids. Under the throat are two small glandular orifices, whence issues a musky secretion.

The vertebrae of the neck bear upon each other by means of small false ribs, which render lateral motion difficult. Crocodiles, therefore, change their direction not without trouble, and they may be easily avoided by doubling, and escaping while they are employed in the laborious operation of turning round. They have no true clavicles*; but their coracoid apophyses are attached to the sternum, as in all the other *Saurians*. Besides the ordinary and the false ribs, there are a set which protect the abdomen without reaching up to the spine, and which appear to be produced by the ossification of the tendinous portions of the *recti* muscles. Their lungs are not sunk in the abdomen like those of other reptiles, and there are fleshy fibres adhering to the part of the peritoneum which covers the liver, and which present the appearance of a diaphragm, which, joined to their trilocular heart, where the blood which comes from the lungs is not mingled with that venous portion of it which comes from the body so completely as it is in the other reptiles, slightly approximates the crocodiles to the warm-blooded quadrupeds. The auditory bone (*caisse*) and the pterygoid apophyses are fixed to the skull as in the tortoises.

The eggs of the crocodiles are hard, and as large as those of the goose†; and these reptiles are considered to be animals in which the extremes of size, taking that of the newly-hatched young and that of the full grown adult as the most remote points, present the widest difference‡. The females guard their eggs, and when they are hatched take care of the young during some months. (Cuvier.)

The dentition of the crocodiles is peculiar. The teeth are numerous, large, of unequal length, conical, hollow at the base, disposed in a single row, and planted in the thickness of the edges of the superior and inferior maxillary bones, in separate cavities which may be considered as true alveoli. These teeth are hollowed at the base in such a manner as to serve for the case or sheath of the germ of

* Cuvier observes, that they are the only *Saurians* which want the clavicular bones.

† But they are of a different shape, oblong rather than oval.

‡ An observation made by Herodotus, ii. 68.

the tooth destined to replace it, and which is to be of greater volume; so that, in crocodiles, the number of the teeth does not vary with age as in many other animals.

[Tooth of crocodile, showing the incipient absorption of the hollow basal cone from the effect of the rising pressure of the advancing tooth.]

Great solidity and strength are the results of this double *gomphosis*, and the *alveoli* are moreover directed obliquely from front to rear. The bony edges of the jaws whence these insulated teeth spring, are covered by a kind of gum. Another peculiarity of admirable adaptation to the necessities of the animal, may be observed in the interior of the mouth of the crocodiles. Their palatine vault is nearly flat, and is not pierced by the extremities of the nasal *fossæ*, as in the majority of other reptiles. The posterior nasal apertures open in the *pharynx* behind the *velum palati*, which is sufficiently long to overspread that portion of the roof which is in front of the orifice of the *glottis*. They are probably the only reptiles which have a true *pharynx*, that is to say, a vestibule common to the posterior nostrils, the mouth, the *larynx*, and the *œsophagus*. This conformation, joined to the muscular structure of the tongue, and a peculiar expansion of the body of the *os hyoides*, produces a kind of cartilaginous disk or valve, which can be raised and applied to the *velum palati* above, so as to protect the *glottis*, to which it serves the office performed by the *epiglottis* in mammals, while it confers on the reptile a peculiar power of deglutition and respiration, of the greatest consequence to its economy when it is below the surface of the water and has seized its prey in that situation; or, when the muzzle alone is above the surface, in carrying on respiration.

The following is a summary of the

Character of the Family.—*Body* depressed, elongated, protected on the back with solid and carinated scutechons or shields; *tail* longer than the trunk, compressed laterally, annulated, and furnished with crests above; *feet* four, short, the toes of the *posterior* feet united by a natatory membrane: each foot with three claws only; *head* depressed, elongated into a muzzle, in front of which are the *nostrils* approximated upon a fleshy tubercle, furnished with moveable suckers (*soupapes*): gape of the mouth extending beyond the skull; *tongue* fleshy, adherent, entire, not protractile; *teeth* conical, simple, hollowed at the base or towards the root, unequal in length, but placed in a single row; *male genital organ* simple, having its exit from the *cloaca*, which opens longitudinally. (Duméril et Bibron.)

From the first cut in the following page a general knowledge of the osseous structure of the crocodiles may be derived; and, from the second, a fair notion of the external appearance of the adult reptile.

Geographical Distribution.—Of the three genera or subgenera which compose the family, no living species is found in Europe,* nor has any been yet detected in Australasia. The first of these genera, *Alligator*, is peculiar to America; the second, *Crocodilus*, is distributed in the Old and New World; and the third, *Gavialis*, seems to be limited to the Ganges, and the other large rivers of Continental India.

Asia, besides the Gavial of the Ganges, produces at least three true crocodiles, viz., *Crocodilus vulgaris*, *Crocodilus Galeatus*, (*C. Siamensis*, Schneid.; *C. Siamensis*, Gray?) and *Crocodilus biporcatus*. Siam seems to be the principal, if not the only locality, where the first of these has

* Malte Brün (*Syst. Géog.*, vol. viii., p. 198) states, that a crocodile is still preserved at Lyons that was taken from the Rhone about two centuries ago; but as Mr. Lyell observes, no particulars are given

[Skeleton of Alligator Lucius.]

[Trunk of the same : ventral aspect.]

[Alligator Lucius.]

[Outline of the head and anterior parts of Alligator Lucius seen from above.]

been found; while the other two appear to be natives of those rivers which have their mouths in the Indian Ocean and the Ganges.

Africa, where neither Caimans (*Alligator*) nor Gavials have yet been discovered, is the native country of the *Crocodile à bouclier*, and *Crocodilus vulgaris*: it may also be the locality of *Crocodilus planirostris* of Graves and of Gray (*Crocodilus Gravesii*, Bory de St. Vincent); and *Crocodilus intermedius* of Graves and of Gray (*Crocodilus Journei*, Bory de St. Vincent), though their geographical

position does not seem to be determined: these may perhaps come from the coast of Guinea. The only part of Africa whence the *Crocodile à bouclier* has been received is Sierra Leone; while *Crocodilus vulgaris* seems to be spread over the whole of Africa, and is also an inhabitant of Madagascar. Numbers have been taken in the Nile, and one in the river Senegal. (Duméril et Bibron.)

America is most fruitful in crocodiles, and possesses more species than Asia and Africa put together, seven in all, viz., five species of *Alligator*, and two of *Crocodilus*. True crocodiles have never been detected on the Continent. *Crocodilus acutus* has been found at Martinique and St. Domingo, and *Crocodilus rhombifer* at Cuba. The northern part of America is inhabited by one species only, *Alligator Lucius*, while four species, viz., *Alligator palpebrosus*, *Alligator Sclerops*, *Alligator punctulatus*, and *Alligator cynocephalus*, inhabit the south. (Duméril et Bibron.)

The late Mr. Bennett, in September, 1835, called the attention of a meeting of the Zoological Society to a specimen of a crocodile which he had regarded, while it was living in the Society's Gardens, as referrible, on account of the length of its head and the extent of the shielding at the back of its neck, to *Crocodylus cataphractus*, Cuv. A more close examination of it, however, subsequently to its death, had shown him that its head was still more prolonged than that part is described to be in *Crocodylus cataphractus*, its length being to its breadth as 3 to 1, instead of as $2\frac{1}{2}$ to 1: it was also deficient of the second post-occipital series of four small plates noticed as occurring in *Crocodylus cataphractus*, and he characterized the species under the name of *Crocodylus leptorhynchus*. It came from Fernando Po, and Mr. Bennett observed, that notwithstanding the approximation of this species to the Gavials by the elongation of its jaws, and by the extent to which the back of the neck is protected by bony plates, it has all the essential generic characters by which the crocodiles are distinguished. The two posterior pairs of nuchal plates were much smaller than the two pairs anterior to them. (*Zool. Proc.*, 1835, part 3.)

Habits, Reproduction, &c.—Cuvier says that the *Crocodylidae* inhabit fresh water, that they cannot swallow while in the water, but drown their prey, and place it in some nook under water, where they suffer it to putrefy before they eat it. This account seems to require some modification. Mr. Lyell, in his 'Principles of Geology,' observes that the larger Gangetic species descends beyond the brackish water of the Delta into the sea: and other instances are recorded of the true crocodiles (but not of the alligators) frequenting the mouths of large rivers, and even passing between different islands at considerable distances from each other. (*ALLIGATOR*, vol. i. p. 350.) This should be remembered by geologists. Then, as to their inability to swallow while in the water, those authors who describe their collective fishing expeditions, entirely contradict it. True it is, according to them, that the alligators, after they have seized the fish from below, rise to the surface and toss the fish into the air to get rid of the water which they have taken in with it, catching it again in its descent: but it is clear that they swallow it without resorting to the land, though they go thither for the purpose of devouring those land animals which they have succeeded in capturing and drowning, after they have undergone some degree of decomposition. This mode of proceeding, and a general view of the habits of the Caimans, which may be taken as an example of those of the whole tribe, is stated in the article *ALLIGATOR*, in the first volume.

We here subjoin some information from an eye-witness, M. Ricord, as to the mode of reproduction of the crocodiles of St. Domingo, and transmitted by him to MM. Duméril and Bibron. 'L'accouplement m'a semblé se faire de préférence au bord de l'eau; la femelle se place sur le côté, et tombe quelquefois sur le dos, ainsi que j'ai pu le voir une fois; l'intromission dure assez long temps, puis ils se plongent tous deux dans l'eau.' 'The laying of the eggs takes place in April and May, and the number amounts from twenty to twenty-five, more or less, laid at many times. The female deposits them in the sand with little care, and scarcely covers them. I have met with them in the lime which the masons had left on the bank of the river. If I have reckoned right, the young come forth on the fortieth day, when the temperature is not too cold. At their birth they are five or six inches in length. They are hatched alone, and as they can do without nourishment while coming out of the egg, the female is in no haste to bring it to them: she leads them towards the water and into the mud, and disgorges for them half-digested food. The male takes no account of them.' The young preserve for some time the umbilical mark or cicatrice on the abdomen, whereby the vitellus was absorbed.

Position in the animal series. The *Crocodylidae* are generally considered as forming a natural passage from the *Saurians* to the *Chelonians*, the last genera of which, in certain points of their conformation and habits, approximate nearly to the family under consideration.

Genera. Alligator.

(See the Article, vol. i. p. 349.)

Crocodylus.

Muzzle oblong and depressed; *teeth* unequal, the front teeth of the lower jaw at a certain age pierce the upper jaw, the fourth on each side, which are the longest, pass into lateral

notches of the upper jaw when the mouth is shut, and are not lodged in hollows. The *skull* behind the eyes has two large oval holes. The *hind feet* have a denticulated crest on their external border; the intervals of the toes, the external ones at least, are entirely palmated.

Nothing, observe MM. Duméril and Bibron, better distinguishes the *Crocodyles* from the *Alligators* than the narrowness of the muzzle behind the nostrils, a narrowness which is produced by the deep notch on each side of the upper mandible serving for the passage of the fourth lower tooth. The *Gavials*, it is true, have similar notches, which are destined for the same purpose. But at the extremity of the muzzle they have also two others for the reception of the front lower teeth; in lieu of this the front lower teeth in the *Crocodyles* pierce the upper mandible through and through. The horizontal contour of the head of the *Crocodyles* represents, in general, the figure of an isosceles triangle more or less elongated, depending upon the size of the jaws; but in no case is the muzzle wider than that of the *Caimans*, nor more slender than that of the *Gavials*. The *Crocodyles* have, like the former, their jaws festooned, as it were, on their sides, and their teeth unequal, but in less number, because they have never been observed with more than nineteen on each side above, and sixteen on each side below. The cranial holes are larger than they are in the *Caimans*, and less wide than they are in the *Gavials*. Their diameter is always found to be less than that of the orbits. The nasal aperture is oval or subcircular. There is a very small bony plate in the thickness of the upper eyelid.

a, skull of *Crocodylus vulgaris*, seen from above; b, skull of *Alligator Lucius*, same view; c, profile of skull of *Crocodylus vulgaris*; d, profile of skull of *Alligator Lucius*.

The same remark, as to the length of the head in proportion to its width at the three principal epochs of life, applies to the *Caimans* as well as to the *Crocodyles*. Thus, at the earliest age, it is only a little longer than it is wide; in middle age, its length is about double its width; afterwards, and when the animal may be considered adult, its longitudinal diameter is only three quarters, or even one half greater than its transversal diameter. The head of the *Crocodyles*, instead of possessing the smoothness or rugosity which marks the young and middle aged, generally becomes very

rugged in proportion as the animals grow old. If, for example, it offered simple and regularly disposed carinations, these become ramified or divided into insulated protuberances, which completely change the physiognomy that the species presented in its two first ages. This change is particularly remarkable in *Crocodylus biporcatus*.

The greater part of the Saurians of this group have the hind toes, the three external ones at least, united to their extremity by a wide natatory membrane. There are indeed some nevertheless in which it is shorter, and one species, *Crocodylus rhombifer*, wants the membrane almost entirely, in the interval of the two inner toes. With about two exceptions, all the *Crocodyles* have the posterior border of the leg furnished with a dentilated crest, formed of flattened scales. The two species which are said not to present this character are *Crocodylus Gravesii* and *Crocodylus rhombifer*.

a, hind foot of Caiman; b, hind foot of Crocodile.]

Only one species among the *Crocodyles* (*Crocodylus cataphractus*) has its cervical scales similar, in regard to the extent which they occupy on the neck, to those of the *Caimans*, that is to say, they form a long band commencing behind the nape and prolonging themselves to the first dorsal plates. In the others, the cervical armour occupies about the middle of the neck, so that there remains before and behind it a considerable space devoid of bony pieces. The scales which cover the sides of the body are flat in some, carinated in others, and there are some which are provided with both sorts. The *carinae* springing from the tail-plates to form the crest which surmounts that part, are in general lower, of less consistence, and less stiff than those in the *Caimans*. *Crocodylus rhombifer* must however be excepted; for the caudal crest of that species is very low, and, so to speak, osseous.

Merrem appears to be the only herpetologist who has not preserved the name of *Crocodyle* (*Crocodylus*) for this family: he has changed the name to *Champse*, the ancient Egyptian name (χάμψα), according to Herodotus, for the crocodile, and a word still in common use in that country. *Crocodylus* is the Latin form of Κροκόδειλος, a name given by the Greeks to a lizard common in Greece: this name, it appears, they afterwards applied to the crocodile of Egypt, when they travelled into that country. (Herodot., ii. 69.)

Zoologists seem to be agreed in allowing that there is scarcely any genus of *Reptiles* the species of which are so difficult to be distinguished from each other as those of *Crocodylus*. This task, observe MM. Duméril and Bibron, is become comparatively easy, thanks to the labours of Cuvier, Geoffroy St. Hilaire, and others, but still all difficulty is not removed. MM. Duméril and Bibron, after extensive examination, as they state, reduce the species to eight; and even of these, they appear to consider some, *Crocodylus Gravesii* and *Crocodylus galeatus*, for example, doubtful. We select as an example *Crocodylus vulgaris*.

Description. Jaws not elongated into a narrow beak. Hind feet largely palmated; and with a festooned crest along their posterior border. Six cervical plates. Dorsal

scutcheons or shields quadrangular, and surmounted by six longitudinal rows of *carinae* but little elevated.

Syn. *Crocodylus amphibius Niloticus*, Loch. *Le Crocodile du Nil*, Daud. *Crocodylus vulgaris*, Cuv. *Crocodylus vulgaris*, Tiedm. *Le Crocodile vulgaire*, Cuv. The common *Crocodyle*, Griff. Anim. Kingd.

[Nuchal and cervical plates, &c. of *Crocodylus vulgaris*.]

MM. Duméril and Bibron make four varieties of this species. Our limits will only allow us room for a lengthened description of the first. Variety A. Muzzle a little narrowed, rather flat than arched across, with small hollows and channellings, which are now and then worm-shaped, on its surface. Table of the skull entirely flat. Back green, speckled with black: two or three oblique bands of the last-mentioned colour on each flank.

Syn. *Crocodylus vulgaris*, Geoff. Ann. Mus., tom. x. p. 67. Descript. Eryp. (Hist. Nat.) tom. i. p. 8. Atlas, pl. 2, fig. 1, 2. *Crocodylus vulgaris*, Merr. Amph., p. 37, spec. 9. *Crocodylus Chamses*, Bory de Saint Vinc., Dict. Clas., tom. v. p. 105. *Crocodylus vulgaris*, Geoff., Crocod. d'Egypte, p. 159. *Crocodylus lacunosus*, Geoff., Crocod. d'Egypte, p. 167. *Crocodylus vulgaris*, Gray, Synops. Rept., part i. p. 57, spec. 1.

This, as well as the following variety, is that to which those individuals whose jaws are the least narrowed belong. The jaws have not, indeed, the same width in all, but it may be said generally, that their width, when measured at the ninth upper tooth, is only one-seventh of the length of the head measured from the end of the nose to the occiput. The table of the cranium is flat: its form is quadrilateral, but a little wider than it is long, and the anterior border is rather narrower than the posterior border, which is not exactly rectilinear; for it presents two curvatures of the same length, the concavity of which is inside. The post-orbito-cranial holes are large and oval: their internal border is somewhat raised into a ridge. The inter-ocular space is hollowed into a sort of gutter. There are some individuals of this variety whose upper mandible presents a nearly flat surface, that is to say, the extreme edge of its contour is the only part which declines towards the lower jaw. It sometimes happens, too, that the mesio-longitudinal region is, for a certain part of its length, slightly concave. The same individuals are, besides, distinguished by having the ridges which form their internal orbital borders continued in front of the eyes so as to form a lozenge-like figure open at its anterior and posterior angles. The mandibular surface is nearly unbroken, or, at most, presents small hollows, considerably like those which are to be seen on the carapace of the *Gymnopods* or *Trionyx*. The mummied individual on which M. Geoffroy founded his *Crocodylus complanatus*, but which MM. Duméril and Bibron regard as being clearly specimens of *Crocodylus vulgaris*, is remarkable for this condition.

There are other *Crocodyli vulgares* of the variety A, whose upper jaw is slightly arched across its posterior half, which presents on its mesial and longitudinal region a swelling more or less marked. In these the præorbital ridges are scarcely perceptible, and the inequalities on the surface of their muzzle are produced by numerous hollows, simply longitudinal or vermiculiform. As an example of this group MM. Duméril and Bibron refer to the individual brought from Egypt by M. Geoffroy, and which both Cuvier and himself have taken as the type of *Crocodylus vulgaris*.

[*Crocodylus vulgaris*.]

All the individuals belonging to the first variety seen by MM. Duméril and Bibron present a strong protuberance upon the upper mandible above the ninth tooth; and, on each side of the muzzle, behind the nasal hole, a longitudinal swelling directed obliquely inwards. The edges of the jaws are strongly festooned; the teeth with which they are armed amount to thirty-six in the upper mandible, eighteen on each side, and thirty in the lower jaw, fifteen on the right side and the same number on the left. The largest of the teeth are the third and the ninth above; the first, fourth, and eleventh below.

The length of the posterior limbs is equal to the extent of the body between the shoulder and the thigh. The anterior limbs are one-third less, and have the toes entirely free. The hind toes are united by a natatory membrane.

Behind the occiput there are two pairs of scutcheons or shields placed across the nape, one on the right, the other on the left, of the mesio-longitudinal line. They are oval and strongly carinated. There are individuals which have only two of these scutcheons, and others which have three; but the proper number, and that presented by the greatest number of examples seen by MM. Duméril and Bibron, is four. After the nuchal scutcheons come two others, much smaller, which are placed one on each side of the neck, rather near the cervical shield. The plates which compose this are six in number, forming two transverse rows, one of four a little arched, the other of two. Of these six plates, which are squared or trapezoid, the two middle ones of the first rank are the largest, and the two lateral ones the smallest: their *carina* is strong and moderately elevated.

From sixteen to eighteen rows of bony scutcheons may be counted on the upper part of the body, from the shoulders to the origin of the tail. When there are seventeen or eighteen, the first is almost always composed of two scutcheons only; but in general four may be counted in the first row, from six to ten or eleven in the following rows, and four only in the last rows. The back presents six longitudinal rows of *carinae*, but of these the two external ones are much shorter than the others. The plates which support the *carinae* of these two external rows are of a sub-oval form. Those of the middle are four-sided, wider than they are long: those of the other two are squared. The *carinae* of the two middle series are lower than the others. To the right and left of these six rows of carinated dorsal plates, there are four or five others smaller and oval, which are not always disposed sufficiently regularly to form a band parallel to that on the outside of which it is placed.

The tail is surrounded by from twenty-six to thirty-eight scaly rings. The crest which surmounts it is double, sometimes as far as the fifteenth, sometimes as far as the seventeenth: it is delicate, flexible, and deeply dentilated. The caudal *carinae* of the middle region disappear after the ninth scaly ring.

The scales of the sides of the body and of the upper and lateral parts of the neck are flat: some are oval, others circular. Tuberculated and carinated scales may be sometimes seen among them. The limbs are covered by rhomboidal and simple *scutella*. The posterior border of the hind limbs is furnished with a dozen, forming a festooned crest.

The lower part of the body is protected by quadrangular *scutella*, having often each a pore towards the middle of its posterior border.

Colour.—All the upper part of the body is of an olive-green, sprinkled with black on the head and neck, and marked with the same colour on the back and tail. Two or three large oblique black bands show themselves on each flank. The lower parts of the animal are of a greenish-yellow. The nails are of a brown tint.

Dimensions.—MM. Duméril and Bibron state that they

have seen eighteen individuals of this variety, from fifty centimetres to three metres in length. Those of the individuals whose locality is well proved came from Egypt or Senegal. There were eight from the latter country and among them were the smallest and the largest of the series. Among the Egyptian specimens was that dissected at Cairo by M. Geoffroy, who brought it to the French Museum, and two mummies, one a metre long, which MM. Duméril and Bibron are of opinion was erroneously considered by M. Geoffroy as belonging to his *Crocodylus marginatus* (variety C. of MM. Duméril and Bibron); the other, two metres and fifty centimetres in length, on which M. Geoffroy founded his species *Croc. complanatus*.

Variety B. *Crocodylus palustris*. Less. Voy. Ind. orient. Bell, Zool. Rept. p. 305. *Crocodylus vulgaris*, Var. E. Gray, Synops. Rept., p. 58.

Variety C. *Crocodylus marginatus*. Geoff. Croc. d'Egypte. p. 165. *Crocodylus vulgaris*, Var. B. Gray, Synops. Rept., part i., p. 58.

Variety D. Body elongated, slender. Jaws very much narrowed; the upper jaw slightly arched transversely. Chanfrein elevated; surface of the upper mandible somewhat embossed as it were. Cranial region perfectly flat. Carinae of the two mesio-longitudinal series a little lower than the others, and also more approximated. Upper parts sprinkled with black angular stains. Syn. *Crocodylus complanatus*, *Crocodylus Suchus*, Geoff.

It may be expected that we should notice the ancient history of an animal held sacred by the Egyptians and even elevated by them to the rank of a deity, for it was certainly one of the symbols of Typhon. Herodotus, Aristotle, Diodorus, Strabo, and Plutarch, will be read with interest on this subject. While it was worshipped in one part of Egypt under the name of *Suchus* or *Souchis*, it was eaten at Elephantine. Cuvier observes that the term Σοῦχος or Σοῦχης was only applied to the sacred individual, as Apis, Mnevis, and Pacis were appellations of the deified bulls of Memphis, Heliopolis, and Hermonthis respectively, and not intended to designate particular races of oxen. Geoffroy St. Hilaire is of a different opinion from Cuvier, who considered that *Champsæ**, as used by Herodotus, was not applied by that historian to the locality of Elephantine alone, nor to any particular species. Geoffroy observes that the crocodile still bears in Egypt the name of *Temsa*, which M. Champollion thought he recognized upon many papyri as *mshah*, a word which he regards as formed of the preposition 'm,' 'in,' and the substantive 'sah' 'egg.' With regard to the *Suchus*, M. Champollion, the younger, states that the Egyptians gave the name of *Souk* to a deity which they represented as a man with a crocodile's head. We refer those who wish to follow out this part of the subject more especially to the ancient authors above mentioned, to M. Geoffroy St. Hilaire, to Cuvier, and to the interesting work lately published on Egyptian antiquities† as part of the 'Library of Entertaining Knowledge,' observing only that the Egyptians ornamented their tame crocodiles by hanging rings of gold and precious stones in the opercula of their ears, which they pierced for the purpose, adorned their forefeet with bracelets, and presented them in this finery to the veneration of the people. They also fed them well. Cake, roast-meat, and mulled wine were occasionally crammed and poured down their throats. Pliny, Ælian, and others did little but copy what preceding writers had written upon this subject, but we learn from the former that the Romans first saw them in the Ædileship of Scaurus, who showed five. Augustus introduced thirty-six of

* Καλῶνται δὲ οὐ κροκόδειλοι ἀλλὰ χάμψαι—But they are not called Crocodiles, but Champsæ.

† The British Museum, 'Egyptian Antiquities, vol. ii., London, C. Knight, 1836, 12mo.

them into an amphitheatre at one time, where they were all killed by Gladiators.

It is said that *Crocodilus vulgaris* is no longer seen in the Delta, but that it is found, sometimes in great numbers, in the Thebaïd and the Upper Nile.

Gavialis.

Jaws very narrow, very much elongated, forming a sort of subcylindrical beak. Four notches in the upper mandible, in which are received the first and the fourth of the lower teeth.

The upper mandible of the *Gavials* is never pierced for the intromission of the teeth of the lower jaw, as it is in *Crocodilus*; but there are four large notches which serve as lodgments for the first and fourth pair of lower teeth. The *Gavials* are besides distinguished by the narrowness and length presented by the anterior part of their head and jaws, which resemble a sort of straight beak spread out at its origin, subcylindrical for the greatest part of its length, and terminating in a slight circular enlargement at its extremity. These jaws are rectilinear, and not undulated as in *Alligator* and *Crocodilus*. The number of teeth with which these narrow mandibles are armed is also greater than in either of the last-mentioned genera, amounting ordinarily in *Gavialis* to 118 or 120, all of which are equal, with the exception of those which compose the five or six first pairs above as well as below. The post-orbito-cranial holes are oval, and larger than they are in *Crocodilus*, for their diameter approaches that of the orbits themselves. The external orifice of the *nasal fossæ* or rather of the long canal, which M. Geoffroy St. Hilaire has termed *Cranio-respiratory*, is triangular. The membrane which closes this orifice has a considerable development in the males, and forms a large, oval, cartilaginous mass. This prominence is a kind of sac divided into two portions internally, the aperture of which is backwards and a little below. As in the crocodiles, the eyelid contains in its substance a rudiment of a bony plate.

The hind feet of the *Gavials* are formed for the most part in the same manner as those of the majority of species of *Crocodilus*; that is to say, there are long and wide webs between the toes, and the posterior part of the leg is furnished with a dentilated crest. The cervical plates of the *Gavials* form a long band on the neck, as in the *Caimans*, and in one species only of *Crocodile*. The scales of the flanks are flat and oval. The *carinæ* which surmount the bony pieces forming the dorsal cuirass are low, but the crest of the tail is very much elevated throughout the whole of its length.

The *Caimans* and *Crocodiles*, in their youth, have the

a, skull of the Great Gavial, *Gavialis Gangeticus*, seen from above; b, lower jaw of Gavial, another individual; c, profile of the skull of Gavial; d, outline of the head covered with the integuments.

head short in proportion to the size which it exhibits at their full growth. The contrary obtains among the *Gavials*, for in them the head is proportionally longer in youth than it is in age, so that it has the appearance of becoming shorter as the animal increases in size. (Duméril and Bibron.)

The *Gavials* were distinguished generically by Cuvier under the name of *Longirostris*, and by Wagler under that of *Rhamphostoma*. The term generally adopted by zoologists is *Gavialis*. Example. *Gavialis Gangeticus*.

Description.—The head of the *Gavial* may be considered as framed of two parts; one anterior and long, almost cylindrical in form, more or less flattened; the other posterior and short, presenting the figure of a depressed hexahedron, wider behind than before. The jaws constitute the anterior part or beak, which is long, straight, and of extreme narrowness, but not, properly speaking, cylindrical. It is four-sided, but the angles are rounded. It spreads out at its base and terminates in front, so as to recall to the observer the beak of the *Spoonbill*. Its vertical diameter is throughout less than its transversal diameter.

The head, properly so called, that is, the part situated behind the beak, has its sides straight and perpendicular. The upper surface is quadrilateral. The post-orbital portion is flat and smooth, except that one can perceive through the skin the subtriangular or ovöid holes with which the skull is dotted. The other portion is considerably inclined forwards, and mostly occupied by the eyes, the interval between which forms a slight gutter-like depression. The mandible is not continued from the forehead by a gradual slope as it is in the *Crocodiles*, but sinks suddenly to follow a straight and nearly horizontal direction, on a line with the inferior edge of the orbit. At the extremity of this upper mandible are the four notches for the passage of the first and fourth lower teeth when the mouth is shut. Two of these notches are very deep, and situated quite in front; the other two are moderate, and placed one on the right, the other on the left, behind the spatuliform termination of the beak, where it is slightly constricted.

The division of the lower jaw into two branches does not commence till towards the twenty-second or twenty-third tooth. The ten first upper teeth, among which the two anterior teeth are the least separated, are implanted in the intermaxillary bone, and the greater portion of the teeth of the upper mandible are longer than the corresponding teeth of the lower jaw. Up to the nineteenth or twentieth pair they are turned a little outwards, so that when the mouth is shut the upper teeth pass over the sides of the lower jaw, and the lower teeth over the sides of the upper. The six last pairs are straight or nearly so, so that the points of the one set correspond exactly with the intervals of the other. The first, the third, and the fourth above, and the first, second, and fourth below, are the longest. They are, in general, a little curved and slightly compressed from before backwards, and are very slightly trenchant right and left. Hardly more than the eight or nine last on each side are nearly conical. Slight vertical ridges show themselves on the surface of the teeth of old individuals.

Under the throat, about the middle of the branches of the maxillary bone, are situated, one on the right and the other on the left side, the musky glands.

The external orifice of the nostrils opens on the upper side of the beak, at a small distance from its terminal border. The aperture is semilunar, at the bottom of which may be perceived a cartilaginous plate, which divides it longitudinally in two. The edges of this opening form two lips, which appear to have the power of approaching each other, so as to close the aperture hermetically. The anterior of these is curvilinear, and the posterior rectilinear: in the females and in young subjects they are very delicate and quite soft; but in the old males the anterior lip not only arrives at a cartilaginous consistence, but a development that carries it backwards as far as the seventh pair of teeth, and triples the thickness of the muzzle. This pouch or cartilaginous sac, with two compartments, is of a sub-oval form, and is notched behind so as to form two very thick rounded lobes. Above these is, on the mesial line and in front, a cordiform prominence, on each side of which is a deep fold in the form of the letter S. This sac has its opening, which is common to it and the nostrils, below. This apparatus is the nasal purse or pouch (*Bourse nasale*) of M. Geoffroy, and in his opinion performs the office of a reservoir of air for the animal when plunged beneath the surface of the water.

The anterior limb is nearly one-half longer than that part of the body which lies between the anterior and posterior limbs of the same side. The hinder limb is about two-thirds of the same interval. The third toe is longest in all the feet. The three middle toes of the fore foot are united at their base by a very short membrane: the other two toes are free, as well as the first toe of the posterior feet; but the second, third, and fourth of these last, are united by a thick membrane with a free border, which is notched as it were semicircularly between the toes. The nails are slightly arched.

The nape supports two strong scutcheons, surmounted by a *carina*, more compressed behind than it is before. Their form is oval, and their height nearly equal to their width. There is sometimes a small scutcheon on each side of these. This is the case in one of the largest individuals; viz., that described by Lacépède, and figured by Faujas de Saint-Fond in his 'History of St. Peter's Mountain,' at Maestricht. The cervical scutcheons, to the number of four pairs, form a longitudinal band, which extends from two-thirds of the length of the neck to the dorsal shield. The two first are triangular, the six others quadrilateral. Each of them have a longitudinal *carina* on their mesial line, and there is a large scale on the left and on the right of the last pair.

[Nuchal and cervical plates, &c., of two individuals of *Gavialis Gangeticus* from Cuvier.]

The upper part of the body is transversely cut by eighteen bands of osseous plates, with equal *carinae*, which consequently form four longitudinal rows all down the back. The plates of the two lateral rows are squared and rather smaller than those of the mesial rows, which are also four-sided, but their longitudinal diameter is less than their transversal. A longitudinal row of other carinated scutcheons borders this dorsal cuirass on the right and on the left, for a part of its length. The flanks, the sides of the neck, and a portion of its upper part, are covered with oval, flat scales of moderate size. The tail is surrounded by from thirty-four to forty scaly circles, the number varying

in different individuals. The denticulated crest does not become very perceptible till towards the sixth or seventh circle: its double portion terminates at the eighteenth or nineteenth. This crest is highest towards the middle of the tail, elsewhere it is delicate and flexible. The scales which clothe the lower parts of the body are quadrilateral, oblong, and perfectly smooth: there are nearly sixty transverse rows from the chin to the vent, and, like those of the flanks, they are all pierced with a small pore on the middle of their posterior border.

The limbs are protected above with rhomboidal scales: the anterior limbs on their external edge; the posterior limbs, from the hock (*jarret*) to the little toe, have a row forming a serrated edge. The surface of the natatory membranes is covered with granulous scales.

Colour. The ground colour of the upper parts is a deep water green, on which are often scattered numerous oblong, irregular, brown spots. In young subjects, the back and limbs are transversely banded with black. The lower region of the body is very pale yellow, or whitish. The jaws are sprinkled with brown. The nails are of a clear horn-colour. (Duméril and Bibron.)

The Gavial of the Ganges is supposed to be the largest of the living Saurians. The measurement of the largest mentioned by MM. Duméril and Bibron is given at five metres, forty centimetres.

Cuvier was led to think, principally from the figures published by Faujas de Saint Fond, that there was more than one species of Gavial, and on subsequent inquiry, distinguished two, the *Great Gavial* and the *Little Gavial*; but he was afterwards satisfied from the examination of numerous specimens that age alone made the difference between them.

FOSSIL CROCODYLIDÆ.

'In the living subgenera of the Crocodilean family,' observes Dr. Buckland (*Bridgewater Treatise*, p. 250), 'we see the elongated and slender beak of the Gavial of the Ganges, constructed to feed on fishes; whilst the shorter and stronger snout of the broad-nosed Crocodiles and Alligators, gives them the power of seizing and devouring quadrupeds that come to the banks of rivers in hot countries to drink. As there were scarcely any mammalia during the secondary periods, whilst the waters were abundantly stored with fishes, we might, *a priori*, expect that if any Crocodilean forms had then existed, they would most nearly have resembled the modern Gavial. And we have hitherto found only those genera which have elongated beaks, in formations anterior to and including the chalk; whilst true Crocodiles, with a short and broad snout like that of the Cayman and the Alligator, appear for the first time in strata of the tertiary periods, in which the remains of mammalia abound.'

In accordance with this view, we proceed to give examples of the long-beaked division, which, while it bears a strong resemblance to the living *Gavial* in the form of the head and jaws, will be found to differ materially from it in some particulars.

The genus *Steneosaurus* of Geoffroy St. Hilaire appears to come the nearest in its conformation to the living *Gavial*, and a general idea of the structure of the muzzle and anterior nasal aperture will be derived from the following cut of a specimen from Havre*;

[Muzzle of *Steneosaurus* from Dr. Buckland, who quotes De la Beche.]

whilst, in *Teleosaurus*, Geoff., though there is considerable similarity in the general contour of the head and jaws, the conformation of the muzzle and nasal aperture is very different from that of the living saurian, the anterior termination of that aperture forming almost a vertical section of the extremity of the upper mandible.

As an example of the more Crocodilean form, we select the cranium and the upper mandible of a specimen from the London clay of the Isle of Sheppey, figured also by Dr. Buckland in his *Bridgewater treatise*.

* Dr. Buckland states that the same species occurs in the Kimmeridge clay of Shotover Hill near Oxford.

[*Teleosaurus Chapmani*. *a*, head seen from above; *b*, head of another individual of the same species seen from below, showing the lower jaw; locality of both, Lias in the neighbourhood of Whitby; *c*, inside view of anterior extremity of lower jaw. Locality, Great Oolite at Enslow near Woodstock, Oxon. From Dr. Buckland.]

Anterior extremities of the beak or jaws of *Teleosaurus*. Locality, Great Oolite, Stonesfield, Oxon. From Dr. Buckland.]

[Skull of *Crocodilus Spenceri*.]

Though differing from both, it will be seen by a reference to our cuts, that this last form of head comes nearer to that of *Alligator* than to that of *Crocodilus*.

MM. Duméril and Bibron, in their elaborate work on Reptiles, from which we have drawn largely, arrange the genera *Ichthyosaurus* and *Plesiosaurus* among others, under their *Sauriens Aspidiotes Fossiles*, an arrangement to which we cannot subscribe on account of the great difference between the organization of these extinct Saurian forms and the *Crocodylidae*. Indeed the very heading *Sauriens Aspidiotes fossiles*, would seem to be a warning to exclude *Ichthyosauri* and *Plesiosauri* from such an association.

We cannot close this part of the subject better than in the following words of Dr. Buckland.

'The discovery of Crocodilian forms so nearly allied to the living Gavial in the same early strata that contain the first traces of the *Ichthyosaurus* and the *Plesiosaurus*, is a fact which seems wholly at variance with every theory that would derive the race of Crocodiles from *Ichthyosauri* and *Plesiosauri* by any process of gradual transmutation or development. The first appearance of all these three families of reptiles seems to have been nearly simultaneous; and they all continued to exist together until the termination of the secondary formations, when the *Ichthyosauri* and *Plesiosauri* became extinct, and forms of Crocodiles approaching to the Cayman and the Alligator were for the first time introduced.' (*Bridgewater Treatise*, vol. i. p. 254.)

CROCODYLURUS. [LACERTIADÆ.]

CROCUS, a beautiful genus of Iridaceous plants, consisting of many hardy species, some of which are among the commonest ornaments of gardens. Crocuses are chiefly found in the middle and southern parts of Europe and the Levant, three only being wild with us, namely *Crocus nudiflorus*, which is abundant in the meadows near Nottingham, *C. vernus*, and *C. sativus*. Botanists have found it extremely difficult to ascertain by what precise technical marks the species are to be distinguished. We do not propose to occupy ourselves with that subject, but shall rather

enumerate briefly the names and localities of such as are apparently distinct; so that those who wish to form a complete collection of these pretty flowers may know where to look for them, and when their task is accomplished.

* VERNAL SPECIES.

1. *C. vernus*. This is the common purple or white crocus of our gardens in the spring. It has produced a multitude of florists' varieties, some of which are extremely beautiful and well marked. Its root-coats are finely netted, its flowers scentless, and the throat of the tube of the flower hairless. *C. albiflorus* and *C. obovatus* are varieties of it. It is said to be wild in some parts of England, but it may have been introduced. It is certainly wild on the Alps, particularly of the Tyrol, Piedmont, Switzerland, Salzburg, and Carinthia, descending to the sea-coast at Friuli. It is also found on the mountains of the Abruzzi and elsewhere in similar situations in the kingdom of Naples, associating itself with oaks, chestnuts, and similar trees, and not existing at elevations exceeding 6000 feet.

2. *C. versicolor*, the common sweet-scented, variegated, spring crocus. There are not many varieties of it, all of which are recognized by the root-coats not being cut circularly, the yellow tube of the flower bearded with hairs, and the sweet scent. It grows wild about Nizza (Nice), and in all the eastern parts of Provence.

3. *C. biflorus*, the Scotch crocus. The beautiful pencilled sepals and clear or bluish white petals of this species distinguish it at once; added to which the root-coats are cut round into circular segments, a circumstance that occurs in no other species. It is a native of the most southern parts of Italy; growing wild in sterile subalpine pastures in the kingdom of Naples, and in similar situations in Sicily. Our garden plants are merely a cultivated state of the *C. pusillus* of the Italians.

4. *C. Imperati*. This is little known in England. Its leaves appear long before the flowers, and are glaucous and spreading. The petals and sepals are a delicate violet inside, but externally white; the petals are almost whole-coloured and pale purple, except at the base; the sepals are strongly feathered with rich purple. A white and a whole-coloured variety of it are said to exist. It differs from *C. biflorus* in its root-coats being membranous, and not cut circularly, and from *C. versicolor* in the tube of the flower not being hairy. It inhabits low hills and woods in the kingdom of Naples, on Capri, on Mount S. Angelo di Castellamare, and elsewhere. It is supposed that *C. suaveolens* is at most only a variety of this.

5. *C. luteus* or *mæsiacus*, the large yellow crocus. It is characterized by very large whole-coloured flowers, and large roots, with coarsely netted coats. It is an oriental plant, but its exact locality is unknown.

6. *C. aureus*, the small yellow crocus, by no means so common as the last, of which it is probably a variety. Its flowers are smaller and deeper coloured, and it has a pale cream-coloured variety. Dr. Sibthorp found it wild on the hills of the Morea.

7. *C. susianus*, the cloth of gold crocus. This species is well known for its coarsely-netted root skin and small deep yellow flowers, the sepals of which are feathered with dark chocolate brown, and are rolled back when expanded under sunshine. It is a native of the Crimea, the Ukraine, and the other parts of south-western Russia: it is also believed to be a Turkish plant; and localities are given for it under the name of *C. reticulatus*, on mountains near Trieste, in woods near Lippizza, in Friuli, and in Hungary, in the lordship of Tolna. A remarkable variety with deep purple flowers exists, but it is extremely rare.

8. *C. stellatus* and *sulphureus* are pale and probably hybrid varieties of *C. luteus*. They have never been seen except in gardens, and are the least pretty of the genus.

* * AUTUMNAL SPECIES.

9. *C. sativus*, the common saffron crocus, an eastern plant, cultivated from time immemorial for the sake of its long reddish orange drooping stigmas, which, when dried, form the saffron of the shops. Its Asiatic localities are not known; in Europe it grows apparently wild in the south of Tyrol, and is said to have been found near Ascoli, and on the Alps of Savoy. Its British station is in all probability to be ascribed to accident.

10. *C. odoratus*, the Sicilian saffron. This species, which has also been named *C. longiflorus*, is found in mountain

pastures in Calabria, and in both mountainous and maritime situations through all Sicily, where its stigmas are collected instead of those of the true saffron. Its blossoms are sweet-scented, and are known at first sight from the stigmas not hanging out of the flower, but standing upright and inclosed within it. The tube of its flower is very long.

11. *C. Thomasii*, a Calabrian plant, found in mountain woods. It is said to have coarsely-netted root-coats, fragrant saffron-like truncated stigmas inclosed within the flower, which appears long after the leaves, and has a bearded throat. Exists in English gardens, but is very rare.

12. *C. nudiflorus*. The flowers appear without the leaves, and the root-coats are slightly netted. The stigmas are divided into many deep narrow segments. The plant is not rare in many parts of Europe, flowering about the time of the Colchicum, to a small species of which it at first sight bears much resemblance. *C. speciosus*, *multifidus*, *medius*, are mere varieties or synonymous names of this plant.

13. *C. ecrotinus*. This requires to be compared with *C. odoratus*, to which it approaches very nearly, if it be not the same thing.

For a florist's account of the varieties of spring crocuses cultivated in the gardens of this country, see the *Transactions of the Horticultural Society of London*, vol. vii.

CRÆSUS (Κροῖσος), the last of the Mermnadæ, son of Alyattes, succeeded his father Alyattes as king of Lydia at the age of thirty-five, B. C. 560. (Herod. i. 7 and 26.) But before this time he seems to have been associated with his father in the government. (Clinton, *Fast. Hel.*, p. 297; and Larcher on *Herod.*, i. 27.) He was contemporary with Pisistratus, tyrant of Athens (Herod. i. 59), and with Anaxandrides, king of Sparta (i. 67). He attacked and reduced to subjection all the Ionians and Æolians in Asia (i. 26), and all the nations west of the Halys (i. 28). The increase of the Persian power led him, after consulting various oracles in Europe, Asia, and Africa, to form an alliance with Amasis, king of Egypt (i. 77), and with the Lacedæmonians (i. 69), as the most powerful people of Hellas, about 554 B. C. (Clinton, *F. H.*, p. 207). He subsequently attacked and conquered the Cappadocian Syrians beyond the Halys, and engaged in battle with Cyrus, in which however neither was victorious. He returned to Sardis, intending to wait till the following year to renew the war; but Cyrus, anticipating his designs, attacked him in his own capital, defeated him, and took Sardis B. C. 546. Cræsus was made prisoner and was placed on a pile to be burnt, but Cyrus relented, and the fire was extinguished. He reigned fourteen years. After his captivity he became Cyrus's favourite companion and adviser in his future wars. When Cyrus died he recommended Cræsus to his son and successor Cambyses, as one in whom he might confide as a friend. Cræsus however did not long continue in the favour of Cambyses: he took upon himself on one occasion to admonish the king, believing him to be insane, and he had great difficulty in escaping with his life. Little is known of him after this period. While king he was visited by Solon, and Herodotus (i. 30—33) records a long conversation between them on wealth and happiness. The riches of Cræsus were so great that his name has almost passed into a proverb. It is said that he had a son who was born deaf and dumb, but who gained the faculty of speech by the effort which he made to cry out when he saw a Persian going to kill his father at the capture of Sardis. (Herodotus; Plutarch, *Life of Solon*.)

CROFT, WILLIAM (Mus. Doc.), who as a composer of cathedral music has no superior, was born in Warwickshire in 1677, and educated in the Chapel-Royal under Dr. Blow. His earliest preferment was to the place of organist of St. Anne's, Soho, when an organ was for the first time erected in that church. In 1700 he was admitted a gentleman-extraordinary of the Chapel-Royal; and in 1704 was appointed joint-organist of the same with Jeremiah Clark, on whose decease, in 1707, he obtained the whole place. In 1708 he succeeded Dr. Blow as Master of the Children and Composer to the Chapel-Royal, and also as organist of Westminster Abbey. In 1711 he published, but without his name, a volume containing the words of the anthems used by the three London choirs, with a preface, giving a brief history of English church-music; in which, on the authority of Dean Aldrich, he ascribes the anthem, 'O Lord, the Maker of all things!' to Henry VIII., and mentions Tallis as famed throughout Europe for his compositions. In 1715 Croft was created Doctor in Music by the University of Ox-

ford; his Exercise consisted of a Latin and an English Ode, both of which were afterwards curiously engraved in score, and published under the title of *Musici Apparatus Academicus*. In 1724 he published his noble work, *Musica Sacra*, in two volumes, folio. In the preface to this he states that his work is the first essay in music-printing of the kind, it being in score, engraved, and stamped on plates, and that for want of some such contrivance, the music formerly printed in England was very incorrectly published; as an instance of which he mentions Purcell's *Te Deum* and *Jubilate*. Dr. Croft died in 1727, of an illness produced by his attendance at the coronation of George II., and was interred in Westminster Abbey, where a monument, erected to his memory by his friend Humphrey Wyrley Birch, Esq., records his high merits as a composer, and his amiable and excellent moral qualities as a member of society. Besides his ecclesiastical music, Dr. Croft was the author of six sonatas for two flutes, six for a flute and a base, and numerous songs, which appeared in the various musical publications of his day. (Hawkins' and Burney's *Histories*.)

CROMARTY. [ROSS AND CROMARTY.]

CROMER. [NORFOLK.]

CROMLECH, a large stone placed in the manner of a table, but in an inclined position, upon other stones set up on end. Monuments of this description are numerous in Anglesea, where two of the largest Cromlechs in Britain remain at Plas Newydd. Many others are seen in Wales. They are likewise found in Scotland, Ireland, Jersey, Brittany, and, in fact, wherever the religion of the Druids prevailed. Cromlechs are also described to have been found both in North and South America. Borlase, in his 'Natural History of Cornwall,' suggests that they were sepulchral. But Rowlands, in his 'Mona Antiqua,' King, Toland, and numerous other of our best antiquaries, consider them the remains of altars used for idolatrous sacrifices. They were usually placed in the centre of a circle of stones, the Druid temple; and had a single stone, of large size, occasionally near them, supposed to have served as a pedestal for some deity.

CROMWELL, THOMAS, was born at Putney, near London, where his father was a blacksmith, and afterwards a brewer. He was taught reading, writing, and a little Latin; and as soon as he grew up went to the continent, where he learned several foreign languages. He became clerk in an extensive factory at Antwerp; from whence he was taken to Rome (1510) by some citizens of Boston in Lincolnshire, who thought that he would be of assistance to them in some business that they had with the pope. During this journey he learned by heart Erasmus's translation of the New Testament, and he continued to improve himself during his residence in Italy. On his return he was received into Cardinal Wolsey's house, became his solicitor, and the chief agent in the foundation of his colleges at Oxford and Ipswich. He was also returned as a member to the House of Commons, where he increased his fame by his defence of Wolsey, who had there been indicted for treason. After the cardinal's disgrace, Cromwell was taken into the service of the king: in 1531 he was knighted, and made privy councillor and master of the jewel-house. He now rapidly rose to the most important offices in the state. In 1532 he became Clerk of the Hanaper in the Court of Chancery, and afterwards Chancellor of the Exchequer: in 1534 he was Principal Secretary of State, Master of the Rolls, and Chancellor of the University of Cambridge; in 1535, Visitor-General of English monasteries, and in 1536 Keeper of the Privy Seal. He now resigned the Mastership of the Rolls, and was created Baron Cromwell of Okeham in Rutlandshire, and appointed Vicar-General and Vicegerent, in all religious matters the next in authority to the king, who was now the supreme head of the English church. His friendship with Cranmer was intimate, and their views respecting the reformation very similar. It being Cromwell's object to destroy the pope's authority, he circulated new articles of faith, and enjoined the clergy to preach the king's supremacy, to remove images from their altars, and to promote the religious education of all young persons, teaching them the Creed, the Lord's Prayer, and the Ten Commandments. He commanded English Bibles to be placed in the churches, and took active means for the dissolution of the monasteries. These alterations, together with the great increase of his wealth, some of which it was suspected that he obtained by dishonest means, rendered him extremely unpopular, so that there were not wanting

many enemies who endeavoured to prejudice the king against him. The king's esteem for him could not however be shaken in 1537 he was appointed Chief Justice of all Forests beyond Trent, and in August in the same year was elected Knight of the Garter, and nominated Dean of Wells. The long list of Cromwell's titles and official appointments is still far from completed. In 1538 he was made Constable of Carisbrook Castle, and obtained a grant of the castle and lordship of Okeham. About this time he issued various injunctions [CRANMER] to the clergy, by one of which parish-registers were established; and in 1539, after having received from the king several monastic manors and valuable estates, was created Earl of Essex, and named Lord Chamberlain of England: at the same time Gregory, his son, obtained the barony of Okeham.

Hitherto there had been little check to the career of Cromwell's prosperity: his favour at court had always been sufficient to stifle any popular complaints, but he now became aware that both Cranmer and himself were declining in the royal estimation. Gardiner (bishop of Winchester) and his party had gained some ascendancy over the king, and in proportion as the power of these advocates of the Roman Catholic faith increased, the influence of the reformers declined, and both they and their doctrines became unacceptable at court. In order to regain his former ground, or at least to intrench himself firmly in the powerful position which he still retained, Cromwell lost no opportunity of promoting Henry's marriage with Anne of Cleves, taking care to set before the king, as often as circumstances permitted, the many advantages which would arise from such a union. The cause of Cromwell's great zeal was this: Anne and all her friends were Lutherans, and Cromwell counted upon great support from a queen of his own choice, whose religious opinions were in direct opposition to the Roman Catholics. The complete failure of this scheme became the ruin of its contriver. An aversion to the promoter of the marriage quickly followed the king's disgust and disappointment at his ugly bride, and Henry now willingly opened his ears to the flood of complaints which were poured into them from every quarter. To the laity Cromwell was hateful, on account of the oppressive subsidies that he had raised notwithstanding the large sums which had accrued from the dissolution of the monasteries; to the nobility he was still more odious, on account of the titles and power that he had obtained notwithstanding the meanness of his birth; and to the Roman Catholics he was an object of aversion and jealousy, on account of the Protestant doctrines that he held and promulgated. As soon then as it was apparent that the capricious king, who had elevated him from an humble individual to be the most powerful subject in the realm, was no longer willing to support him, his downfall was certain. The numerous important acts of his administration supplied his enemies with abundant proofs of malversation and treason. He was arrested on the 10th of June, 1540, and committed to prison. The letters that he wrote to the king praying for pardon were disregarded, though the king was touched by them, and read them thrice over: he was accused on the 17th of June in the House of Lords, which sent the bill of attainder down to the House of Commons on the 19th. Here some objections were raised against the bill; but after a delay of ten days a new bill was framed by the Commons, which the Lords afterwards passed. This bill contained twelve articles of impeachment (Burnet, *Hist. Ref.* vol. i.), accusing him, among other crimes, of being 'the most false and corrupt traitor and deceiver that had been known in that reign,' 'of being a detestable heretic,' and 'of having acquired innumerable sums of money and treasure by oppression, bribery, and extortion.' To these accusations he was not allowed to answer in court, for fear, as it may be supposed, that he would prove the king's orders, directions, or consent for doing many things of which he was accused. He was kept in close custody for six weeks, when any hope that he might have entertained of a reprieve was put an end to; the charms of Catherine Howard and the endeavours of the duke of Norfolk and the bishop of Winchester prevailed, and the king signed a warrant for his execution, which took place on Tower Hill on the 28th of July, 1540. Thus fell this great minister, of whom, as indeed of most of his contemporaries, very opposite characters have been handed down to us by historians. His virtues are greatly magnified by the advocates of the Reformation, his vices by its opponents. It appears doubtful, from a speech that he made at his death, in which religion he

died; but it is very probable that he was a Lutheran, and that he used the term *Catholic* Faith (which some have held was intentionally ambiguous in his speech and afterwards in Cranmer's) in the Lutheran meaning of the term. Cromwell was no patriot: his own interest, elevation, and aggrandizement seem always to have been uppermost in his thoughts. He was ambitious, unscrupulous, rapacious, hypocritical, and suspicious. To counterbalance these evil qualities he had few virtues. He is said to have shown cruelty in the condemnation and execution of some heretics, but he could scarce have been without benevolence, for about 200 persons (Stowe's *Survey*) were fed twice a day at his gate. He had a good understanding, and a very retentive memory, and his attention to business was frequent and assiduous. He was the promoter of many useful alterations in the laws, and especially in those respecting the church. These were his chief merits. In passing judgment upon him, the remembrance of the reckless tyrannical caprice of his master, of the rapidity of his own advancement, together with the licentiousness of the times, should enhance the value of his merits, and temper our condemnation of his crimes.

(Fox's *Acts and Monuments*; Stow's *Annals*; Strype's *Memorials*; Lord Herbert's and other *Histories of England*; Burnet's *Reform.*; Collier's *Ecclesiast. Hist.*; the *Biog. Brit.*, &c. &c.)

CROMWELL, OLIVER, the son of Robert Cromwell, and his wife Elizabeth, daughter of Sir Richard Stuart, was born in St. John's parish in the town of Huntingdon, on the 25th of April, 1599, and named after his uncle and godfather, Sir Oliver Cromwell, a worthy member of his antient and respectable family. He grew up a stubborn mischievous boy, so little inclined to sedentary occupation, that when in 1616 he exchanged a school at Huntingdon for Sidney College, in the neighbouring university of Cambridge, he had made no great progress in his studies. At the death of his father, which occurred soon after he went to college, he was removed from the university by his mother, who in the changed state of her circumstances, thought it more prudent to enter her son at Lincoln's Inn, that he might follow the profession of the law. To such a grave study however Oliver did not feel inclined. With little intention to use them for their proper purpose, he took possession of his chambers: the vices of the town were new to him, and being no longer restrained by the vigilance of his father, he fell into profligate habits, and became addicted to gambling. Two or three years afterwards, when he returned to Huntingdon, he still continued to live so dissolute a life that he forfeited the friendship of his uncle Sir Oliver Cromwell. His mind however soon became uneasy; the diminution of his fortune and compunction for his conduct weighed upon his spirits, and on a sudden there appeared a great alteration in his life. His companions and their extravagances no longer pleased him; gay were superseded by grave thoughts, and his attention frequently rested on religious subjects. This change restored to him the countenance of his friends; and his relations, the Baringtons and the Hampdens, interested themselves in arranging an union between Oliver, who had now completed his twenty-first year, and Elizabeth, the daughter of Sir James Bouchier, a lady wanting in personal attractions, but virtuous, sensible, and possessed of a moderate fortune. Soon after his marriage, his attachment to the Puritans first appeared, and his house at St. Ives became the retreat of the disaffected clergy. As the nation was extremely dissatisfied with the court, and Oliver Cromwell's aversion to it was known, he was elected member for the borough of Huntingdon in 1628: this parliament was of short duration. The king, by its impolitic speedy dissolution, still further irritated his enemies. Cromwell's house was more than ever frequented by Puritan preachers and their hearers. His opinions became so deeply rooted, that his hospitality to those who were of the same way of thinking increased his expenses until his circumstances became again so much embarrassed that a portion of his property was necessarily sold. Whether, after this sale, he was connected with a brewery is not clear: it is certain however that he became a farmer at St. Ives, but having no knowledge of agriculture, this speculation only increased his financial difficulties. Sir Thomas Stuart, his maternal uncle, dying (1636), Oliver became possessed under his will of property in the Isle of Ely amounting to nearly 500*l.* a year. His fortunes were thus partially retrieved: nevertheless in the

hope of better providing for his children, he determined in 1637 to emigrate to America, and having taken a passage to New England in a ship then lying in the Thames, embarked with his whole family. The vessel, however, was detained by a proclamation forbidding such embarkations, unless under a license from the government, which he knew that he should be unable to procure. Religion had at this time a very strong influence upon his mind; poor as he still was, we find that, from motives of conscience, he returned sums that in his youth he had won by gambling. He lived at Ely in retirement with his wife and children; but notwithstanding he saw few persons of importance, the activity and vigour of his understanding became generally known: his open advocacy of principles opposed to the government, and the zeal with which he resisted an unpopular attempt to drain some of the neighbouring Cambridgeshire fens, attracted the favourable regard of many public men. In such esteem was he held, that he was proposed for the representation of the town of Cambridge, and elected, though as some say by intrigue (*Noble's Mem.*, vol. i., iii.) in opposition to Counsellor Mewtis, the court candidate, both to the short-lived parliament of 1640, and afterwards to the Long Parliament, by which it was speedily followed.

Cromwell was now in the middle age of life; his health was strong, and his judgment matured: so far circumstances were favourable to his farther elevation. But he had deficiencies, not only in fortune, but in person and in knowledge, which precluded all foresight of the height to which he would rise. He had neither the address nor the appearance of a gentleman. He had resided so little in London, that he was wholly unacquainted with any of the leading men at court; he knew nothing of the ways of parliament or the method of government, and was altogether ignorant of foreign policy. The descriptions given of him on his entrance to the House of Commons, at the beginning of the Long Parliament, display in a striking manner his unpolished rusticity. Sir Philip Warwick gives the following minute account:—'The first time that I ever took notice of him was in the beginning of the parliament held in November, 1640, when I vainly thought myself a courtly young gentleman (for we courtiers valued ourselves much upon our good clothes). I came one morning into the house well clad, and perceived a gentleman speaking (whom I knew not), very ordinarily appareled; for it was a plain cloth suit, which seemed to have been made by an ill country tailor; his linen was plain, and not very clean; and I remember a speck or two of blood upon his little band, which was not much larger than his collar; his hat was without a hat-band; his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish, his voice sharp and untunable, and his eloquence full of fervour.' With the exception of his eloquence, this probably was a correct picture. Cromwell spoke certainly with fervour; but his biographers must be credited in their assertion that he had not the smallest pretension to rhetoric, but was confused and unintelligible in his address. In a somewhat intemperate sermon written after the Protector's death, Dr. South speaks of his appearance when attending the Long Parliament. 'Who,' says he, 'that beheld such a bankrupt beggarly fellow as Cromwell first entering the parliament-house, with a threadbare torn cloak and a greasy hat (and perhaps neither of them paid for), could have suspected that in the space of so few years he should, by the murder of one king and the banishment of another, ascend the throne, be invested in the royal robes, and want nothing of the state of a king but the changing his hat into a crown.' He had as yet had no opportunity for displaying the extent of his energy and abilities; the time was at hand when they were to be proved.

For an account of the discontents in the kingdom and the causes of the civil war, we must refer our readers to the copious histories of the time. The tyranny and maladministration of the weak and obstinate Charles became the subject (1641) of a violent remonstrance from his parliament, which at once insured their rupture with the king. Cromwell, now associated in the councils of Hampden, Pym, and the rest of the democratic leaders, strenuously supported this remonstrance; and in 1642, when the civil war commenced, eagerly raised a troop of horse, under the authority of the parliament, with which he immediately took the field in their cause. Notwithstanding the comparatively advanced age at which he first buckled on the

sword, all writers bear testimony to the military abilities that he displayed throughout the succession of battles between the parliamentary and royalist forces. At Marston Moor, at Stamford, and in the second battle of Newbury, he was especially distinguished. With the title of lieutenant-general of the horse he soon became, under Fairfax, the chief mover of a victorious army; and so valuable were his services considered by the parliament, that he was exempted from obedience to the 'self-denying ordinance'—an injunction which excluded the members of either house from holding any command in the army. This measure was brought forward by Cromwell's friends, who trusted to his popularity in the parliament, and the necessity that it had for his services, to procure an exception in his favour. The result fully answered their expectations; his rivals were set aside, his power more widely spread, and a greater scope given to his ambition. At the battle of Naseby (June, 1645) Cromwell commanded the right wing, and Ireton, his son-in-law, the left; the main body of the royalists was commanded by the king in person. As the troops were nearly equal, the event of the day was looked for by each side with anxious hope. Ireton was repulsed early in the day; but Cromwell and Fairfax, taking advantage of Prince Rupert's temerity, totally dispersed the king's infantry, and took his artillery and ammunition. Elated with victory, the parliamentary army, under the same leaders, vigorously prosecuted their success, until they had reduced most of the royalists in the west. Cromwell now (1646) found leisure to return to London; the thanks of the parliament were voted to him; his services were publicly acknowledged, and rewarded by a grant of 2500*l.* a year, to be raised from Lord Winchester's estates.

The king, who had passed the winter (1645-6) at Oxford, in a condition to the last degree disastrous and melancholy, in the month of May escaped from that city in disguise, and threw himself upon the protection of the Scottish army, then encamped at Newark. After some negotiations, he was basely delivered up by the Scots to the parliamentary commissioners, who kept him prisoner at Holdenby, in Northamptonshire. In proportion as the king's power had diminished, the division between the Independents and the Presbyterians had become daily more apparent. In the army, the majority, with Cromwell at their head, were Independents; in the parliament, Presbyterians. Each body, jealous of the other's power, began to strive for the mastery. At length the army rebelled against the parliament; and Cromwell, aware of the advantage that would be gained by the possession of the king's person, directed one Joyce, a young and enterprising soldier, to rescue the king from the hands of the commissioners of the parliament, and to deliver him to the army (1647). This scheme was quickly put into execution; Cromwell maintaining with refined hypocrisy that he deeply regretted the disaffection which the army showed towards the parliament. The members, however, were not deceived. The Presbyterian leaders resolved, as soon as he should come into the House of Commons, to accuse the lieutenant-general of having promoted this schism, and to commit him to the Tower. Intelligence of these proceedings was quickly carried to the army; and Cromwell, perceiving that the crisis was desperate, and that some decided step must instantly be taken, hastened to the camp, where he dexterously procured himself to be invested with the chief command, and then, threatening the unpopular parliament, marched southwards to St. Alban's.

As long as there remained any balance between the rival powers in the state, each sought the support of the royalists, and the king's cause appeared not altogether hopeless; he was courted by the Presbyterians and deceitfully flattered by Cromwell. But when the leaders of the army established their dominion, the case was altered. At a conference at Windsor, opened with prayers poured forth by Cromwell himself with all the cant of fanaticism, he opened the daring counsel of punishing the king by judicial sentence. The time, however, was not quite at hand for this bold measure. The king was left in custody in the Isle of Wight, and Cromwell again took the field against the Scots in the north and the Welsh in the west, making preparations at the same time to resist an invasion from Holland threatened by Prince Rupert, to whom seventeen English ships had deserted. Again he was victorious; and his army returned to London, where they broke violently into the parliament-house while the mem-

bers were in debate, seizing some, and excluding others, by the direction of Colonel Pride. The king's trial now (1649) commenced, and in proportion as violence increased the greater were the pretensions to sanctity. Cromwell declared to the house, 'Should any one have voluntarily proposed to bring the king to punishment, I should have regarded him as the greatest traitor; but since Providence and necessity have cast us upon it, I will pray to God for a blessing on your counsels, though I am not prepared to give you any advice. Even I myself, when I was lately offering up petitions for his majesty's restoration, felt my tongue cleave to the roof of my mouth, and considered this preternatural movement as the answer which Heaven, having rejected the king, had sent to my supplications.' (Hume.) The circumstances attending the king's trial are well known. Cromwell took an open undisguised part, and, with Ireton and Harrison, was named by the dregs of the parliament among the 133 persons chosen to constitute the tribunal. One half of this number were usually absent: but Cromwell's interest in the result was so deep that he was always present in the court. The sentence was passed, and he signed the warrant for the execution. He was now beset with entreaties to spare the king's life. To the intercessions of his son Richard he would scarcely listen with patience; to his cousin Col. Cromwell he would only reply, 'Go to rest, and expect no answer to carry to the prince, for the council of officers have been seeking God, as I also have done, and it is resolved by them all that the king must die.' The execution followed accordingly. Five days afterwards the House of Lords was voted useless, and a council of state was formed, with Bradshaw for president and Cromwell a principal member. Difficulties soon crowded round their government. A mutiny broke out in the army, which required the immediate presence of the lieutenant-general. Some regiments were pacified with little trouble, and became submissive after the execution of the ringleaders; but others continued to resist. At length Cromwell offered them a treaty, which they had no sooner accepted than he faithlessly put a large portion of them to death. By these means peace was restored.

In Ireland the majority were still hostile to the parliament, and an army had been sent there to reduce the royalists to submission. Cromwell joined the troops in August, 1649: he besieged and took Drogheda, gave no quarter to the garrison, and proceeded to capture Wexford, Kilkenny, and Clonmell. In nine months the country was nearly subdued. Satisfied with his success, he left to Ireton the conduct of the troops against his panic-struck adversaries; and having sailed for Bristol, proceeded to London, where he was received with fresh honours by the parliament.

The children of the late king had suffered deeply from their fallen fortunes: one had died of grief at her father's execution, another had been sent out of the kingdom by Cromwell, and Prince Charles, the heir to the crown, poor and neglected, had lived sometimes in Holland, at other times either in Jersey or in France. At length he was induced by the Scottish army to take shelter among them, a protection which he bought by subscription to the covenant and submission to restrictions so severe as almost to render him a prisoner. Whatever might be the circumstances under which this junction was formed, the return of Charles to his kingdom could not fail to alarm the English. It was instantly resolved to march northward with all the troops that could be raised. Fairfax, himself a presbyterian, refused to lead the forces, and Cromwell was therefore nominated to the command, and became the general of the commonwealth. This vast accession to his power induced him to resign the lieutenantancy of Ireland, to which he had previously been appointed: perhaps a view of removing Ludlow to that post formed an additional reason for his withdrawal. Cromwell was jealous of the influence of Ludlow, who, though he did not receive this appointment, was ultimately set aside by his promotion to an official situation in that kingdom. After these and other preparations, he began his march with 16,000 men (1650). The miscarriage of provisions was at first severely felt; but when supplies arrived the troops regained their courage. The battle of Dunbar was gained by the English, and Edinburgh and Perth were taken. Upon this the king suddenly marched into England. Cromwell, who had not expected this movement, sent expresses to the parliament to inform

them of what had taken place, and with forced marches pursuing the king, brought him to an engagement near Worcester, the result of which was a total defeat of the royalists (September, 1651). For this complete victory the parliament rewarded him with fresh honours and an additional pension of 4000*l.* a year.

How early Cromwell thought of taking into his hands the reins of government cannot be determined: whatever views or wishes of this kind he might have felt, they were not expressed, even to his friends, until after the battle of Worcester. Now however his mind was bent upon this object; but for some time no favourable opportunities presented themselves. The war with Holland occupied his attention and engrossed the thoughts of the nation. At length (1653), perceiving that the parliament became daily more jealous of his power, he determined to put an end to their authority. He first sent them a remonstrance; his next movement was to enter the House with an armed force, seize the mace, and to declare to them, 'You are no longer a parliament: the Lord has done with you; he has chosen other instruments for carrying on his work.' Loading the members with abuse, calling them adulterers, extortioners, drunkards, and gluttons, he drove them before him out of the House. Thus was the memorable 'Long Parliament' dissolved. The next step was to summon by name 139 persons, some gentry, some mechanics, all the very dregs of the fanatics, and to constitute them a parliament. It was obvious that such an assembly could in no way assist in the government of the realm; one measure only seemed to be expected from them, and that they quickly determined upon; it was to surrender their power to Cromwell, who, after their voluntary resignation, was declared 'Protector' by a council of the officers of his army, and solemnly installed into his dignity (1653).

The first charter of the Commonwealth was drawn up in December, 1653, by the same council of officers: it was called the 'Instrument of Government.' The second, called the 'Petition and Advice,' was framed in May, 1657, by the Parliament which the Protector had assembled in the previous year. Under the first charter, the English government may be ranged among republics, with a chief magistrate at its head. Under the second it became substantially a monarchy, and Oliver Cromwell, from 1657 to his death, was *de facto* king of England. (Hallam, *Cons. His.* ii. 421.) The difficulties of his administration were great, but they were surmounted by his vigorous abilities, which shone forth as much in wielding his power as in obtaining it. That he was both arbitrary and despotic cannot be denied. Such was the temper of the country, and, notwithstanding his general popularity, such the number of his open or secret enemies, that immediate and forcible action, though sometimes illegal and tyrannical, was absolutely required. The morality of his conduct cannot for a moment be defended. But if he would continue Protector there was little room to be scrupulous. There were opposed to him the royalists, who were still numerous; the nobility, to whom he was hateful; the whole body of Presbyterians, who were jealous of having no share in the power which they had helped to gain; and in the army, the mutinous and disaffected 'Levellers.' Severe measures then were requisite, and at times they certainly were used, not however without apparent reluctance. 'Cromwell's general policy,' says Sir Walter Scott (*Tales of a Grandfather*, vol. iii.), 'was to balance parties against each other, and to make each desirous of the subsistence of his authority rather than run the risk of seeing it changed for some other than their own.' The point that seemed most to perplex him was the calling together of parliaments: he would neither reign with them nor without them. He abruptly dissolved the House in 1654, in direct contradiction to the advice of Whitelock and his friends generally, who recollected the abuse that had been poured upon King Charles under similar circumstances. It was not the wish to attain an absolute despotism that prompted him to these acts, but rather an impatience at the opposition that he was sure to experience in their councils. In 1656 his successes at home and abroad encouraged him to assemble another parliament. Ireland being in the hands of the army, elected such officers as he nominated; Scotland was nearly equally subservient to him; still the majority was unfavourable to his policy. The next step was difficult. He ordered the doors of the House of Commons to be guarded, and that no member should be admitted unless he produced an order from his

council. Thus he excluded nearly one hundred members who were obnoxious to him. Thus 'purified,' this assembly voted a renunciation of all title to the throne in the family of the Stuarts; and Colonel Jephson moved that the crown should be bestowed upon Cromwell. A conference was soon afterwards appointed (1657), at which the Protector's scruples respecting the assumption of the title of king were stated and argued: it was seen that his mind was wavering whether he should accept or whether he should forbear. But his prudence ultimately prevailed; he knew that the danger of acceding would be imminent, while the increase of power would be trifling; the odium in which the army had been taught to hold the regal title could never be overcome, and therefore he consented unwillingly to reject it.

As Cromwell's treatment of his parliaments was arbitrary, so also were his dealings with the courts of justice. He degraded three judges without just cause, and so intimidated the barristers that they feared to uphold clients whose causes were contrary to the Protector's wishes. To give an instance of this oppression—One Cory having refused to pay the unjust and exorbitant tax of ten per cent. which was ordered to be levied upon the property of all royalists, sued the collector. Three eminent counsel, Maynard, Twisden, and Wyndham, were employed in his cause, but Cromwell, without suffering them to enter into their argument, sent them to the Tower even for accepting the brief. Sir Peter Wentworth having brought a similar action, was asked by the council if he would give it up; 'If you command me,' he replied to Cromwell, 'I must submit;' the Protector did command, and the action was withdrawn. Equally shameless were the means which were used for the erection of the courts, by which, in 1654, Gerard and Vowel, and, in 1658, Slingsby and Hewit, were brought to the scaffold. These, and other similar acts, rendered Cromwell hateful to many of his subjects. He had suppressed some royalist insurrections at Salisbury, and executed the leaders in 1655; but now he entertained fears from the republicans also. Major Wildman, a republican, was arrested for a conspiracy against him; and such was the ill-will shown to him by the democratic soldiery as to cause anxiety for his personal safety. One Sindercome, who by an accident alone had been prevented from murdering him, was arrested and condemned; but to the disappointment of Cromwell, who eagerly desired to make a public example, the criminal committed suicide before the day appointed for his execution.

The foreign policy of the Protector has been variously estimated. It seems to have been imprudent but magnanimous, enterprising, and ultimately successful. 'Perhaps no government,' says Sir Walter Scott (*Tales of a Grandfather*), 'was ever more respected abroad.' Many memorable victories were achieved under the parliament and under Cromwell. 'It is just to say,' observes Mr. Hallam (*Const. Hist.*, vol. ii.), 'that the maritime glory of England may first be traced from the era of the Commonwealth in a track of continuous light.' A treaty, consequent on the successes of Blake, was honourably concluded with the Dutch. An expedition, more politic than just, was made against the West Indian colonies of Spain; it ended in failure and disappointment, although it gained for England the island of Jamaica, a greater and more advantageous possession than many triumphs have produced. An alliance was concluded with France in 1655 to act in conjunction against the Spanish forces in the Low Countries; Mardyke and Dunkirk were taken, and the Spaniards were afterwards wholly defeated at Dunes. Denmark, Portugal, and Sweden, eagerly sought the Protector's friendship; ambassadors flocked to his court, bearing the most conciliatory and adulatory messages.

The anxiety of all princes to be allied with so recent an usurper is very remarkable. The servility of some powers was extreme, as has been proved by several curious instances which have been collected by Mr. Harris. (*Life of Cromwell*, p. 352.)

Whether Cromwell could have maintained his authority for many years is doubtful; the prevalent discontents induce us to believe that he could not. 'He became,' says Sir Walter Scott (*Tales of a Grandfather*), 'morose and melancholy, always wore secret armour under his ordinary dress, and never stirred abroad unless surrounded with guards, never returned by the same road nor slept thrice in the same apartment from the dread of assassination; his

health broke down under these gloomy apprehensions; and on the 3rd September, 1658 (the anniversary of his victories at Dunbar and Worcester, and several other important events of his life), he died of fever and tertian ague, in the sixtieth year of his age. His burial was conducted with unusual pomp and magnificence at Westminster: but his corpse was not suffered to rest in peace. At the Restoration it was disinterred by the Royalists, and, having been hung at Tyburn, was cast into a hole beneath the gallows.'

Of the numerous characters of Oliver Cromwell that have been drawn by various historians, none appears to us as a whole to be more faithful than that of Dr. Smollet. (*Hist. of England*.) It should nevertheless be recollected that the bias of the writer was strongly in favour of the high prerogative of the crown. Cromwell 'inherited great talents from nature; though they were such as he could not have exerted to advantage at any juncture but that of a civil war inflamed by religious contests. His character was formed from an amazing conjunction of enthusiasm, hypocrisy, and ambition. He was possessed of courage and resolution that overlooked all dangers, and saw no difficulties. He dived into the characters of mankind with wonderful sagacity, whilst he concealed his own purposes under the impenetrable shield of dissimulation. He reconciled the most atrocious crimes to the most rigid notions of religious obligations. From the severest exercise of devotion he relaxed into the most ludicrous and idle buffoonery. He preserved the dignity and distance of his character in the midst of the coarsest familiarity. He was cruel and tyrannical from policy, just and temperate from inclination, perplexed and despicable in his discourse, clear and consummate in his designs, ridiculous in his reveries, respectable in his conduct; in a word, the strangest compound of villany and virtue, baseness and magnanimity, absurdity and good sense, that we find upon record in the annals of mankind.'

The resemblance between the fortunes of Cromwell and of him who in more recent times raised himself from insignificance to a throne, is strong enough to strike the generality of readers. Mr. Hallam has stated (*Cons. Hist.*) the most striking points in the parallel. But the conclusion of Bonaparte's life was very unlike that of the Protector; the fortunes of one had declined for years before his death, the other retained his authority to the last hour.

Cromwell was not wanting in kindness towards his family, and always showed great affection towards his wife and children. He was once married; six children, two sons, and four daughters, survived him. Of the daughters, Bridget was twice married, first to Ireton, and afterwards to Fleetwood. Elizabeth was the wife of John Clayton, Esq.; Mary married Lord Fauconberg, and Frances was wife first to Mr. Rich and afterwards to Sir John Russell of Chippenham.

(Clarendon's *Hist. of Rebellion*; Hallam's *Cons. Hist.*; Noble's *Memoirs of Cromwell's family*; *Tracts on the Civil Wars*; Harris's *Life of Oliver Cromwell*; Crit. Review of *Life of Oliver Cromwell*; *Biog. Brit.*; *Biog. Univer.*; W. Scott's *Tales of a Grandfather*; Villemain's *Hist. de Crom.*; Smollett's and other Histories.)

CROMWELL, RICHARD, the third son of Oliver Cromwell the Protector, but the eldest that survived him, was born at Huntingdon on the 4th of October, 1626. He was educated at Felsted in Essex, with his brothers Henry and Oliver, and thence removed to Lincoln's Inn, where he was admitted in 1647. His study of the law was only nominal, for the time which he should have occupied with reading was wasted in the pursuit of pleasure. Although he had now arrived at an age when it would have been most natural for him to have desired to join his father's troops, we do not find that he showed any inclination to do so. Besides indolence and apathy, many causes have been assigned for this want of enterprise; some have supposed that his father would not suffer him to take arms; others, that Richard Cromwell's political opinions differed from the Protector's; and that as his companions were chiefly cavaliers, and the king's health had often been drank at their carousals, he was favourable to the Royal rather than the Parliamentary cause. There is, however no very clear evidence to prove this last fact, unless we may reckon as such the fact that Richard, averse to spilling blood, when the king was condemned, petitioned his father for a remission of the sentence.

At the age of twenty-three he married Dorothy, the eldest daughter of Richard Major, Esq. of Hursley, in

Hampshire, a lady sprung from a good family, endowed with many virtues, and possessed of a considerable fortune. This change in his circumstances induced him to leave his residence in London, and to establish himself at Hursley, where he lived in complete retirement, following the sports of the field and other rural pursuits. Oliver Cromwell, until he was made Protector, was unwilling to advance his son, for fear of giving umbrage to the republican party. No sooner, however, was that dignity conferred upon him, than calling Richard from his obscurity, he nominated him for the counties of Monmouth and Southampton, for which he was elected in 1654. His appointment as first lord of trade and navigation followed his election. In 1656, he was again chosen member of parliament for Hampshire and the University of Cambridge; and in the following year succeeded his father in the chancellorship of Oxford.

An accident now befel him which nearly cost him his life. After a levee held by the Protector, whilst he and other members of parliament were standing on the upper steps within the banqueting-house, the supports gave way, and the whole staircase fell with an alarming crash; youth and a good constitution alone enabled him to recover from the fractures and other injuries that he sustained. After his health was restored, his father, still anxious for his elevation, made him a privy councillor, a colonel in the army, and leader of the newly constituted House of Lords. The reign of Oliver Cromwell was now drawing to a close; both his mind and body were overwrought by the strain of continual exertion; and in the summer of 1658, he sent for his eldest son to attend him in his sickness. Richard Cromwell immediately obeyed the summons, and found the symptoms of his father's illness such as to make him extremely apprehensive for its result; in a letter written in August to a friend near Abingdon (*Parl. Hist.* 21, p. 223), he expresses in feeling and sensible terms the fears which he entertained for his life. On the 3rd of September 1658, Oliver Cromwell died, and on the next day Richard Cromwell received the sceptre of the commonwealth.

For a short time the peace of the kingdom was undisturbed, and respect was paid to the new Protector at home by his subjects, and abroad by all foreign states. Thurloe, Whitelock, and Broghill were his chief counsellors, and it must be confessed, when all the attendant circumstances are considered, their advice was none other than judicious. But tranquillity could not long be maintained: the aspect of affairs very soon began to change. Discontents prevailed; the want of resources was felt; it became necessary to call a parliament (1659), for there was in the treasury no money with which to fulfil the engagements with foreign princes that had been entered into by the late Protector. It was feared that the elections would go against the court: and every means were therefore taken to bias them. Oliver Cromwell's reformed model of representation was abandoned, and the right of returning members was restored to small boroughs, which, from gratitude, it was thought would be favourable to the court: but notwithstanding this, and all the other efforts of the government, the number of presbyterian and republican members nearly equalled that of the ministerial party. In the parliament, then, the weakness of the Protector's government was most apparent. Still it was to this body that he must trust: for in the army he had scarce any friends at all; the whole republican party were combining against his authority; Lambert was intriguing for his overthrow: even Fleetwood, his own brother-in-law, joined the discontented officers, whose faction, from the name of Fleetwood's house, in which they met, was called the 'Cabal of Wallingford House.' Richard, who possessed neither penetration nor resolution, took no step to subdue these rebels: the parliament, more alarmed, took the case into their hands. A vote was passed that no council of officers should assemble without the Protector's consent: this brought the rupture to a crisis. The army demanded the dissolution of the parliament, which the Protector wanted resolution to deny. The dissolution was equivalent to his dethronement, and he soon afterwards signed his demission in form (22nd April, 1659). His brief reign ended, Richard Cromwell descended into humble life, to the enjoyment of which his feeble unambitious character was better adapted than to the possession of power. He had no qualities which fitted him to rule. He was burdened with debts, arising partly from the pompous funeral of his father, the cost of which, amounting to 28,000*l.*, the state unworthily suffered to descend upon him. To assist him in

these difficulties, the parliament voted him 20,000*l.*, annexing a condition that he should leave the palace of Whitehall. In consequence of this grant he retired to Hampton Court, but so small a portion of the money was paid, that he was still in danger of being arrested by his creditors. To leave England was his only method of escape from them, and accordingly he resided sometimes in Geneva and sometimes at Paris. At length he ventured to return to this country: a house was hired for him at Cheshunt, near London, where at first he concealed himself under a feigned name, and continued to live in strict privacy, until the year 1712, when he died in his 86th year.

Richard Cromwell was the father of two sons and seven daughters: four of his children died young, and two only survived him: he had great reason to complain of their undutiful behaviour. It has been remarked that there exists no coin or medal stamped in his reign: perhaps this may be accounted for by his never having been solemnly instituted Protector. (*Hallam's Const. Hist.*; *Noble's Memoirs*; *Hume's Hist.*; *Biog. Brit.*, &c.)

CROMWELL, HENRY, the fourth son of Oliver Cromwell, Lord Protector, but the second and youngest that survived him, was born at Huntingdon in January, 1627-8. He was educated at Felsted in Essex, and enrolled in the parliamentary army at the age of sixteen. In 1649, having become a colonel, he went with his father to Ireland, where he behaved with considerable gallantry. He was one of the members for that kingdom in the Bare-Bones Parliament. He married, in 1653, a daughter of Sir Francis Russell of Chippenham in Cambridgeshire, and resided at Whitehall until he was appointed Lord Deputy of Ireland, being at the time (1654) a member for the University of Cambridge. During the following year he was again sent to Ireland. It had become absolutely necessary that the estates and property of the natives should be protected from the rapacity of the republican leaders, who were aggrandizing themselves at their expense; and Henry Cromwell was considered a fit person to undertake this task, both on account of his general abilities, and the great esteem in which he was held in that country. The expectations of his friends were not disappointed, for the state received considerable benefit from his services, as soon as he succeeded Fleetwood in his office. The impossibility of procuring money from England, and the limitations of his power, materially diminished his usefulness. At length, from these causes, his government became so irksome to him, that his letters are one series of complaints, interspersed with offers to resign. Still further mortification, however, was in store for him. When his brother Richard became Protector, the council, over which he had little or no control, contracted still further the power of Henry Cromwell, who, in exchange for the title of Lord Deputy, received that of Lord Lieutenant, a miserable recompense for his lost authority.

After the deposition of his brother, Henry Cromwell was desirous of keeping Ireland for the king, and it was not until his submission was forcibly required by the parliament that his object was finally relinquished. Henry now retired to Chippenham, whence, in five or six years, he removed to his estate at Soham in Cambridgeshire, where he spent the remainder of his days, and died at the age of forty-six (1673-4). There were many excellent qualities in his character: he was generous, honest, decisive, firm, and courageous. 'All historians,' says Rapin, 'are unanimous in their praise of him, and generally believe, that if he had been Protector instead of his elder brother, the officers would either have met their match, or not attempted what they did against Richard.' Henry Cromwell had five sons and two daughters: one of his children died young; the rest survived him.

CRONSTADT (Bartza Videka), a large county in the south-eastern part of Transylvania, and in that part of it called 'the Land of the Saxons.' It is also denominated Burzenland, or Burezelland (from the river Burze), and Bartzasag. It lies immediately to the north of Wallachia, and has an area of about 787 square miles. It contains 1 free city, 4 market-towns, 26 villages, and about 13,260 houses. The county is traversed by the lofty chain of the Butchescht, an arm of the Carpathians, of which the Butchescht itself is 8160 feet high. On the side towards Wallachia it is completely inclosed by the Carpathian mountains, across which lead four principal passes, called the Torzburg, Temesch, Altschanz, and Bosau. The principal river is the

Alt, which receives the waters of the Burze and several other streams. The climate, though temperate, is variable, and extremely cold during the prevalence of the east wind.

The soil produces all sorts of grain and pulse, maize, millet, flax, hemp, fruits, and wood; also gold, silver, lead, and porcelain-earth; mineral springs abound, and there are several lakes, the banks and beds of which yield soda. The country is rich in game, fish, and bees; there are large herds of horned cattle; and much timber is obtained from the forests. Agricultural pursuits constitute the chief employment of the inhabitants. The population, which amounts to about 80,900, is composed of Saxons, Magyars, Wallachians, Greeks, Armenians, and some Kalibassi, the only people of that race in Transylvania. The district is divided into 3 fiscal circles, and 4 seignorial circles. The 4 market-towns are Marienburg, or Foldoár (1700 inhabitants), Rosenau (or Rosnyo) castle (2 churches, and 3300 inhabitants), Tottlau (Prashmar) (2 churches and 3000 inhabitants), and Zeiden, or Fekete Kalam (2 churches, and 3200 inhabitants).

CRONSTADT, the capital of the county of the same name, and the largest and most populous town of Transylvania, is called by the inhabitants Kruhnén, by other Saxons, Krünne and Krohne, and in antient records, Brassó. It lies in $35^{\circ} 36'$ N. lat., and $25^{\circ} 33'$ E. long., in a narrow valley, inclosed by mountains, at an elevation of 1896 feet above the level of the sea. It is defended by a strong castle on the banks of the Farkas. The inner town, which is in the form of a rectangle, is well-built, and surrounded with towers, walls, and ditches; it contains about 615 houses, and has a population composed entirely of Saxons or their descendants. The inner town was built in the beginning of the fourteenth century, when it was called Corona. There are three suburbs, the Altstadt, the Bollunya, or Brassovia, and the Upper Town, or Bolgár, which consists of 1500 houses, partly built on hills amidst orchards and gardens, and inhabited chiefly by Wallachians. Including these suburbs, Cronstadt has above 3400 houses, and nearly 36,000 inhabitants. The inner town has five gates, six principal streets, which are straight and regular, and a spacious market-place with two fountains. Among the chief buildings are the Protestant high church, a striking edifice, erected in 1383, in the Gothic style. It is 112 paces long, 59 broad, supported by 22 Tuscan columns, and surmounted by a tower 138 feet high, in which is a bell $6\frac{1}{2}$ tons in weight. The Roman Catholic church of Peter and Paul was built in the Italian style in 1766—82. The remaining buildings of note are the town-hall in the market-place, with a handsome tower, the old Lutheran church of St. Bartholomew, the gymnasium, and the great mart, or Kaufhaus, which was erected by Apollonia Hirschin, the wife of the sheriff, in 1545. This mart is the general place of rendezvous for merchants of all nations, Saxons, Hungarians, Armenians, Greeks, Turks, Wallachians, Jews, Gipsies, and Bulgarians, who assemble here to expose their goods, while Turkish money-changers are seated outside and around the market-place for the exchange of Austrian and Turkish coins.

Cronstadt contains a Lutheran gymnasium with a library, a Roman Catholic high (*primar*) school, a military academy, a normal school, besides various elementary and girls' schools, two hospitals, a house of correction, and a house of industry.

The inhabitants, among whom are many gipsy labourers, carry on considerable manufactures, especially cloth, of which above 40,000 pieces are annually made, linens, cottons, coarse woollens; stockings are also manufactured, and form a branch of trade with Wallachia; flasks of maple wood, of which above 30,000 are annually sent to Wallachia, Hungary, and Slavonia; woollen bobbins, of which 200,000 pieces are sent by Greek merchants to Asia Minor, &c. There is a paper-mill, and two wax bleaching grounds. Cronstadt was the first place in Transylvania where a paper-mill and printing-press were established; the earliest works issued from the latter were the 'Augsburg Confession' and the writings of Luther.

Cronstadt is the first commercial town of Transylvania, and carries on a considerable transit trade in Austrian and Turkish produce, principally cattle and wine from Wallachia; manufactured goods, corn, salt, &c., of which the annual circulation is from 500,000*l.* to 600,000*l.* The business is chiefly transacted by the Greek trading company, and at large annual fairs.

CRONSTADT, a town, fortress, and port, in the Russian government of St. Petersburg, from which city it is forty-

seven versts, or about thirty-one miles distant, is situated in $59^{\circ} 58'$ N. lat., and $25^{\circ} 49'$ E. long.: it is built at the south-eastern extremity of Cotlin-Ostrof, an island in that part of the Gulf of Finland called the Bay of Cronstadt, about sixteen miles from the mouth of the Neva. This island, a bed of chalk, formerly called Rétouzari by the Finlanders, is seven miles in length and about one mile in breadth. At the entrance of the harbour, on an island opposite the citadel, lies the fortress of Cronschlott, built by Peter the Great. The passage between this fortress and Cronstadt is 2000 paces in width, and has ample depth for the largest vessels.

Besides its importance as the great naval station of the Russian fleet, Cronstadt is the harbour of St. Petersburg. All vessels proceeding to that port are searched here, and their cargoes sealed, and such as are too large for the shallow waters of the upper Neva unload their cargoes at Cronstadt, and transport them in smaller craft.

Cronstadt, which is built in the form of an irregular triangle, is strongly fortified on all sides. It has three harbours, lying to the south of the town; the outer or military harbour, which is entirely surrounded by a massive and strongly fortified mole, is a rectangle, stretching out into the sea, and is capable of containing, besides smaller vessels, above thirty-five ships of the line. It is now however so shallow at low water, that many of the ships are obliged to anchor in the middle harbour, which is properly intended for the fitting out and repairing of vessels. It contains the slips, a powder-magazine, a manufactory of pitch, tar, &c. The third and innermost harbour, which has space for 1000 vessels, and runs parallel with the middle harbour, admits only merchantmen, for which there is besides an excellent roadstead immediately outside of the port, which is defended also by the citadel, constructed on a rock in the middle of the sea of Cronstadt.

All these harbours are well secured, but in consequence of the freshness of the sea-water no vessels can be preserved in them above twenty years. They are besides detained a great part of the year by the ice in the bay of Cronstadt, which usually prevents vessels from entering after the end of November, or leaving before the end of April, or sometimes even later. Vessels are repaired and built in the large canal of Peter the Great, which runs directly into the town between the middle and merchant's harbour. It is 2160 feet long, 56 wide, and 26 deep; the side abutments, &c. are of solid masonry, and it is filled with water by means of sluices, which is again pumped out by steam-engines. It was commenced in 1721, and finished by Elizabeth. Near it are the various docks, in which ten ships can be repaired at once; the foundry, which supplies annually 1200 tons of bombs, balls, &c.; the admiralty rope-walk, tar-works, and excellent wet docks. By the new Catharine Canal, commenced in 1782, which is 1880 fathoms long, government vessels are enabled to take their stores, munition, &c. directly from the store-houses. The town is very regularly built, and contains many fine, straight, and well-paved streets, and several public squares. The houses however, with the exception of those belonging to government, are chiefly of one story, and built of wood. There are three churches and two chapels of the Greek worship; that of the Transfiguration, built of wood by Peter the Great, is very large, and covered with images; that of the Trinity is of older date; St. Andrew's church is in the Byzantine taste, and surmounted by a handsome cupola. There is a Lutheran, an Anglican, and a Roman Catholic church.

The city has three gates, and is divided into two parts, the Commandant and Admiralty quarters, which are subdivided into four districts. Between the Peter's and Catharine canal is the old Italian palace built by Prince Menschikof, who took this island from the Swedes in 1703. It is at present occupied by the school for pilots, a large establishment, where above 300 pupils are educated for the naval service, and 20 for the merchant service. The naval hospital is a large and well-regulated institution, with accommodation for 2500 patients, and a separate building for officers of the navy. Among other public buildings we may mention the admiralty, exchange, custom-house, barracks, a Protestant gymnasium, various schools, an invalid asylum for 60 females, the nobility's club, and the house of Peter the Great, where he resided for some time: but with the exception of a few old oaks, which he is said to have planted with his own hand, there are no remains of the former garden.

The permanent population of Cronstadt, exclusive of the garrison, the pupils of the naval school, workmen, and sailors, is not considerable; during the summer it amounts to upwards of 40,000 individuals of various nations; of these, next to the Russians, the English are the most numerous. The inhabitants derive their chief support from the fleet, trade, and shipping. The town presents an appearance of great bustle and activity during the summer, but in winter all is dead and stagnant.

The town and port were laid out and the buildings far advanced by Peter the Great, who founded Cronstadt in 1710; but it did not receive its present name ('the town of the crown') until the year 1721. At the northern extremity of the island are Fort Alexander and the battery of St. John; the latter is built on piles in the Neva.

CROOKED ISLANDS, a group similar to the Caicos, situated on a coral bank, 23 miles to the eastward of Long Island, on the Great Bahama Bank. They consist of three large islands, called Crooked, Acklin's, and Fortune, besides several small keys and rocks. The edge of the bank, like most others in these seas, rises abruptly from a depth of upwards of 100 fathoms all round; and the highest land is only 200 feet above the sea. These islands form a part of the Bahama government. At the south-west end of Crooked Island there is an unsafe anchorage, with a custom-house and post-office, where the Bahama mail is left, and taken up by the Jamaica packet monthly on her voyage home. The population is very scanty, and supplies are scarce and dear; but a stock of turtle is constantly kept in ponds. The bank is contained between the parallels of $22^{\circ} 5'$ and $22^{\circ} 50'$ N. lat. and the meridians of $73^{\circ} 50'$ and $74^{\circ} 30'$ W. long.

CROPS, ROTATION OF. [ARABLE LAND.]

CROSIER, from *Crocias*, in the Latin of the middle age, a pastoral crook or staff, formerly used by bishops and abbots. Several writers have supposed (see Macklain's *Note to Mosheim's Eccles. History*, edit. 1758, vol. i. p. 319; and the *Antiquarian Repertory*, 1st edit. ii. p. 164) that it was derived from the *lituus*, or augural staff of the Romans: but they are mistaken. It was evidently copied from the well-known and common staff which shepherds, even to this day, make use of to catch hold of the hinder leg of their sheep in order to take them; and it has reference to the pastoral office of the bishops and clergy, according to the words of our Saviour, 'I am the good shepherd,' and to the common name of the clergy, pastors or shepherds.

These pastoral crooks were sometimes barely curled, and at others very richly ornamented; a few instances occur in which the upper part finishes in the form of a mace. The *Sieur de Moteon*, in his '*Voyages Liturgiques de France*,' 8vo. Par. 1718, p. 272, says, many of the early crosiers were not curved. The abbot's staff was usually of a simpler form than that of the bishop. One of the earliest abbatial staffs, the form of which can be seen in England, is probably that represented on the tomb of abbot Vitalis, in the cloister of Westminster Abbey, who died in 1082. The most splendid episcopal crosier remaining is that of William of Wykeham, of silver gilt, richly enamelled, which is exhibited to visitors in the chapel of New College, Oxford, to the society of which the bishop himself bequeathed it in 1404. (See *Lowth's Life of Wykeham*, 3rd edit. 8vo. Oxf. 1777, p. 263, where it is engraved.) Crosiers in wood in antient times were usually buried with bishops and abbots in their coffins: such a one, of red wood, the top carved into the rude form of a ram's head, was found many years ago, upon opening the coffin of bishop Grosteste at Lincoln, who died in 1253. It lay across the body from the right shoulder to the left foot. At the bottom of the neck of this staff, upon a brass plate, was this inscription: 'Per baculi formam Prelati discito normam.' (Gough, *Sepulchr. Mon.* vol. i. p. 47.)

CROSNO, an antient royal town in the circle of Jaslo, in the north-eastern part of Austrian Galicia, lying in a beautiful and fertile valley between the Wyslaka and Morava. It contains upwards of 600 houses, with about 5000 inhabitants; an old palace, a chapter-house, a handsome Gothic collegiate church, built on the foundations of a place of Arian worship, a Capuchin monastery of freestone, a Minorite cloister, and an hospital. The people are much engaged in the manufacture of inferior articles; the fairs are numerous attended, and it is a place of deposit for the wines of Hungary consumed in Galicia.

CROSS. Various religious edifices called crosses, from their being surmounted with this emblem of Christianity, have been erected in England and on the continent. Of these the most remarkable in England are those built by the command of Edward I. in memory of his queen Eleanor. Three of these still remain, at Geddington, Northampton, and Waltham Cross, near London. The last, which is the most elegant, consists of four stories. It is hexagonal on the ground plan, and beautifully enriched; the story immediately above this is supported by buttresses, and formed into niches in which are three figures of the queen. The core at the back of the figures is carried up beyond the niches, and has been restored with a battlement and a cross sustained on a crocketed spire. Churches have usually crosses fixed on their gable ends. Market-crosses were formerly very common in England. They are often designed with niches and vaulted, thus forming an open chamber, as at Salisbury and Chichester. Winchester-cross, which is one of the most perfect of the crosses erected for religious purposes, is of much later date than those erected by Edward I. Near Ely, on the road to Downham-market, there is a singular cross, consisting of a long slender stone shaft, on the top of which there are richly carved niches projecting beyond the sides of the shaft. There is a representation of a cross on some terra cotta lamps in the British Museum. The largest constructed crosses are those of St. Peter's at Rome and St. Paul's, London.

In some of the Catholic processions in Rome enormous crosses, constructed of wood and card-board, are carried, balanced in a waistband round the body of a strong man.

CROSS, from the Latin '*Crux*.' This cruel mode of punishment appears to have been in use from the earliest recorded periods of history. It was possibly the invention of some barbarous tribe to prevent the escape of a captive by fastening him to a tree, or used to inflict death on an enemy by leaving him to expire of want, or a prey to birds and beasts.

Crosses, whatever was the original form, were, in course of time, made of two pieces of wood. These crosses have been divided by antiquarians into three kinds. The *crux decussata*, or cross divided like the letter X, and usually called St. Andrew's cross; the *crux commissa*, or joined cross, consisting of an upright piece of timber with a transverse piece on the extreme top at right angles with the first, like the letter T; and the *crux immissa*, or let-in cross, in which the transverse piece of timber is let into the upright, but placed somewhat below the top of the upright in this form + . This is the cross on which Christ is usually represented to have suffered, and though there may not be any absolute authority for ascertaining the precise form of the cross used on that occasion, yet the circumstance of an inscription having been placed over his head renders the conjecture probable.

Amongst the Carthaginians, persons of all conditions, even commanders of armies, were subjected to it, but amongst the Romans it was considered as the punishment of slaves, and inflicted on that class only. With respect to the Jews, it seems doubtful whether crucifixion, as we understand it, was a mode of punishment used by them in antient times. The putting the sons of Saul to death by the Gibeonites has been adduced as furnishing evidence that crucifixion was practised by them (2 Samuel, cap. 21); but the practice does not seem to warrant the conclusion. It is however to be observed that the term 'hanging on a tree' is used in Scripture to describe crucifixion. (*Acts*, 10th chap., 38th verse.)

Previous to crucifixion the sufferer was scourged. He was also forced to carry his own cross; and this (amongst the Romans at least) probably arose from the disgust and horror with which this instrument of punishment was viewed and considered by that people, and their disinclination even to touch it. (*Cicero in Verrem*.) The criminal was accordingly condemned to bear his own instrument of torture. Previous to the infliction of the punishment, the sufferer was stripped naked, and it is probable that he was laid down on the cross for the purpose of having the nails driven in his hands and feet, or being fastened with ropes, which was sometimes the case. The cross was then elevated. Afterwards the legs were broken, wounds inflicted with a spear, or other sharp instrument, to hasten death, but this was not invariably done. As death, in many cases, did not ensue for a length of time, guards were placed to prevent the relatives or friends of the crucified

from giving them any relief, or taking them away whilst alive, or removing their bodies after they were dead.

The representations of crucifixions by painters are, in our opinion, calculated to give very erroneous notions both of the cross itself and the mode of punishment. It is not probable that the crosses actually used were so lofty or so large and massive as those which we see in pictures. Instruments of such dimensions would be perfectly unnecessary for the purpose. When we read in Josephus of hundreds of Jews being crucified by Vespasian and Titus in a day, we cannot suppose that so great a quantity of timber would be used on those occasions. The circumstance of the sufferer carrying his own cross weighs against the probability of its being of the size which these representations give it. It is not unusual in paintings to represent crucifixion as taking place after the cross is elevated, and the executioner is represented standing on a high ladder, and driving a nail into the hand of the crucified person. It seems much more likely that the sufferer was nailed to the cross before it was raised and fixed in the ground. 'Pone crucem, servo,' 'Put the cross to the slave,' is the expression used by Juvenal. Crucifixion sometimes took place with the head downwards, and St. Peter is said to have suffered death in this way. Death by the cross, in a strong and healthy person, must necessarily have been tedious and lingering, and instances have occurred of persons who, after remaining some time on the cross, were taken down, and survived. When the crucified person was only attached to the cross by ropes, this seems by no means extraordinary; and even when it took place by nailing, neither the wounds themselves nor the quantity of blood lost would be sufficient in all cases to bring on speedy death. During the reign of Louis XV. several women (religious enthusiasts, called *Convulsionnaires*) voluntarily underwent crucifixion. Dr. Merand, an eye-witness at some of the meetings of these persons, relates that he was present at the crucifixion of two females, named Sister Rachel and Sister Felicité. They were laid down, fixed by nails five inches long driven firmly through both hands and feet into the wood of which the crosses were made. The crosses were then raised to a vertical position. In this manner they remained nailed, while other ceremonies of these fanatics proceeded. Sister Rachel, who had been first crucified, was then taken down: she lost very little blood. Sister Felicité was afterwards taken from her cross. Three small basins, called palettes, full of blood, flowed from her hands and feet. Their wounds were then dressed, and the meeting was terminated. Sister Felicité declared that it was the twenty-first time she had undergone crucifixion. (Justus Lipsius, *Roma Illustrata*.)

CROSS-BOW. [ARCHERY.]

CROSSARCHUS. [VIVERRIDÆ.]

CROSSBILL. [FRINGILLIDÆ.]

CROTALOPHORUS. [RATTLESNAKE.]

CROTALUM (*κρόταλον*), an ancient musical instrument, which, it appears from medals, was used by the Corybantes, or priests of Cybele. The Crotalum differed from the sistrum, though the names are often confounded, and is by some supposed to have been of the castanet kind (*Dict. de Trevoux*). Some consider it as a cymbal of small dimensions; and from the allusions to it by Virgil, Lucretius, and others, we are inclined to be of the latter opinion.

CROTALUS. [RATTLESNAKE.]

CROTCHET, in music, a character or note formed of a round head, and a stem descending from the left side of the upper part—

It is the fourth part of a semibreve, and in slow time (*largo*, for instance,) its duration is about one second.

CROTON (*Κρότων*), now Cotrone, a town on the east coast of Calabria, with a castle and a small port. [CALABRIA.] The district of Cotrone, one of the four into which the province of Calabria Ultra 2 is divided, contained, at the census of 1824, 37,175 inhabitants, chiefly employed in agriculture. Croton was one of the oldest and most flourishing Greek colonies in Magna Græcia: its circuit was twelve Roman miles. It was famed for the salubrity of its climate, the fertility of its territory, and the beauty of its women. It was engaged in wars with its neighbours of Sybaris and the Locri; it defeated the former (Herod. v. 44), and was de-

feated by the latter in a great battle on the banks of the river Sagra. It was afterwards taken by surprise by Dionysius of Syracuse, and subsequently devastated by Pyrrhus. During the second Punic war it was besieged by a combined force of Carthaginians and Bruttians, and the inhabitants, who were reduced to 20,000, were unable to defend the large extent of their walls. They surrendered, and afterwards sought a refuge among their ancient enemies the Locri (Livy, xxiii. 30). The Romans afterwards sent a colony to Croton. This town was the birthplace of Milo the athlete, of whose strength wonderful stories are told, of several celebrated physicians and philosophers, and was also the residence of Pythagoras.

"Coin of Croton."

British Museum. Actual Size. Silver. Weight 112 grains.

CROTON, an euphorbiaceous genus comprehending a large number of species, many of which have important medical properties. It is distinguished from other genera of its order by monœcious flowers; the males with a 5-parted valvular calyx; 5 petals, 5 glands alternate with the petals; and a definite number of distinct stamens; the females with a 5-parted calyx; no petals; three bifid or multifid styles; 5 glands surrounding the ovary, and a tri-cocous fruit. The species are extremely diversified in appearance, some being trees, others bushes, others herbaceous plants; many with serrated or lobed leaves, many with entire ones; sometimes covered with hair, sometimes naked; and now with a small compact, now with long lax inflorescence. The following are a few of the more remarkable species:—

1. *Croton Cascarilla*. Leaves lanceolate, acute, quite entire, stalked, downy on the under surface. Stem arborescent. A native of the Bahamas, St. Domingo, and Florida. Fée considers it quite certain that this species is what furnishes the cascarilla bark of commerce; but others ascribe it to *Croton Eleutheria*; and Schiede suspects that it may be rather the produce of *C. Pseudo-china*, which he found to be the real Quina blanca of the apothecaries of Jalapa.

2. *Croton Tiglium*. Leaves ovate, smooth, acuminate, serrated. Stem arborescent. Flowers in terminal spikes. Fruit smooth, the size of a hazel nut. An inhabitant of the Moluccas, Ceylon, and other parts of the East Indies. This plant is at once the most active and dangerous of drastic purgatives; every part, wood, leaves, and fruit, seems to participate equally in the energy. The leaves are so acrid as to inflame the mouth, lips, and fauces of those who merely chew them, bringing on swelling and producing a sensation of burning as far as the anus. The seeds thrown into water intoxicate fish. Ten or twenty fruits bruised with honey have been known to kill a horse by the violent diarrhœa they have produced. Hence the oil obtained from the seeds, when used medicinally, has to be administered with extreme care.

3. *Croton lacciferum*. Leaves ovate, downy, serrulated, stalked; calyxes downy; flowers in terminal spikes; fruits small and velvety. A native of the East Indies. This species is said to furnish the finest of all the sorts of lac, but scarcely ever to find its way to England. It is very pure, of a bright red, and furnishes a brilliant varnish in Ceylon.

Croton Draco, a Mexican plant, with long, heart-shaped, woolly leaves; with *C. sphærocarpum* and *sanguifluum* yields, when wounded, a resinous substance of a deep red colour, resembling dragon's blood. Others are merely aromatic; from *C. balsamiferum*, the liqueur called *Eau de Mantes* is distilled; *C. aromaticum*, *niveum*, *fragrans* and *coriaceum*, have similar qualities; and *C. thuriferum* exudes a fragrant resin analogous to incense.

[Croton Tiglium.]

Medicinal Properties.—Cascarilla bark is yielded by the *Croton Cascarilla* (Don), a tree or shrub, growing in the vicinity of Jalapa, and in the district of Plan del Rio, in the province of Vera Cruz, Mexico, where it is known by the name of Copalche, or Quina Blanca. It most likely comes to Europe through the Bahama islands, from one of which the appellation *Eleutheria* is derived; but it is not yielded by any plant indigenous to these islands. (D. Don, in Jamieson's *Journal*, vol. xvi. p. 367.)

The bark occurs in pieces about a foot long, which are tubular, or overlapping; externally covered with a cuticle, which easily peels off, so that the liber or bark is often exposed, in which case it feels soft and cork-like. The colour externally is yellowish, ash-grey, or varying to reddish-brown; this last colour is mostly owing to the presence of lichens. The surface is also marked by irregular, deep, longitudinal furrows. The inner surface is a dirty or rusty brown colour. Odour faintly aromatic: taste bitter, not unpleasant, and stimulating. No alkaloid has been detected in it, but it possesses much volatile oil; one pound of bark yields one drachm and a half of volatile oil. This bark is sometimes mixed with the cinchona barks, being called gray-fever bark; a substitution in no respect hurtful.

The action of cascarilla on the human system depends partly on its bitter principle, and partly on its volatile oil; by the former it approaches the pure bitters, by the latter the aromatic stimulants. It possesses this great advantage over almost all other tonic medicines, that it is more easily digested by the stomach, when no other affection of that organ exists than debility and inactivity. This property can only be imparted to other tonics by the addition of aromatics, while it is possessed naturally by this spontaneous combination. In the treatment of pure indigestion from weakness of the stomach and alimentary canal, cascarilla merits the preference. It is likewise of much utility in the treatment of intermittent and nervous fevers, and chronic diarrhoea dependent upon debility; provided no inflammatory condition of the mucous membranes of the stomach or intestines co-exists.

Powder or infusion is the best mode of administration; decoction is objectionable from dissipating the volatile oil.

CROTON OIL. The seeds of the *Croton Tiglii* were

formerly used as a drastic purgative medicine, under the name of grains of Tilly, or Molucca grains; but at present the oil only is employed. The seeds are roasted and then subjected to compression; the oil is therefore termed an expressed oil. It is of a honey-yellow or brownish colour, of moderate consistence, having an odour resembling the resin of jalap; the taste is at first slightly rancid, afterwards acrid, causing a feeling of burning in the throat, which lasts for several hours.

A portion of the oil is taken up by alcohol, and more by æther; it is however soluble in every proportion in fixed and volatile oils. It is supposed to contain a peculiar principle termed Tiglin, in the proportion, when the oil is genuine, of 45 per cent. It is often adulterated with olive or castor oil, which admixtures may be detected by the process suggested by Dr. Nimmo. An artificially prepared substitute, sometimes met with, is a mixture of the resin of jalap, Canada balsam, fixed oil, euphorbium, &c. (Horst.) The oil of the seeds of *Jatropha Curcas* (Linn.) is also sometimes mixed with the genuine oil. In the dose of one drop (when the pure oil is used) it produces considerable purgative effect, and may be very advantageously employed when difficulty of swallowing exists, since its application to the tongue is often sufficient to ensure the purgative action. Hence in cases of apoplexy, or paralysis of the throat, the desired effect may be obtained even when the patient is insensible. In the treatment of that form of inflammation of the brain termed hydrocephalus, even when effusion appears to have taken place, and torpor or paralysis exists, croton oil will often bring about the recovery of the sufferer. (See Abercrombie on *Diseases of the Brain*, 1st edit. p. 157.) In cases of impending apoplexy croton oil is of incalculable value. It is likewise used, but sometimes very improperly, in cases of obstruction of the intestinal canal. It is however useful in aiding in the expulsion of the tape-worm, when proper anthelmintic medicines have been prescribed. The powerful impression which it makes on the intestinal canal renders it useful in some cases of dropsy. It is in most instances proper to combine it with castor oil, almond emulsion, or an alkali, to lessen its acrimony.

CROTO'PHAGA, Linn.; *Crotophagus*, Browne, Brisson; a genus of birds placed by Lesson under the third family *Hétéroramphes*, of the order *Grimpeurs* (scansores*), Cuvier; *Zygodactyli*, Temm.; *Sylvains Zygodactyles*, Vieill.

Bill snort, very much compressed, arched, without dentilations, elevated, and surmounted by a vertical and trenchant crest; nostrils basilar, open; fourth and fifth quills longest; tail feathers long, rounded.

These birds are called *Ani* and *Anno* in Guiana and Brazil, and *Anno* in Paraguay. In Mexico they are named, according to Hernandez, *Cacalotototl*, and in the Antilles *Bouts de petun*, *Amangoua*, *Diablos de Savannes*, and *Perroquets noirs*. In Cayenne their common name is *Bouilleur de Canari*. Their general colour is black, with more or less of metallic reflections.

Geographical Distribution.—A considerable portion of America; principally the hot and humid parts, but the south more especially; and the Antilles.

Habits, Food, &c.—The anis live in flocks, and are so far from timid, that when they see their companions fall before the gun, the survivors fly but a short way, and then again pitch. Bushes, the skirts of woods, and the borders of flooded savannahs are their favourite haunts. Their food consists of small lizards, insects, and seeds. Many pairs are said to use the same nest, built on the branches of trees, and of large dimensions, when considered in relation to the number of couples occupying it, where they lay and hatch their young in concert.

Example, *Crotophaga Ani*. Black, with bronzed tints in some lights. Size rather larger than that of the common blackbird: less than that of a jackdaw. Locality, moist savannahs and the neighbourhood of water, in the West India Islands, Carolina, Brazil, Paraguay, &c. It is the *Razor-billed blackbird of Jamaica* of Catesby, the *Savannah blackbird* of the English colonists, and the *great blackbird* of Sloane.

Browne (*Hist. of Jamaica*) thus describes it. 'This bird is about the size of a Barbary dove, or something larger, black all over, and splay-footed, like a parrot. It has a long square tail, a broad compressed bill, and a short thin tongue; but the beak, or upper part of the bill, is flattened

* Birds which have the external toe directed backwards.

on the sides, arched and sharp above, and straight at the edges below. They live chiefly upon ticks and other small vermin, and may frequently be seen jumping about all the cows and oxen in the fields; nay, they are often observed to fly on their backs, unless they lie down for them, which, if much troubled with ticks, they generally do when they see the birds about them; but if the beast be heedless, they hop once or twice round it, looking it very earnestly in the face every time they pass, as if they seemed to know that it was only requisite to be seen, to be indulged. They are very noisy birds, and one of the most common sorts in all the pastures of Jamaica. Their flight is low and short.

Sloane thus describes his specimen, under the name of *the great blackbird*. 'This was thirteen inches long from the end of the bill to the end of the tail, and about fifteen inches from the end of one wing to the end of the other, both being extended; the bill was three-quarters of an inch long, and black, the under mandible being straight, the upper of a singular make, distinguishing it from other birds; for it was arched or round, raised high, flat and thin on the upper round edge. The feet have three toes before and one behind (though Marcgrave says otherwise). The legs are two inches long, and black as jet; the middle toe before is one inch and a half long, armed with a pretty sharp claw, and the other toes proportionable. The colour of the feathers all over is black. The stomach of this bird was pretty thick; it was very full of grasshoppers, beetles, &c., disjointed and partly dissolved.

'It haunts the woods on the edges of the savannahs, and is very common, making a loud noise upon the sight of mankind, which alarms all the fowl in their neighbourhood, so that they are very prejudicial to fowlers; but, on the other hand, when negroes run from their masters and are pursued by them in the woods to be brought back to their service, these birds, on sight of them, as of other men, will make a noise and direct the pursuers which way they must take to follow their blacks, who otherwise might live always in the remoter inland woods in pleasure and idleness.'

'Perhaps this bird may have the toes sometimes two before, at other times two behind.'

Sloane's doubt may have arisen from a casual examination of dead specimens. The fact is, that the external toe in some scansorial birds can be directed backwards, but not forwards to any extent.

These birds are easily tamed, and may be taught to speak. Their flesh is said to have a bad odour.

[Crotophaga Ani.]

CROUP, a specific inflammation of the air tubes, giving rise to a peculiar secretion, which concretes almost immediately it is formed, producing a false membrane, which lines the affected parts. It has been shown [CATARRH] that

the mucous membrane which lines the air passages is subject to two different kinds of inflammation, each presenting distinctive characters. In one the inflammation produces a secretion which does not concrete, constituting all the varieties of bronchitis, catarrh, &c. In the other the inflammation produces a secretion which consolidates almost the moment it is formed, giving rise to the various phenomena which constitute the peculiar disease denominated Croup.

That the inflammation which terminates in the formation of the secretion peculiar to croup is of a specific nature, is argued, first, because it uniformly terminates in the production of this peculiar secretion; and, secondly, because this secretion is obviously not dependent on the intensity of the inflammatory action, since the phenomena characteristic of inflammation are often less acute in croup than in catarrh. It has been conjectured that catarrh depends upon inflammation of the secreting follicles of the mucous membrane, and that croup depends upon inflammation of the capillary arteries of its tissue, a conjecture which is probably correct, though in the present state of our knowledge it must be regarded merely as a conjecture. As the inflammation, however, presents in the essential phenomena characters so different, it is convenient to distinguish the one from the other by distinct names, and accordingly the former is termed Catarrhal, and the latter Plastic Inflammation.

The false membrane, the result of plastic or croupal inflammation, moulds itself to the part inflamed; it does not extend beyond the inflamed portion of the mucous membrane; it varies in thickness from half a line to a line; it is of a white or whity-brown colour; it has the consistence of boiled white of egg, and its firmness is always greatest where it is thickest. When it is raised from the mucous membrane, the latter is always found to be reddened and swollen, but rarely to the degree common in catarrh.

This morbid secretion is most commonly poured out on that portion of the windpipe which constitutes the larynx; hence in general the larynx forms the peculiar and proper seat of croup; but the site of this adventitious membrane is by no means confined to the larynx; it often extends above to the glottis and epiglottis, and below to the bronchial tubes. When, as happens in the great majority of cases, the adventitious membrane is confined to the larynx and epiglottis, it presents the characters just described; but when it extends into the bronchial tubes it becomes modified in its appearance. It is then generally 'formed into a single cylinder, but occasionally into a series of tubes inclosed within each other in the closest contact, and forming altogether a solid body, of a thick and tolerably firm structure, and in the exact form of the tube from whence it has been abstracted. Upon making a transverse section of this polypiform substance, concentric laminae are very apparent. It adheres but slightly to the mucous surface, and may easily after death be drawn out entire, presenting a complete mould of a large bronchial tube, with all its subdivisions, down to its minutest ramifications.'

Though in the croup the deposition of the adventitious membrane is commonly confined to the larynx, yet other parts of the mucous membrane in the immediate neighbourhood of the larynx are sometimes the seat of plastic inflammation, terminating in the formation of a precisely analogous morbid secretion. Occasionally 'small yellowish-grey spots appear upon the fauces, surrounded by the mucous membrane, highly and darkly reddened. These spots enlarge, coalesce, and form a continuous false membrane, of the colour and consistence of the buffy coat of the blood, lining the throat more or less completely. Sometimes it is seen to cover the posterior half of the tongue, so that its anterior part might be elevated by a probe in a membranous form; occasionally, though not often, it passes down the oesophagus even into the stomach, but much more frequently it extends into the lung, producing all the symptoms of croup. When plastic inflammation is seated in the fauces, it gives rise to a disease called Cynanche Maligna, or Gangrenous Sore Throat, so named from the supposition that the spots on the fauces consist of gangrenous sloughs: but more careful observation has demonstrated that they consist of an adventitious membrane. Nevertheless, gangrene does occasionally, though not very rarely, co-exist with the deposition of a fictitious membrane, that is, the false membrane is deposited over a gangrenous surface.'

It is remarkable that in general the seat of plastic in

inflammation is strictly limited to the larynx, trachea, and bronchi in children; and to the fauces in adults: hence children are by far the most subject to croup, while those of more advanced age are seldom or never attacked with croup as a primary disease, but with cynanche maligna, or gangrenous sore throat.

The most striking and characteristic symptoms of croup of course depend on the consequences that result from the obstruction to the free passage of the air to the lungs, that is, impeded respiration and change of the voice. The respiration is impeded in proportion to the quantity of adventitious membrane that is formed, and the consequent degree in which the calibre of the air-tube is diminished; in proportion to which must of course be the diminution in the column of air admitted to the lung. The air-passage in the progress of the disease is often obstructed to such a degree as to produce a most painful feeling of suffocation, attended with all the signs that denote the imminent danger of suffocation, and death is constantly occasioned by the narrowing of the air-tube to such an extent as actually to produce suffocation. In milder cases, when not impeded to this extreme degree, the respiration is still always difficult, anxious, and distressing. The edges of the circumference of the inferior extremity of the adventitious deposit being loose, mucous, and soft, frequently adhere to each other, so as to close up the tube, and require a strong effort of inspiration to overcome the temporary obstruction. 'I have seen,' says Dr. Davies, 'a slight film of pseudo-membrane traversing the upper part of the larynx suffocate an infant almost instantly. The dyspnoea becomes always great when the concretion separates, and if it be not quickly expectorated, often destroys the patient immediately.'

Owing to the diseased condition of the air-tubes the acts of respiration and of coughing produce peculiar sounds. The inspiration is sonorous and ringing, as if the sound were formed and resounded in a brazen tube. Sometimes it is dry and hissing, resembling the sound produced by a piston forced through a dry pump, or by a crowing noise similar to that emitted by a chicken in the pip. The croupal cough is a peculiar, loud, clangous, ringing sound, which has caused it to be almost universally compared to the crowing of a cock. The voice partakes of the same character, being shrill and hoarse.

The fever excited in the system by this local inflammation is commonly acute and intense. The skin is burning hot; the face flushed, sometimes covered with perspiration; the eyes prominent, injected, or watery; the carotid arteries throb powerfully; the jugular veins are tumid, and the pulse at the wrist is frequent, hard, and wiry. Sometimes, on the contrary, the febrile symptoms are of a low or asthenic character; the skin cool, and of a dirty pallid colour; the pulse frequent, but exceedingly feeble; the breath foetid, and the general prostration extreme.

As the disease advances, the restlessness and anxiety of the patient increase; the hand is constantly applied to the throat, which is often slightly tumified externally, and sometimes painful to the touch; the respiration becomes more and more difficult, the cough convulsive and exhausting, the countenance bloated, and the cheeks and lips either livid or exceedingly pale. In this stage the pulse becomes small, weak, and irregular, the eyes sunk, the skin cold and clammy, the voice lost, or capable only of a whisper; the head is constantly tossed back; the throat often seized as if to remove an obstacle to respiration; violent efforts are made to expand the lungs, and death at length puts an end to a state of intense suffering, either by convulsive suffocation, or by the subsidence of the restlessness and violence into a state of profound lethargy and stupor.

Croup, as has been stated, is almost peculiar to infants. It may occur at any period from the second month after birth to puberty; and the younger the child is, after it is weaned, the more liable it is to the disease. It is most apt to occur in the sanguineous temperament and the full habit. It often seizes a child not perfectly recovered from a previous illness, and is liable to a recurrence at distant intervals on exposure to causes which ordinarily produce only common catarrh. Yet it occasionally occurs in the adult, generally as a consequence of its extension from the fauces to the larynx. It is chiefly prevalent in the neighbourhood of large bodies of water, running or stagnant, salt or fresh, and especially among the ragged and half-starved children of the poor, who live on the sea-coast, or near the banks of rivers or canals. But it also occasionally prevails in other

situations as an epidemic, especially during the continuance of north or easterly winds, after heavy and long-continued falls of rain.

There is perhaps no disease to which the human body is subject the progress of which is so frightfully rapid. In a few hours after the attack, the morbid secretion is often formed to such an extent, as to prove inevitably mortal; yet the inflammation of which it is the result might have been checked by immediate, vigorous, and judicious treatment. It is therefore of the last importance that those who have the care of infants and young children should be familiar with the first signs of the approach of this dreadful malady. Of these a graphic description has been given by Dr. Cheyne who had abundant experience of the disease in situations in which it is but too prevalent. After having pointed out the importance of attending to the first appearance of hoarseness, which in very young children does not usually attend common catarrh, and consequently, when observed in a child living in a district which generates croup, this symptom is always much more deserving of attention, especially if accompanied with a rough cough, than it would be after puberty, this excellent physician says,—

'In the approach of an attack of croup, which almost always takes place in the evening probably of a day during which the child has been exposed to the weather, and often after catarrhal symptoms have existed for several days, he may be observed to be excited; in variable spirits; more ready than usual to laugh or to cry; a little flushed, occasionally coughing; the sound of the cough being rough, like that which attends the catarrhal stage of the measles. More generally however the patient has been for some time in bed and asleep before the nature of the disease with which he is threatened is apparent; then, perhaps without awaking, he gives a very unusual cough, well known to any one who has witnessed an attack of the croup; it rings as if the child had coughed through a brazen trumpet; it is truly a *tussis clangosa*; it penetrates the walls and floor of the apartment, and startles the experienced mother—"Oh, I am afraid our child is taking the croup!" She runs to the nursery, finds her child sleeping softly, and hopes she may be mistaken. But remaining to tend him, before long the ringing cough, a single cough, is repeated again and again: the patient is roused, and then a new symptom is remarked; the sound of his voice is changed; puling, and as if the throat were swelled, it corresponds with the cough: the cough is succeeded by a sonorous inspiration, not unlike the kink in pertussis—a crowing noise, not so shrill, but similar to the sound emitted by a chicken in the pip (which in some parts of Scotland is called the roup, hence probably the word croup); the breathing, hitherto inaudible and natural, now becomes audible, and a little slower than common, as if the breath were forced through a narrow tube; and this is more remarkable as the disease advances. A blush of inflammation may sometimes be detected on the fauces, and in some rare instances a slight degree of swelling round the larynx, and the child complains of uneasiness in his throat, and says he is choking. The ringing cough, followed by crowing inspiration, the breathing as if the air were drawn into the lungs by a piston, the flushed face, the tearful and blood-shot eye; quick, hard, and incompressible pulse; hot dry skin; thirst; and high-coloured urine—form a combination of symptoms which indicate the complete establishment of the disease. Sometimes the symptoms enumerated subside about midnight, even in the absence of medical treatment; perhaps to return in the course of the following evening. From seven or eight o'clock till midnight this complaint is always at its height; but in general, unless the patient be treated with promptitude and judgment, the disease may be expected to terminate fatally; a new order of symptoms, the second stage of croup, as it is called, taking place in the course of the next day.'

If the diet of the child be changed from its ordinary food to that of the simplest and blandest kind, as gruel or arrow-root, the moment the hoarse cough and rough voice are perceived; if it be immediately placed and kept in bed in an equable and moderately warm temperature, and one grain or two grains of the powder of ipecacuanha be given every hour, or every alternate hour, all the symptoms may subside without any further remedies, and the threatened attack be effectually prevented; but if with this hoarse cough and rough voice the child be allowed its ordinary diet, and be exposed as usual to the open air, the attack will hasten on in the mode described until the disease is fully

established; and then any treatment that may be employed, to be of the least avail, must be most energetic. The prompt employment of the most powerful remedies is indispensable; yet they must be administered with cautious and judicious boldness. It is a disease in which the inflammation, which it is the great object of medical treatment to subdue, is not so much of a violent as of a peculiar character, and this renders it necessary that the practitioner should be guarded in the administration of some of the more powerful remedies to which he must resort, and especially in the employment of blood-letting. When the fever is intense, the skin hot, the pulse full and hard, and the patient plethoric, bleeding must, indeed, be employed, and carried as far as the strength will admit; but experience has amply shown that in this disease the strength will not admit of its being carried as far as is safe and even necessary in diseases purely inflammatory. Bleeding, either by the lancet or by leeches, which latter should never be applied to the throat itself, but to its immediate neighbourhood, is a most powerful auxiliary; but it is not *the* remedy to be relied on. That is mercury, which should be given instantly and efficiently, that is, in doses of from one to three grains of calomel every hour, or every two hours, until the mouth be affected, the breath fetid, or the patient relieved. If the calomel irritate the bowels, the *hydrargyrum cum creta* may be substituted, or a free inunction of the mercurial ointment, which latter may be conjoined with the calomel, or the mercury and chalk powder. Many practitioners prefer the full employment of tartar emetic to the mercurial plan of treatment. All agree that blisters are useful auxiliaries, applied at the bottom of the sternum, or between the shoulders, but never at the throat. The vomiting produced by the tartar emetic sometimes powerfully promotes the expulsion of the adventitious membrane. There are other remedies of minor importance, the judicious employment of which may assist in putting a stop to the progress of this most formidable malady. The use or abuse of these cannot be discussed here; but what has been stated may excite the attention of the mother, and guide her to the choice of efficient remedies in the first hour or two of the attack, during which it may not be always possible to obtain medical aid. (Dr. Cheyne on Croup; Dr. T. Davies on the Diseases of the Lungs and Heart, in loco. Gælis Tract. de Rite Cognoscenda et Sananda Angina Membranacea; Copland, Dict. of Pract. Med.; and Cyclop. Pract. Med. in loc.)

CROWFOOT, the vulgar name of the different species of *Ranunculus*.

CROWLAND. [LINCOLNSHIRE.]

CROWN, the ornament of the head which denotes imperial or royal dignity, from the Latin *corona*. The radiated appears to be the earliest form of the royal crown with which we are acquainted. It appears upon the heads of the figures which are represented upon the Persian darics: radiated crowns also occur on the coins of Antiochus IV. of Syria, and of his successors; on many of those of the Greek cities; and on those of Augustus and other emperors down to the very destruction of the Roman empire. The strophium, bandelet, or fillet, and the laurel wreath, were also used as crowns in very remote times: the strophium was the most universal of all. In Constantine's time the fillet of pearls came into use; which the latter Byzantine emperors turned into a kind of coronet. Focas, as he is called upon his coins (not Phocas), has a plain low crown. Later emperors varied its form according to their fancy. Manuel Palæologus, who was crowned in 1363, is represented wearing a close crown studded with pearls. (See Du Cange, *Hist. Byzant.*, p. 242.) The trefoil upon the crown is thought to be of Gothic introduction. We find it on the crowns of Clovis and his sons, which has induced antiquaries to call it the fleur-de-lis (Montfaucon, *Monum. de la Mon. Fr.*, p. xxviii. Diss. prelim.), but the truth is, these trefoils were used on Constantinopolitan crowns before the time of the Franks (Ibid., p. xxxii.), and afterwards on those of German princes no way allied to Charlemagne. (See Montf. i., xxxiii.) Aubrey, the antiquary, was of opinion that the fleur-de-lis is really a spear-head adorned; no flower of that kind having the middle part solid.

Crowns were placed on the statues and images of the heathen gods, as well as worn by the priests in sacrificing. Some antiquaries have even thought that the crown was originally rather a religious than a civil ornament; and

that it only became common to kings, inasmuch as the antient kings were priests as well as princes.

In regard to the crown as used in our own country, a fillet diadem of pearls appears on several of the Saxon *Sceattæ*; upon one or two others a radiated diadem occurs. (See Ruding's *Annals of the Coinage of Britain*, pl. 6, 7.) Similar diadems or fillets adorn the heads of many of the Hephtharchic kings, and continue as the most common crown upon our coins through the whole of the Saxon series. The circle surmounted by three small projections first occurs upon the coins of Athelstan; on some of Edred's coins the projections end in pearls. A radiated cap appears first on a coin of Ethelred II., and the trefoil ornament upon the crown upon a few of the coins of Canute. Several varieties of arched cap and crown appear upon the coins of Edward the Confessor. (See Ruding's plates, 15—23.) The close or arched crown, which appears on some of Edward the Confessor's coins, is used on all the types of Harold, and was adopted by the earlier Norman kings. On Edward the Confessor's and the Conqueror's coins, we see labels appended at each ear; these, as we learn from an anecdote related by William of Malmsbury, in wearing the actual crown, were fastened by a clasp or button beneath the chin. On the coins of Stephen and Henry II., the open crown with fleurs-de-lis appears. Henry III. wears on his seals a crown fleury, pointed or rayed, the points raised, but not high, between the flowers; in his second seal the points are wanting, as on that on his tomb; but in Mathew Paris we read he was first crowned with a circle of gold. Edward I. has a similar crown on his coins and seals to that of Henry III. as well as his queen upon her tomb; so have his successors Edw. III., Rich. II., Henry IV. and V. Evelyn (*Numism.*, p. 34) says the monarchs of England were the first who pretended to the arched crown; that is, as it appears in modern times. Selden (*Titles of Honour*, edit. 1762, b. i. chap. 8) says he had read that Henry V. was the first of them who had a crown of the kind. In a window of Ockholt-house in Berkshire, built by John Norreys, Esq., in 1465, there certainly remained, till within a very few years, the arms of Henry VI. and his queen Margaret of Anjou, in separate coats, both surmounted by the arched barred crown; from Henry VII. downward, this arched crown, with the globe and cross, has been continued.

In France Louis XII. wore a single bar arched over his crown, about 1500; before, only a cap, till he married Henry VIII.'s sister. (See his coins.) Till Francis I. an open flowery border, somewhat like our ducal coronet, was generally used. In Spain, Philip II., after he married Queen Mary, used a barred crown. In Germany, Maximilian, grandfather of Charles V., first wore an arch over a ducal coronet. In Denmark, Christian III., after he came into England, used the barred crown. James IV., on his marriage with Margaret, daughter of Henry VII., introduced it into Scotland. John Duke of Braganza was the first who used it in Portugal. (See Gough's *Sepulchr. Monuments*, i., cxxx. cxxxi.; ii. ccviii.)

Among the Romans there were various kinds of crowns distributed as rewards for military and other achievements. The principal were the Civic, the Mural, the Naval or Rostal crown, the Obsidional, and the Triumphal.

CROWN OF THE SUN, *Ecu d'Or au Soleil*, was a French coin, first struck by Louis XI. of France, in 1475. (Le Blanc, *Traité Historique des Monnoyes de France*, 4to., Par. 1690, p. 305.) The reader is, no doubt, aware, that from an early period the circulation of foreign money, of various countries, was not only adopted but even legalized in England. By proclamation, 25 May, 14 Henry VIII., *Crowns of the Sun*, ducats, and crowns of gold not of the sun, were ordered to be received in currency, the crowns of the sun not clipped to go at four shillings and fourpence sterling. Under Edw. VI., in August, 1549, they were ordered by proclamation to pass for seven shillings; and again reduced to pass for six shillings and fourpence, by another proclamation, dated in the same year on Dec. 1. They were kept at the same rate of currency, six shillings and fourpence, by proclamations from Queen Mary I. in 1553 and 1554.

CROWS. [CORVIDÆ.]

CROYDON, a market-town in the hundred of Wallington, county of Surrey; nine and a half miles south of London: population in 1831, 12,447. The parish is very extensive, being thirty-six miles in circumference, and containing about 10,000 acres. In the survey of 1646, it is

described as consisting of 836 acres, 'having herbage for all manner of cattle, and mastage for swine without stint.' The name, which in Domes-day Book is Croinedone (croie, chalk, and dune, hill), appears to be derived from the locality of the town on the edge of the chalk. The situation, from its contiguity to the Bansted Downs, is pleasant and very healthy. The houses form one principal street, about a mile in length; of neat appearance and tolerably well paved and lighted. Some antiquarians (Dr. Stukeley's *Itinerary*) identify Croydon with the Noviomagus of Antoninus, there being still, on Broad Green, in the neighbourhood, some traces of the Roman road from London to Arundel. At the Norman Conquest, the manor, with a royal palace, was given to Lanfranc, archbishop of Canterbury. This palace, during a long period, was a chief residence of the succeeding primates. It was built of timber, and was in 1278 in its original state. No part of the present structure is older than the fourteenth century; and large portions of it were rebuilt by archbishops Wake and Herring. Here queen Elizabeth and her court were sumptuously entertained by archbishops Parker and Whitgift. In 1780 it was sold, and became a calico manufactory, and the gardens were used for bleaching grounds. The present summer residence of the archbishop of Canterbury is three and a half miles from Croydon, at the mansion in Addington Park, which stands on the site of a hunting seat of Henry VIII. During the wars of the barons with Henry III. in 1264, the citizens of London retreated to Croydon, and were there defeated by the royal troops with great slaughter. Croydon Park, in the time of Richard II. was kept by the mayor of London, Sir Wm. Walworth, who stabbed Wat Tyler. Antiquities worthy of notice are a cluster of twenty-five tumuli and barrows on a hill towards Addington; and on Thunderfield common, a circular encampment enclosing with a double moat an area of two acres. Gold coins have been found of Domitian, Valentinian, and other Roman emperors. There are several antient charitable foundations, the principal of which are the hospital or almshouse of the Holy Trinity, built by archbishop Whitgift in 1596, and well endowed for the maintenance of thirty-four decayed housekeepers; and a school for girls, founded by archbishop Tennyson. A school for 150 children is supported by the society of friends. The East India Company's College of Cadets at Addiscombe House near Croydon, has fourteen professors and masters, and about 140 students. The parish church of St. John's is the largest and finest in the county. It is built of freestone and flint, with a lofty embattled tower surmounted with pinnacles. The interior contains several magnificent monuments of the archbishops there interred; Drs. Herring, Potter, Wake, Abbot; and especially those of Sheldon and Whitgift. The windows were formerly remarkable for much beautiful painted glass; but in Cromwell's time the Puritans completely destroyed it. Near the church is the source of the Wandle, a small stream which flows into the Thames and abounds in excellent trout. A new church has been erected by the parliamentary commission. The town hall, in which the assizes are held, and the gaol, are commodious and substantial stone buildings. There are barracks with extensive accommodation for artillery; and a theatre. The Croydon canal communicates with the grand Surrey canal at Deptford. A railroad runs from Wandsworth to Croydon, and thence to Merstham near Reigate. A new rail-road to London is about to be constructed. Croydon is the election town for the eastern division of the county. The market on Wednesday is well supplied with corn, especially oats, and the fair on October the second is noted for the sale of walnuts. An elaborate account of the town, church, and archiepiscopal palace, is given in Dr. Ducarel's history of Croydon (inserted in the *Bibliotheca Topographica Brit.* vol. ii.). See also Lysons' *Environs of London*, vol. i. p. 170, and Britton's *Beauties of England*, vol. xiv. p. 122.

CROZO'PHORA TINCTO'RIA, a small, prostrate, hoary annual, with slender cylindrical stems, about a foot long; soft, oval, alternate, almost rhomboidal leaves, which are plaited and curled at their edge; small flowers arranged in short clusters; and drooping fruit composed of three blackish rough cells. It is a native of barren places all over the south of Europe, and is cultivated about Montpellier for the sake of the deep purple dye, called Tournesole, which it produces. Its properties are acrid, emetic, corrosive, and drastic, like the most virulent Euphorbiaceus plants.

1, a male flower cut open, showing the stamens; 2, a closed flower; 3, a nearly ripe fruit; 4, 5, different kinds of starry scales, with which all the green parts are covered.

CRUCIBLE, a chemical vessel in which substances are exposed to high temperatures. Crucibles are made of various materials, forms, and sizes, and are often called *melting pots*. Earthen crucibles are used for the purpose of assaying ores, as those of lead, copper, and tin. For these purposes the refractory kind, called Hessian or Cornish crucibles are prepared; they cannot however be employed for heating saline, alkaline, or earthy matters, as these would act upon them. Sometimes they are made of commoner and more fusible clays when not required to withstand a high temperature. Crucibles are occasionally used made of porcelain, but they are extremely apt to crack.

Black-lead crucibles, formed of about three parts of finely-powdered plumbago, and one of good clay, are also much employed, especially in melting metals; they are more expensive than earthen crucibles, but are less liable to crack.

Glass-makers' crucibles are usually made of Stourbridge clay.

In fusing the alkalis, potash and soda, silver crucibles are used; but as they readily melt, they are not much employed for other purposes.

For chemical uses platinum crucibles are principally employed; they withstand a high temperature, and are not in general easily acted upon. The alkalis however, and the alkaline nitrates, and the alkaline earths, act upon them; and those metals which readily fuse, such as bismuth, lead, and tin, immediately destroy them when heated in them. Large platinum vessels are employed for the concentration of sulphuric acid; no acid acts upon them, but they are dissolved by chlorine.

CRUCI'FERÆ, a very extensive and most natural assemblage of plants, called Tetradynameæ and Cruciateæ by Linnæus, and Brassicaceæ by others. It comprehends the mustard, cress, turnip, cabbage, scurvy-grass, radish, horseradish, and similar plants, having a pungent principle diffused more or less in their sap, and giving them valuable antiscorbutic qualities. All the species have an inflorescence without bracts, a calyx of four sepals, four petals with long claws, and their blades placed something like the arms of a Maltese cross, whence their name; six sta-

mens, four of which are longer than the other two; and a fruit consisting of two cells, with a central frame, to which is fitted a pair of deciduous valves, and from the sides of which under the valves is stretched a thin double transparent diaphragm. In each cell are two or more seeds, with an embryo folded upon itself and destitute of albumen. The form of the fruit is extremely variable; when it is long and slender, it is called a Silique; and when short and round, a Silicle: hence the two divisions of the Tetradynameæ of Linnæus into *Siliquosæ* and *Siliculosæ*.

About a couple of thousand species are dispersed over the milder parts of the world, refusing alike to exist beneath the severe cold of the arctic zone and the excessive heats of the tropics. A large proportion consists of inconspicuous and useless weeds: many are objects of beauty, from the size and gay colours of their petals; and the names already mentioned show that another part of the order consists of plants useful to man.

[Cheiranthus Cheiri.]

1, a flower from which the petals have been removed; 2, the stamens; 3, a section of the ovary; 4, a ripe fruit, from which the valves are separating; 5, an embryo.

Owing to the number of the species, and the great resemblance between them, the systematic arrangement of Cruciferous plants was until late years exceedingly unsatisfactory. It has however been discovered, that the embryo presents the most constant character, and that by five modifications of the manner in which it is folded up, five precisely limited divisions of the order are secured. The following cut illustrates them. Let A 1 be an embryo with the radicle applied to the cotyledons in such a way as to lie against its edges; then B 1 will be the appearance of such

an embryo when cut across, and C 1 will be a sign expressing the mutual positions of the radicle and cotyledons by a circle and two bars; these are Pleurorhizæ. Then fig. A 2 will be same embryo with the radicle applied to the back of the cotyledons; and B 2 and C 2 will give the section and sign of what are called Notorhizæ. When the cotyledons instead of being flat are channelled so as to receive the radicle in a kind of groove, as at A 3, it gives the division Orthoplocæ. If the cotyledons are so long as to be doubled twice, A 4, they constitute Spirolobæ; and if, as at A 5, the cotyledons are doubled three times, they indicate the division Diplecolobæ. Upon these distinctions all recent arrangements of Cruciferæ have been formed.

CRUCIROSTRA. [FRINGILLIDÆ.]

CRUDEN. [CONCORDANCE.]

CRUSADES. Under this name are designated the religious wars carried on for two centuries between the Christians and Mohammedans, at a time when diplomatic negotiations were unknown, and the sword decided all matters in dispute between one nation and another. The cause was ultimately lost by the Christians, who sacrificed in the struggle the lives of several millions of their brethren, though their claim was originally a reasonable one. In the beginning the Christians demanded only a free pilgrimage to the holy sepulchre, but afterwards the contest was for the possession of Jerusalem. The Crusades however were by no means wars of conquest or of royal caprice; man fought against man for some higher yet mistaken principle. Hence their struggle offers something more honourable than the generality of wars, and deserves particular attention on account of its influence upon the civilization of Europe.

As long as the caliphs of Bagdad and after them the Fatemides of Egypt possessed Palestine the Christians were not checked in the exercise of the religious practice of visiting the holy sepulchre, which was in harmony with the opinions of that age: the Caliph Harun-al-Rashid had even the keys of the holy sepulchre forwarded to Charlemagne as a present. But when the Turks had effected the conquest of Palestine, the hospitality of the Arabs gave way to the brutality of the new possessors; the Christians were subjected to so many vexations, that the whole of Europe re-echoed with the complaints of the pilgrims; who instead of returning to their homes loaded with holy relics, brought back only wonderful tales of their insults and sufferings.

In consequence of this, Pope Sylvester II. (who died in 1003) began to preach a crusade against the Seljuk Turks for the conquest of the holy sepulchre. Sixty years afterwards, when only 2000 pilgrims had returned to Germany out of 7000—who had been sent to Palestine by their bishops—and the possession of Jerusalem had fallen into the hands of the Turkish chief Ortok, this untoward event filled Europe with consternation, and a desire to revenge the wrongs of the pilgrims. A single spark only was wanting to inflame the whole of the western empire to a contest with the sword for that privilege which Harun-al-Rashid had acknowledged.

Thirty years however elapsed before Pope Urban II. decreed the first Crusade. First at the Council of Piacenza (March, 1095), afterwards at that of Clermont in Auvergne (November, 1095), supported by the ambassador of the emperor of Constantinople and numerous powerful lords, he proclaimed the sacred war, and appointed the 15th of August (1096), the Day of Assumption, for the departure of the army. The minds of the Christian warriors had been previously excited by the preaching of Peter of Amiens (the Hermit), and by the loud complaints of the Patriarch of Jerusalem; who, provided with letters of credit from the pope, travelled through Europe, and filled all classes of society with enthusiasm for this holy warfare. Those who determined to set out for the Holy Land wore on their breast the figure of a red cross, and hence the name of Crusaders.

First Crusade. The departure of the army having been deferred for a year, Peter of Amiens, Walter Habenichts, Count Emiko of Leiningen, and the priest Gottschalk, impatient of delay, and prompted by religious fanaticism, set out with an immense multitude which is stated at 80,000 or 100,000 men, besides women and children, and a crowd of followers. This army, after having ill-treated and robbed the Jews in their own country, was reduced to one-third of its number in Hungary; the remainder was cut to pieces at Nicæa in Asia Minor.

The east was now threatened with a national migration from the west. The bulk of the army was twice as nume-

rous as that of their forerunners. It was headed by the noblest knights of those times, Godefroy of Bouillon, Duke of Lower Lorraine, Baldwin his brother, Hugo the Great, brother of the king of France; Robert, Duke of Normandy, son of William the Conqueror; Raymond of St. Gilles, Duke of Toulouse, and Bohemond, Prince of Tarentum. The general indulgence proclaimed at Clermont, the feudal system, which led the vassals to join in the sentiments of their sovereigns, combined with the religious fanaticism of the many and the interested views of the few, created this formidable army. The pope had the address to dispose the heads of the Crusaders to acknowledge him formally as the sovereign of all the lands which they intended to conquer. The results of this expedition were of great importance. After crossing the sea into Asia, the Crusaders took possession of Nicæa in Asia Minor, and Laodicea and Antiochia in Syria. Bohemond obtained the principality of Antiochia, Baldwin that of Edessa. New Christian principalities arose also in Tripolis, Sidon, Tyre, and other places. In the mean time Jerusalem was no longer in possession of the Turks. The Caliph Mostaali had taken it from the successors of Ortok (1096), and had again united it to Egypt, making a rival caliphate. [See FATEMIDES.]

The Crusaders however did not allow themselves to be stopped by this change of circumstances in their victorious march; they advanced with 60,000 men, the relics of their army, against Jerusalem, besieged the town, took it (1099—June 7, July 15), and preserved it, together with all their conquests, in the great battle of Ascalon, against the caliph of Egypt and the Seljuk chieftains. It is said that the number of slain in the conquered town amounted to 70,000. The Jews were burnt in their synagogues.

Consequences of the First Crusade. Kingdom of Jerusalem.—Godefroy of Bouillon was elected king of Jerusalem, a new state, with a considerable territory. The constitution of this new kingdom was regulated by a statute called 'Les Assises de Jerusalem.' Godefroy died one year after his accession to the throne; his brother Baldwin was his successor, who was followed by Baldwin II. (1118), Fulk (1131), Baldwin III. (1148), Almeric (1162), Baldwin IV. (1173), Baldwin V. (1186), who was followed by Guido of Lusignano, who reigned till 1187, when Saladin put an end to the Christian kingdom. These kings of Jerusalem were compelled to fight with a force of only about 12,000 regular troops against the power of two mighty enemies, the Turks and the Fatemide caliph of Egypt.

Crusaders' Religious Military Orders.—The first Crusade brought two military religious orders into existence, the Knights of Jerusalem, instituted by Baldwin I., and the Knights Templars, established by the joint efforts of Hugo de Payens, Godefroy of St. Adhemar, and seven other knights. The German Knights of the Cross are of later origin.

Second Crusade.—Though the Franks had extended their possessions from the mountains of Armenia to the very boundaries of Egypt, their strength was too feeble to prevent (under the government of Baldwin III., A.D. 1144) the Atabek of Mosul from taking Edessa. The Atabeks were governors of the dynasty of the Seljuks. One of the Atabeks, named Emad-eddin Zenghi, from Mosul, having made himself independent, transmitted the kingdom to his son, Nureddin the Great, who fixed his residence in Aleppo, and became an object of terror both to the Christians and to the Fatemides. In the mean time the kingdom of Egypt had passed into the hands of Selaheddin (Saladin the Great), an event which took place under the following circumstance:—In order to settle a contention about the succession, Nureddin sent a Kurd, named Shirkuh, into Egypt. The peace-maker usurped the government for himself, and bequeathed it to his brother Ayub's son, who after the death of the last of the Fatemides seated himself on the throne of these rival caliphs, and conquered Egypt, nominally for the Caliphate of Bagdad. This son of Ayub was called Saladin; and the dynasty of which he became the founder is in history known by the name of the Ayubides. After Nureddin's death, Saladin conquered almost all Asia Minor, in addition to Tripolis and Tunis, and destroyed the Christian kingdom of Jerusalem.

After the conquest of Edessa, Bernard of Clairvaux took upon himself the office of Peter the Hermit, and preached a second crusade, in consequence of which two of the greatest Christian chiefs, the German emperor Conrad III., and Louis VII., king of France, were induced to take the

cross (1147). For this undertaking Western Europe armed 140,000 knights and near a million of foot-soldiers, and yet in spite of their mighty superiority the expedition failed. The changes which had taken place in the East had raised up a new enemy against the Crusaders in the emperors of Constantinople, who were less afraid of the peaceful governments of the Turks in Asia Minor and Egypt, than of the depredation and ravage which the passage of a disorderly army, such as that of the Crusaders, would cause to their possessions. Hence the artifice and treachery of the emperor Manuel Comnenus prepared the way for the destruction of the Christian armies. The German emperor, misled by treacherous scouts, lost in the defiles of Taurus the bravest of his soldiers; the relics of his army were almost destroyed at the siege of the fortress of Iconium. The troops of the French were also defeated by the Sultan of Room, and annihilated before Damascus, a town which the Christians had in vain attempted to take by storm. The relics of the two armies united in one body (1149). Thus the expedition of the Crusaders in the East was a complete failure. The only successful result of this undertaking was the retaking of Lisbon from the Moors, which was effected by the Christian navy.

Situation of the East after the Second Crusade.—Baldwin III. however did not give up his plans in despair. His army was at intervals increased by small bodies of Crusaders, who came to his assistance from Europe. Nureddin the Great felt more than once the power of the Christian warriors. Yet all these advantages were frustrated by the discord of the Crusaders, fomented by the rivalry of the Templars and the Knights of Jerusalem. Baldwin was succeeded by Almeric, called also Amauri, who was followed by Baldwin IV., who died likewise soon after the battle of Ramla. After his death Guido of Lusignano was completely defeated at the battle of Tiberias; he was taken prisoner, together with the Grand Master of the Templars, and many noble knights (1187). Saladin took possession of all the important places in Palestine, together with Jerusalem and its environs, and put an end to the Christian kingdom of Jerusalem, which had existed a century. But Saladin showed himself a generous conqueror; he granted to the Christians the possession of the Sepulchre of Christ, and allowed the prisoners to return home. The patriarch Heraclius, the clergy, the knights, and many soldiers returned to their homes, or withdrew to the few towns which the Christians still possessed on the coast of Palestine.

Third Crusade.—Bishop William of Tyre brought this bad news to Rome, which it is said caused the premature death of Pope Urban IV. The youth of Europe were again summoned to appear under the banner of the cross, not to defend the right of visiting the Holy Sepulchre, for Saladin had already granted this privilege to the Christians, but the lives of the bravest knights of Europe were to be thrown away on the insane project of again conquering the kingdom of Jerusalem. Europe obeyed the summons. The German emperor, Frederick Barbarossa, Philip Augustus, king of France, and Richard Cœur de Lion, king of England, and several German princes, enlisted themselves as Crusaders. The Italians appeared in arms under the bishops of Ravenna and Pisa. The Knights Templars, and those of Jerusalem, who were scattered about Europe, collected themselves again in strong bodies, and sailed for the Holy Land. Fifty vessels left the harbours of Denmark and Friesland and thirty-seven those of Flanders for Palestine. The expenses of the war were supplied by a tithe, called Saladin's tithe, which the pope ordered all Christians, including even the clergy, to pay. The emperor, Frederick I., a man of ability and experience, had found means to compel the Emperor of Constantinople to favour the undertaking; he was also engaged in negotiations with the Sultan of Iconium, who however betrayed him. By these means, and with a force of 600,000 armed men, this expedition might have succeeded; but the Crusaders did not carry on their military operations in one body. Several troops of Italian, Greek, and German adventurers, who advanced before the great army to place themselves under Conrad of Montferrat, Lord of Tyre, and Guido of Lusignano, made an unsuccessful attempt to take Ptolemais (St. Jean d'Acre). Frederick I. met with a premature death by bathing in the waters of the river Cydnus, 1190. His son, Frederick of Swabia, who died soon after, put himself at the head of the relics of the imperial army;

but was not able to give a favourable turn to the siege of Acre. At length Philip Augustus and Richard Cœur de Lion appeared on the battle-field. Richard had already taken and sold to Guido of Lusignano the island of Cyprus. The kings joined their armies before Ptolemaïs, and their united forces at last succeeded in taking this single fortress, after three years' siege and nine battles.

In consequence of these long and sanguinary struggles, the Christian army was so reduced, that the kings, despairing of success, thought of returning to Europe. Philip Augustus left Palestine soon after the capture of Ptolemaïs. Richard Cœur de Lion followed him after a short struggle with Saladin, with whom he made truce, and left him in possession of Jerusalem (1192). In the mean time Philip Augustus had made an inroad into Richard's dominions of Normandy. The mild, benevolent, and generous Saladin the Great died 1195, in Damascus, in his fifty-seventh year. During this crusade there arose a new military order, called the German Cross Knights, whose first grand master was Henry Walpode.

Situation of the East after the Third Crusade.—Conrad of Tyre had married the sister of Baldwin II., and thus acquired a claim upon the throne of Jerusalem. Guido of Lusignano however had already assumed this title. Conrad died by the hand of assassins. His widow afterwards married Guido's brother, and the two brothers assumed the name of kings of Jerusalem. One of them, named Almeric, died likewise, and the imaginary crown of Jerusalem was the inheritance of John of Brienne, the husband of the daughter of Conrad king of Tyre (1210).

Fourth Crusade.—Isaac Angelos, the Emperor of Greece, was robbed of his throne and deprived of his eyes by his own brother (1194). His son Alexius fled to Venice to ask for assistance (1203). In the mean time the enthusiast Fulk of Neuilly and Pope Innocent III. had prepared for a new crusade, which was headed by several Italian and French noblemen, such as Thiebault of Champagne, Count Boniface of Montferrat, Count Baldwin of Flanders, and Simon of Montfort. The Doge of Venice, Arrigo Dandolo, induced the Crusaders to take the town of Zara in Dalmatia for the republic of Venice. The Crusaders, probably at the instigation of Dandolo, instead of waging war against the infidels, took an active part in the affairs of Greece, conquered Constantinople, and after having elevated to the throne or deposed several emperors, at length put the imperial crown upon the head of Baldwin of Flanders, giving him the fourth part of the empire, and dividing the rest among themselves.

This behaviour drew upon them the popish interdict, which however was of no long duration: Pope Innocent absolved them. Thus the chiefs of the Franks ruled for about fifty years over the empire of the East, around which arose three new Greek principalities, Nicæa, Trebizond, and the despotat of Ætolia. This crusade was a complete failure.

After the insignificant crusade of Andrew, king of Hungary (1217), John, king of Jerusalem, led his army against Egypt (a plan which was certainly calculated to assure the conquest of the Holy Land), and took Damietta. The sultan, Melek Kamel, fearing the consequences of a war, proposed peace and an exchange of Jerusalem for Damietta. The proud conqueror refused the offer, and proceeded without caution along the Nile towards Cairo. The sultan ordered the dikes of the Nile to be opened; the waters destroyed a large part of the Christian army, freed Damietta, and secured cessation from war for eight years, and the retreat of the relics of the Crusaders (1221).

Frederick II. of Hohenstauffen, the greatest of the German emperors, who excelled his contemporaries in wisdom, generosity, and manners, the husband of Yolanta the daughter of John of Jerusalem, had pledged himself at his coronation (1215) to a crusade. The affairs of the state, however, retarded for twelve years the fulfilment of his promises. At length, yielding to the pressing invitations of Pope Gregory IX., he sailed from Brindisi for Palestine. But after a few days' voyage, sickness compelled him to return to Otranto. This drew upon him the anger of the pontiff, who laid him under an interdict. Perhaps this was but a plausible pretext for humiliating the hated house of Hohenstauffen. Though under the pope's interdict, the emperor again appeared the next year in arms in the Holy Land, which gave the pope an opportunity of allowing his enemies to invade the emperor's Italian dominions. Even John of

Jerusalem was faithless and audacious enough to occupy by force the kingdom of Naples.

The sultan, Melek Kamel, set no great value upon the possession of Jerusalem, and was willing to exchange it for an alliance with Frederick against his enemy the Sultan of Damascus. Frederick, pressed by his Italian affairs, profited by the good intentions of the sultan, and obtained from him the possession of the capital of Palestine. After putting upon his head the crown, he marched homewards with his army, and his approach to the Vatican was enough to determine the pope to take away the interdict.

Situation of the East after the Fifth Crusade.—The Khowarzm-shah Turks, pressed by the Mongols, who soon after put an end to the Caliphate, rushed into the Holy Land, and defeated near Gaza the whole of the Christian forces (1244). Jerusalem, together with Palestine, became a possession of the sultan of Egypt, as a member of their alliance.

Sixth Crusade.—Louis IX., king of France, called St. Louis, undertook in the year 1249 a new crusade. He followed the plan adopted by John of Jerusalem, and conducted his army against Egypt.

This land however seems to have offered few advantages to the Christian conquerors. Louis, after having easily obtained possession of Damietta, marched along the Nile towards Cairo, but, chiefly through the imprudence of his brother d'Artois, he lost the battle of Mansura, and with it the bulk of his army. D'Artois, and many of the bravest knights, were slain; hunger and sickness compelled the remainder to retreat. Before they were able to reach Damietta, they saw themselves overtaken and surrounded by the sultan, who made the king prisoner, together with the relics of his army. A truce was agreed on, in which the Christians were compelled to give up Damietta, and to pay a ransom of 800,000 Byzantine guilders. The Mamluks, a guard composed of Turkoman youth, who had gradually increased in power, dissatisfied with the generosity of the sultan towards the Christians, murdered him, and placed Ibek, their commander, upon the throne of the caliphs of Egypt.

Had Louis possessed fewer personal qualifications and less courage, he would never have obtained his liberty; yet these barbarians allowed him to depart, and there are some historians who pretend that if Louis had acted with more cunning, he could even have obtained from the Mamluks the object of his undertaking.

Though Louis, upon his return to France, found his kingdom in a disordered state, on account of the misery and waste caused by the revolutionary movements of bands of a fanatic peasantry called Pastorells, he could not give up the idea of reconquering Jerusalem, and a few years after his return he prepared a new crusade. This crusade however did not extend beyond Tunis, where Louis expected to make converts of the princes. This undertaking failed likewise; and Louis found his grave on the shores of Africa (1270).

Seventh Crusade.—England was the pioneer of the seventh and last crusade. While Louis was still in Tunis, Edward, the grandchild of Richard Cœur de Lion, prepared a new crusade. After the death of Louis he appeared before Tunis, but soon left Africa for Palestine to fight against the Saracens. Not being able to accomplish his plans he returned home, and was the last among the Christian princes who dreamed of conquering the Holy Land.

Situation of the East after the last Crusade.—A few towns situated on or near the coast, Antioch, Ptolemaïs, and Tripolis, were still in possession of the Christians, and were chiefly defended by the Templars and other military orders. The dispute about the kingdom of Jerusalem still continued between the descendants of the Baldwins. At length Ptolemaïs fell (1291); the other towns were either abandoned or taken; the knights fled to Europe, and the whole of Palestine and Syria again became a possession of the sultans of Egypt, and obeyed the laws of Mohammed. In short, the labour of two centuries was lost; and we may regard this epoch as a kind of oriental restoration.

Crusades in the Western Empire.—We have already observed how Emiko of Leiningen and the priest Gottschalk had persecuted the Jews in the Rhenish provinces in their expedition towards the East. This was called a crusade against the Jews. The banner of the cross was likewise displayed in the wars against the Moors in Spain, against the heathens in Prussia and Lithuania, against the

Waldenses and Albigenses in France, against all kinds of heretics, even against the house of Hohenstauffen when placed under the popish interdict; which wars, unjust in their principle, were rendered by fanaticism still more terrible in their consequences.

Object of the Eastern Crusades.—The object of the first crusades was to obtain possession of the Holy Sepulchre for the Christians in Europe; and secondly, to protect the Christians in the East against the persecutions of the Turks. The first object might perhaps have been obtained by treaties; the second, however, could not be secured as long as the Turks possessed Palestine; and hence the conquest of this country became the principal object of the Crusaders. This conquest might have been made in favour of the lawful lords of Palestine, the caliphs, but the Franks, misled by fanaticism, preferred to take for themselves that which by right belonged to others, and by a just retribution lost the fruits of two hundred years' struggle. On the other hand, if they had been guided by moderation, they might have easily obtained from the caliph Mostaali the possession of Jerusalem by treaties.

The object of the second crusade was from the very beginning inconsiderate. The possession of Jerusalem was not in danger; nothing had happened to cause a war except the taking of Edessa.

The third crusade was undertaken with the view of reconquering the Holy Land. This war may appear just to those who think that the acquisition by the sword and the possession of a few years make a good title; or even to those who, misled by diplomatic sophistry, fancy that crowns and men may be inherited like goods and chattels. The crusade of Count Baldwin was an infamous intrigue and mystification of the Doge Arrigo Dandolo: the crusade of the king of Jerusalem was an idle attempt to change his imaginary crown into a real one by taking the towns of Egypt; neither of these expeditions deserves the name of crusade, a name that might be given with more propriety to the fourth crusade undertaken by Andrew, king of Hungary.

The hatred of the pope against the house of Hohenstauffen was the cause of the fifth crusade. In spite of the impure motives of this war, however, the emperor, by his prudent conduct, succeeded in obtaining the possession of Jerusalem without the sacrifice of time or blood.

The sixth and seventh crusades were undertaken with the object of regaining possession of Palestine, which had been lost in the battle of Gaza. The chief reason why so many powerful expeditions turned out signal failures may be sought in the rivalry of the knights of the same country, and the jealousy of their respective kings; hence there was no unity of action, no discipline, no commander-in-chief, and their numerous armies were scattered and defeated like sheep without a shepherd.

Consequences of the Crusades.—Though the crusades sacrificed the lives of several millions of Christians, among whom were many women and children, and though they were one of the causes which contributed to give the popes such an overwhelming power in Europe, although they were instrumental in bringing about the religious wars or persecutions which afflicted Europe, and also in weakening the power of the eastern princes, and rendering them unable to withstand the attacks of the Mongols, it cannot be denied that the crusades were accompanied by many beneficial effects.

Such, for instance, were the increased activity of political life in Europe, the union of different nations in a common object, the consequent dissipation of international strifes and prejudices, and a tendency to a more humane reciprocal intercourse, the acquisition of scientific knowledge, improvement in manners and habits, the breaking up of the feudal system by the sale of estates to the merchants in exchange for the money required by the nobles for their military accoutrements and provisions, the increased wealth of the mercantile towns in Italy, which led to the revival of the fine arts and the sciences in that country, and finally, the diffusion of more liberal modes of thinking in matters of government and religion, occasioned by the intercourse of the western and eastern nations. The great influence of the crusades in extending commerce has been pointed out by Heeren in his 'Essay on the Influence of the Crusades.'

Before the crusades the heavy clouds of religious fana-

ticism hung over Europe, and mankind bore quietly the chains imposed upon their minds by the authority of the priesthood. But the knight and the soldier who returned from the crusades after having a thousand times experienced the generosity and hospitality of the Musselmans, brought home the singular tale that in those remote countries there existed a race of men noble-minded and kind, though professing a creed different from that of their invaders.

Blind submission to the authority of the priesthood was exchanged for meditation and independent reflection. The inquisition, which was instituted about this time, proves that there were men who were deemed fit subjects for an inquisition, that is, heretics and philosophers. One or two centuries after the crusades, Europe was filled with religious sceptics, as far as regarded the infallibility of the church, some of whom even dared to be religious reformers, such as Huss, Wickliffe, and others. At length Luther appeared, who by his theses and his translation of the Bible shook the very pillars of the Vatican.

Since the reformation of Luther, the Christian religion has been split into numerous sects, an event which some regard as injurious to religion. But as, in the chemical process of fermentation, in order to prepare a new and better product, it is necessary that the old matter be dissolved into minute particles (that the grape for instance be pounded and reduced to an unsightly juice, in order to make a pure and costly wine), so it is perhaps necessary that Christianity should be divided into many sects in order to clean it from all accidental impurities, and to make it fit to become the universal religion of mankind.

CRUSCA, ACCADEMIA DELLA, a society of Italian philologists who compiled the great Dictionary of the Italian language, and who continue to discuss and decide upon questions concerning that language, its grammatical rules, and the choice, application, and etymology of its words. This academy, which is patronized by the Tuscan government, is generally looked upon by the Italians as the highest authority in matters of language. It was originally an offspring of the Accademia Fiorentina, several members of which, during the reign of the Grand Duke Cosmo I., with Leonardo Salviati at their head, left the parent assembly, and formed a distinct society for the object of producing specimens of pure Tuscan diction. Salviati himself set the example by publishing his 'Avvertimenti della Lingua sopra il Decamerone,' 2 vols. 4to., 1536. The great and laborious work of the new academy, which Salviati first promoted, but which was not completed till many years after his death, was the Dictionary which was published at Venice in 1612, at the expense of the academy, 'Vocabolario degli Accademici della Crusca.' It has since been enlarged and revised, and has gone through several editions, the last of which is that of Florence, 6 vols. fol., 1729—38, with another volume of Giunta, or additions, 1751. A reprint of this edition, with additions, was made by Pitteri in 5 vols. 4to., Venice, 1763, and another by Father Cesari, with more additions, in 6 vols. 4to., Verona, 1806. All the additions, however, contained in these two editions have not received the approbation of the academy. Since that time Monti has published his 'Proposta di alcune Correzioni ed Aggiunte al Vocabolario della Crusca,' 3 vols. 8vo., 1817—24. A long and very animated controversy was carried on for years between Monti, Perticari, and several of their friends in various parts of Italy, and the supporters of the authority of the Crusca academy in matters of language. In this dispute, as in all party disputes, exaggerations and paradoxes proceeded from the zealots of both parties, whilst the more sensible and discriminating men, on both sides, came much nearer to each other's conclusions than they themselves seemed aware of. There is a full though compendious exposition of the question at issue in No. X. of the *Journal of Education*, art. *On the Study of the Italian Language*, with a sequel in No. XII. of the same journal.

Academies, like la Crusca, the French academy, and the Academia Española, have no power to enforce their decrees, save that of public opinion, that is to say, the opinion of the majority of writers and readers. It is true that they may influence that majority so as to obtain a too servile obedience for a time, but the remedy is always in the power of spirited and well-informed writers, who may make really useful innovations and support them by proper arguments; and this is what has happened in Italy. There is no inquisition or temporal tribunal to prevent this. To complain therefore of the tyranny of La Crusca seems an absurdity. That society only states its collective opinion, which the learned of Italy may gainsay if they can find good reason for it. That society has rendered an essential service to the Italian language by fixing its rules and collecting its appropriate words from the best writers, a task which was perhaps beyond the power of any individual to undertake, or at least to accomplish with success. It has also published very correct editions of Dante, Boccaccio, and other Italian classics. Goldoni and others, in their personification of the academy, have represented him as a pedantic being, but many of the words and phrases which they have put into his mouth, are not such as are found in the works approved of by the academy. Ridicule is not always grounded on truth. In the earlier period of its institution, the Crusca, or at least some of its members, assumed too dogmatical a tone, which was in accordance with the taste and state of society in those times, especially in their strictures on the 'Gerusalemme Liberata.' [TASSO.] But those times are long gone by, and the academy now bears its honours with mild and becoming dignity. Several of the most learned men, not only of Tuscany but of other parts of Italy, are among its members.

The Academy della Crusca, having lost many of its most distinguished members, fell into comparative inertness and oblivion in the latter half of the last century, when, by a decree of the Grand Duke Leopold I., it was merged in the new Florentine Academy in 1783. The Magliabecchi Library was assigned for the sittings of the new society. In 1811 Napoleon restored the Crusca Academy to its separate existence, with 12 resident and 20 correspondent members. He founded also an annual prize of 500 Napoleons for the best written works in Italian prose or poetry, to be awarded by the decision of the academy. Micali's 'Storia d'Italia avanti il Dominio dei Romani' was one of the first which obtained the prize. When Tuscany returned under the sway of the Grand Duke Ferdinand, in 1814, he confirmed the institution of the academy and assured it of his patronage. The academy then began to publish its acts: 'Atti dell' Imperiale e Reale Accademia della Crusca,' of which several volumes have since appeared. The first volume, 1819, begins with a concise but interesting history of the academy from its first foundation. Its sittings take place in the palace Riccardi, formerly Medici, which was built by Cosmo the elder. Prizes are awarded by the academy every five years. The prize of 1830 was given to the historian Botta for his history of Italy during the French revolution and war.

The name Crusca means 'bran,' and the emblem of the academy is a 'frullone,' or sifting machine, with the legend: 'Il più bel fior ne coglie: ' It gathers the finest part of the flour of the language.'

CRUSIUS, CHRISTIAN AUGUST, a philosophical writer, who enjoyed a great but transient reputation in the beginning of the last century. He was born in 1712 at Leuna, in Merseburg, and died, in 1776, first professor of theology at Leipzig. His design was a reconciliation of philosophy with the orthodox theology. Considering the Wolfian philosophy the great enemy of religion, he made that the chief object of his attack. He was successful in exposing several of the dogmatical assertions of his opponents, particularly what are technically called the ontological and cosmological demonstrations of the being of a God. Unfortunately however he set up a system even more dogmatical than the one which he attempted to subvert, and he had the mortification to outlive the reputation which he had acquired.

CRUSTACEA, (Zoology), *Crustacés* of the French, *Krustenthiere* of the Germans, *Μαλακόστρακα* (Malacostraca) of Aristotle and the ancient Greeks, a class of articulated animals, whose external covering is less solid than that of the majority of testaceous mollusks, but much firmer and harder than the skin of the naked mollusks, and whose

conformation is essentially distinguishable from other classes, especially in the circulating, respiratory, and locomotive organs. *Types*, common crab [CRAB] and common lobster [ASTACUS].

SKELETON.

As in many of the testaceous mollusks, the skeleton of the crustacea is external. It is made up of the tegumentary envelope, which, in some of the class, always continues soft, but in the greater portion is very firm, forming a shelly case or armour, in which all the soft parts are contained. In the more perfect crustaceans it is complex. The following description of its component parts is from the pen of M. Milne Edwards, who in his 'Histoire Naturelle des Crustacés' (Tome premier, Paris, 1834, 8vo.), and in the article Crustacea in the 'Cyclopædia of Anatomy and Physiology' (Vol. i., London, 1836), has given the latest and best information on a subject which would fill a volume, and of which our limits will only permit us to give a sketch. Taking the Brachyura, or short-tailed crustaceans, as his instance of the more highly developed forms of the class in which the complex structure is exhibited, he thus proceeds: 'The integument consists of a *corium* and an *epidermis*, with a pigmentary matter of a peculiar nature, destined to communicate to the latter membrane the various colours with which it is ornamented. The *corium* or *dermis*, as among the Vertebrata, is a thick, spongy, and very vascular membrane; on its inner surface, it is intimately connected with a kind of serous membrane, which lines the parietes of the cavities in the *Crustacea* in the same manner as the serous membranes line the internal cavities among the Vertebrata; these two membranes, divided in the latter order by the interposition of muscular and bony layers, which cover and protect the great cavities, become closely united when these layers disappear as they do in the *Crustacea*, in consequence of the important changes that take place in the conformation of the apparatus of locomotion. The *corium* again, among the *Crustacea*, is completely covered on its outer surface by a membranous envelope unfurnished with blood-vessels, and which must be held in all respects as analogous to the epidermis of the higher animals. It is never found in the properly membranous state, save at the time of the *Crustacea* casting their shell; at this period, it is interposed between the *corium* and the solid covering ready to be cast off, and has the appearance of a pretty dense and consistent membrane, in spite of its thinness. It forms, as among animals higher in the scale, a kind of inorganic lamina, applied to the surface of the *corium*, from which it is an exudation. After the fall of the old shell, it becomes thicker and very considerably firmer, owing to the deposition or penetration of calcareous molecules within its substance, as well as by the addition of new layers to its inner surface. The degree of hardness finally acquired, however, and the amount of calcareous matter deposited within it vary considerably; in many members of the class, it remains semicorneous, in a condition very similar to that of the integuments of insects, with which, moreover, it corresponds very closely in point of chemical composition; in the higher crustaceans again, its composition is very different: thus, whilst *Chitine* in combination with albumen is the principal element in the tegumentary skeleton of some species, this substance scarcely occurs in the proportion of one or two-tenths in the carapace of the *Decapods*, which, on the contrary, contains sixty and even eighty per cent. of phosphate and carbonate of lime, the latter substance particularly occurring in considerably larger proportion than the former. With regard to the *pigmentum*, it is less a membrane or reticulation than an amorphous matter diffused through the outermost layer of the superficial membrane, being secreted like this by the *corium*. Alcohol, æther, the acids, and water at 212° Fahr. change it to a red in the greater number of species; but there are some species in which it may be exposed to the action of these different agents without undergoing any perceptible change. The epidermic layer hardened in different degrees is the part which mainly constitutes the *tegumentary skeleton* of the crustacea. In its nature it is obviously altogether different from that of the internal skeleton of the Vertebrata; still its functions are the same, and this physiological resemblance has led naturalists to speak of these two pieces of organic mechanism, so dissimilar in their anatomical relations, under the

common name of *skeleton*. The tegumentary skeleton of the Crustacea consists, like the bony skeleton of the Vertebrata, of a great number of distinct pieces connected together by means of portions of the epidermic envelope, which have not become hardened, in the same way as, among the higher animals, certain bones are connected by cartilages, the ossification of which is only accomplished in extreme old age.

This *skeleton*, or crustaceous frame-work, consists of a series of rings varying in number, the normal number of the body segments being twenty-one. Instances of a larger number are rare, and a less number seldom occurs; one or more rings may be apparently absent, but in such cases they will generally be found consolidated as it were. In the embryo the segments are developed in succession from before backwards; the posterior rings, therefore, are generally absent when the number is defective. Each ring is divisible into two arcs, one upper or dorsal, the other lower or ventral. Each arc may present as many as four elementary pieces. Two of these united in the mesial line form the tergum, the sides of this upper arc are framed of two other portions denominated *flanks* or *epimeral pieces*. The lower arc is a counterpart of the upper. Two of the four pieces into which it is divisible constitute the *sternum*, situated in the mesial line, and are flanked by two *episternums*. These two arcs do not cohere at their edges, but a space is left for the insertion of the lateral appendages or *extremities* which correspond with them. (Milne Edwards. Audouin.)

The one-and-twenty rings above mentioned are generally divisible into three sections of seven each, and may be considered as corresponding with the three regions which zoologists have generally consented to recognize in the bodies of the crustaceans, under the denominations of a *head*, a *thorax*, and an *abdomen*, but the student should be on his guard against the false impressions which, as M. Milne Edwards observes, are likely to arise from these terms, by their leading the mind to liken them to the grand divisions in the Vertebrata, which are defined by the same expressions.

The cephalo-thoracic portion and carapace first claim our attention, and the latter acquires its greatest development in the Decapods. 'In these animals,' says M. Milne Edwards, 'the frame-work of the body does not appear at first sight to consist of more than two portions, the one anterior, formed by the carapace, and representing the cephalic and thoracic segments conjoined; the other posterior, formed by the abdomen. In reality, the first fourteen rings of the body are covered by this enormous buckler, and are so intimately conjoined as to have lost all their mobility; the whole of the thoracic segments thus hidden below the carapace are connected with it in their superior parts; they are only joined with one another underneath and laterally; and their tergal parts, having, in consequence of this, become useless, are no longer to be found, being in some sort replaced by the great cephalic buckler; thus the whole of these rings, in conformity with this arrangement, are imperfect and open above.'

The subjoined cut represents the carapace of a Brachyurous or short-tailed crustacean, and the regions of which it is composed, named after the viscera and organs protected by them.

[Carapace of *Carcinus mænas* (*Cancer mænas*, Linn.)]

a, a, Region of the stomach, or stomachic region; *b*, genital region; *c*, cordial region; *d*, posterior hepatic region; *e, e*, branchial regions; *f, f*, anter. or hepatic regions.

And the following represents the carapace of a Macrouros or long-tailed Crustacean.

[Carapace of *Astacus fluviatilis*, common crawfish.]

a, Stomachic region; *b*, genital region; *c*, cordial region; *d*, posterior hepatic region; *e, e*, branchial regions.

The *abdomen* is most fully developed in the Macrouros, or long-tailed Crustaceans, in many of which it becomes a very important organ of motion, and in them there is a comparatively small development of the carapace, while in the Brachyura, or short-tailed Crustaceans, this rule is reversed, the abdomen being comparatively small, and the great development taking place in the carapace, illustrating the 'loi de balancement organique' of M. Geoffroy St. Hilaire. The types above alluded to, the *common crab* and *common lobster*, afford striking examples of this law of organic equivalents.

[View of the underside of the female, with the tail or abdomen extended.]

a, b, c, d, e, sternal pieces; *f, g, h, i*, latero-sternal pieces; *k, k*, external apertures of the female organs of generation; *l, l, l*, abdominal appendages or false feet. The detached figure represents one of these appendages removed from the abdomen.

[View of the under side of the male, with the exciting or directing organs. The detached figure represents one of these organs with the abdominal appendage or false foot beneath it].

In the subjoined cuts will be seen the relative proportions and positions of the sternum and abdomen in *Thelphusa fluviatilis*, one of the Brachyura; we have given the whole of the description now to prevent trouble and confusion to the reader, who will be able to refer to the figures when the organs represented are alluded to hereafter.

Having thus endeavoured to give an outline of the tegumentary skeleton of the body of this class, we must next draw the attention of the reader to a necessary consequence of the condition of the animal, inclosed as it is in most of the class in a hard shell. If the crustaceans were not gifted with a power of throwing off this hard shell or case, all growth would be stopped, excepting increase of thickness in the shell by a succession of secretions from below. To allow, therefore, room for the expansion and growth of the body and limbs, a provision for their increase is made by means of an

Ecdysis or *Moult*, which, as a general rule, is more frequent the younger the animal is, as indeed might be expected. Thus eight moults in the short space of seventeen days have been observed in a young *Daphnia* (BRANCHIOPODA, vol. v., p. 342, &c.) For the mode in which this liberation is performed in the Brachyurous Crustaceans the article CRAB (p. 126) may be consulted; and the common crawfish, *Astacus fluviatilis*, will serve as an example of the manner in which the *Macroura* cast their shell. We have indeed more than once heard strong suspicions expressed that, in the case of the crawfish particularly, no ecdysis takes place, and that the old shell is got rid of by absorption. By those who took this view of the subject it has been somewhat triumphantly asked, 'whoever found the cast-off shell of a crawfish?' and it was not an easy question to answer for those whose pursuits had not led them to the streams which the animals haunt; but they who have looked for the *exuviae* at the proper time and place have seen them in abundance. The crawfish does throw off its old shell towards the end of summer or in the beginning of autumn*; and Reaumur saw it done.

The change is preceded by a few days of fasting and sickness, and at that time the carapace becomes loosened from the corium to which it was attached. The corium begins forthwith to secrete a new shell, which is at first soft and membranous, becomes gradually harder and harder, and is at last calcareous. When all connexion with the old shell is broken off, and the corium has completely secreted the new membranous envelope, the animal begins to set about freeing itself from the old incumbrance, and becomes very restless, the symptoms of inquietude increasing in proportion as the time for emancipation draws nigh. It rubs its legs one against the other, and finally throws itself on its back. In that situation it begins to shake itself and swell itself out, till it tears the membrane which connects the carapace with the abdomen, and begins to raise the former: then it rests a while. Alternations of agitation and rest succeed each other at intervals of longer or shorter duration, the carapace is completely raised, the head, the eyes, the antennæ, are extricated. The greatest difficulty occurs in freeing the extremities, nor could they be extricated at all did not the old covering split longitudinally: and indeed it frequently happens that the crawfish leaves a limb or two behind; and is sometimes so fettered, that it perishes from inability to extricate itself. The abdomen is the last division of the body freed, and the whole change generally takes place in half an hour. Four-and-twenty hours, or two or three days at furthest, are necessary for the conversion of the soft and membranous integument which sheathes the corium or naked body into a firm calcareous case similar to the last, and presenting the same appendages, even to the hairs, which last, observes M. Milne Edwards, are not contained within the old ones as Reaumur imagined, but exist ready-formed in the new envelope, turned in towards the interior like the fingers of a glove turned in upon itself.

M. Milne Edwards observes, that the time occupied in the business of throwing off the shell varies considerably in different species, and that it also depends on atmospheric influences, and this observation applies equally to the number of days required for giving the new tegumentary sheath the consistency of the old shell; and he adds, that in the whole of the species which have been duly watched, especially those found on the French shores, the period which

precedes and that which follows the ecdysis is a period of inquietude and disorder. The muscles are then flaccid, the flesh is soft and watery, and the animals are considered unwholesome and unfit for food. An exception to this remark occurs in the land-crabs (*Gecarcinus*), which, according to the testimony of all who have spoken and written on the subject, are never so delicious as during the season of change.

At the period of *ecdysis*, rounded, flattened calcareous concretions (carbonate of lime), commonly called *oculi cancrorum*, are formed at the sides of the stomach of the common river crawfish. (See Preparation 406 in the Museum of the College of Surgeons, and *Catal. of the Physiological Series*, vol. i., p. 406.)*

Every one has occasionally been struck with the difference of size in the members of crabs and lobsters. One claw of these, and other crustaceans which have the claws, when perfect, nearly equal, is often found of its full volume, while the other is comparatively diminutive; for the animal, upon the limb receiving any injury, has the power of suddenly throwing it off, and the effort does not appear to be attended with pain, though it is frequently made when the system receives a severe shock. (*ASTACUS*, vol. ii., p. 514.) The point at which the separation takes place is always in the second articulation, near the basis of the limb, and from the stump, which speedily cicatrizes, a new claw buds forth with all the proper articulations, and with an entire, though miniature, resemblance to the rejected member. This new claw increases slowly, and requires considerable time to attain the full size. It is generally stated, that if one of the limbs be severed in any other place than the usual point of separation the stump goes on bleeding, nor does it heal. In such cases the renovating process does not commence until the animal succeeds in separating the remains of the member at the proper point, and this it is supposed to do by a violent muscular contraction. Some time ago there were some land-crabs (*Gecarcinus*) at the garden of the Zoological Society, and the apparent ease with which they parted with their smaller legs in order to escape from any one who injudiciously took them up by those members was very remarkable. They did not seem to regard the loss at all, and ran away on the remainder of their legs as if nothing had happened. There was no opportunity of observing the mode of reproduction in this case, for the animals were brought to the garden from the West Indies late in the summer, and they did not survive the cold weather. We will now consider these and other

Organs of Locomotion.—Of the different writers who have treated this subject, the summary given by M. Milne Edwards appears to us to be the most instructive, and we therefore select it. It is clear and condensed, and we give it in his own words, for we know of no method equally concise of conveying adequate ideas of this curious piece of animal mechanism.

'The kind of solid sheath formed by the tegumentary skeleton of the crustacea, and which includes in its interior the whole of the viscera and other soft parts of these animals, is required to be so constructed as not to oppose locomotion; consequently there exist, either between the different rings of the body or the various constituent elements of the limbs, articulations destined to admit of motion to a greater or less extent between these different pieces. The structure of these articulations is of the most simple kind; the moveable piece rests upon that which precedes it by two hinge-like joints, situated at the two extremities of a line perpendicular to the plane in which the motion takes place. In the internal portion of the edge of the moveable piece comprised between the joints, there exists a notch of greater or less depth, destined to admit of flexion, whilst on the opposite or external side the same edge generally glides under that of the preceding piece. This kind of articulation, whilst it is the most favourable to precision of movement and to strength, has the disadvantage of admitting motion in one plane only; therefore the whole of the rings of the body, the axis of motion being entirely parallel, cannot move save in a vertical plane; but nature has introduced a kind of corrective of this disadvantage in the structure of the limbs, by changing the directions of the articular axes, whence ensues the possibility of general motions being performed in every direction. Between the two fixed points two opposed empty spaces are observed, left by the rings severally,

* The season of ecdysis in the crawfish seems to vary occasionally in different localities.

* There is a most interesting series of preparations in the Museum of the College of Surgeons, showing the process of moulting. See p. 193.

and destined to admit of the occurrence of motions of flexion and extension. The tegumentary membrane which fills it never becomes encrusted or calcareous, but always continues soft and flexible.

'The tegumentary skeleton supplies the apparatus of locomotion with fixed points of action as well as with the levers necessary to motion. The immediate or *active* organs of this apparatus are the muscles, the colour of which is white, and the structure of which presents no peculiarity worthy of notice. They are attached to the pieces which they are required to move either immediately or by the intermedium of horny or calcareous tendons, which are implanted upon the edge of the segment to which they belong. To the fixed point they are most commonly attached immediately. Their structure is simple, and each segment in fact, as has already been said, being contrived to move in one fixed and determinate plane, the muscles which communicate motion to it can constitute no more than two systems antagonists to each other, the one acting in the sense of *flexion*, by which the segment moved is approximated to that which precedes it; the other in the sense of *extension*, by which the segment is brought into the position most remote from the centre of motion. The muscles that produce these opposite effects, as might have been concluded, are found implanted into the opposite arms of the lever upon which their energy is extended.

'The motions in flexion tend universally to bring the extremities and the different rings towards the ventral aspect of the body; it is consequently upon this aspect that the flexor muscles are inserted, and these are in general the more powerful. On the contrary, and in accordance with the nature of the motion produced, it is upon the superior or dorsal aspect of the segments that the exterior muscles are attached. In the trench the two orders of muscles generally form two distinct layers, the one superficial, the other deep; the former thin and sometimes absent, the second, on the contrary, very powerful wherever powerful motions are required. The muscles generally extend from the arc above to the one immediately below, passing for the most part from the anterior edge of the upper to the anterior edge of the lower segment. The extent and the direction of the flexion of which any segment is susceptible depend on the size of the interannular spaces above or below the ginglymoid points, and as these spaces are in general of considerable magnitude on the ventral aspect, whilst the superior arcs are in contact, and can only ride one over another in a greater or less degree, it is only downwards that the body can be bent upon itself, while upwards, or in the sense of extension, it can hardly in general be brought into the horizontal line.

'Thus far what has been said applies more especially to the rings of the body, but the extremities present nothing that is essentially different, either as regards the mode in which the tubular segments are articulated to one another, or as regards the mode in which the muscles are inserted. Each of these indeed having but one kind of motion, and even that very limited in its extent, nature has aided the deficiency, as has been stated, by increasing the number of articulations, by which extent of motion is conferred, and in varying the direction of the articular axes, an arrangement by which the animal obtains the ability of moving in every direction, but at the expense of power, rapidity, and precision in its motions. Each segment of a limb incloses the muscles destined to move that segment which succeeds it, unless it be too short and weak for this end, in which case the muscles themselves have their origin at some point nearer to the median plane of the body. As a general law the muscles are observed to be more powerful in proportion as they are nearer to the centre, which is to be explained by the fact, that each motion they then communicate is transmitted to a larger portion of a limb, to a lever longer in that sense in which it is disadvantageous to the power. Occasionally however the two last segments of a member are converted into a sort of hand, and in this case the penultimate segment sometimes includes a muscular mass, which may surpass in power the same system in the whole of the limb besides. Those muscles that put an extremity generally into motion are attached to the sides of the thoracic cavity, and the apodemata supply them with surfaces of insertion of great extent, and very favourably situated as regards their action. They occupy the double rank of cells formed by these laminae, but they vary too much in their mode of arrangement to admit of our saying anything

generally upon this head. The motion of translation or from place to place, the only kind upon which it seems necessary to say anything here, are effected in two modes, either by the alternate flexion and extension of the trunk, or by the play of the limbs.

'In those Crustacea which are formed essentially for swimming, the posterior part of the body is the principal agent in enabling the animal to change its place; but here the motions, instead of being lateral, are vertical; and instead of causing the creature to advance they cause it to recede: it is by bending the abdomen suddenly downwards, and bringing it immediately under the sternum, that it strikes the water, and consequently by darting backwards that the animal makes its way through the liquid. (ASTACUS, vol. ii., p. 513.) From what has now been said it may be imagined that the Crustacea whose conformation is the best adapted for swimming have the abdomen largely developed, and this is in fact what we always observe; the Amphipoda and Decapoda Macroura are examples; whilst in the walking Crustacea, such as the crabs, the Caprella, the Oniscus, &c., this portion of the body attains but very insignificant dimensions. In the swimming Crustacea, the appendages of the penultimate segment of the abdomen also become important organs of locomotion, inasmuch as they for the most part terminate in two broad horizontal plates, which, with the last segment, also become lamelliform, constitute an extensive caudal fin arranged in the manner of a fan. We have already said that the thoracic extremities alone constitute true ambulatory limbs. When destined for swimming only, their segments are lamelliform, and the palp, as well as the stem, contributes to form the kind of oar which each of them then constitutes.

'To conclude, the stemmatous portion of the thoracic extremities, whilst it still preserves the general form which we have assigned it, is modified in some cases to serve for walking as well as swimming, or to aid the animal as an instrument for burrowing with facility, and making a cavity for shelter among the sand. Thus in the Decapods that burrow, the last segment of the tarsus assumes a lanceolated form, and in the swimming Brachyura, the same segment, especially of the last pair of extremities (*Matuta*, for example), appears entirely lamellar.'

We have only further to add, that in a great number of species one or several pairs of the thoracic extremities are modified so as to become instruments of prehension; sometimes it is the last segment of the limb which, acquiring more than usual mobility, bends in such a manner as to form a hook with the preceding segment; sometimes it is this penultimate segment which extends below or by the side of the last, so as to form a kind of immoveable finger with which it is placed in opposition. In the first instance these instruments are denominated *subcheliform* claws, in the second *chelae* simply, or *cheliform claws*.

Any one who will take the trouble of going over this excellent description with a common crab and lobster before him, will have a clear idea of the locomotive system in these animals.

[Claw (cheliform) of *Thelphusa fluviatilis*.]

a, moveable finger; b, hand (manus) and immoveable finger; c, carpus, or wrist.

[Posterior foot of *Thelphusa fluviatilis*.]

a, Haunch (hanche); b, trochanter; c, thigh (femur); d, leg; e, metatarsus; f, tarsus, or nail.

Organs of Digestion.—The cheliform or subcheliform claws may be considered as ancillary to this important part of the organization of the Crustacea; and there are other parts, the details of which we proceed to give before we enter at large into this part of the subject.

[Jaw-feet (pieds machoires), &c. of *Thelphusa fluviatilis*.]

1, Right external jaw foot; A, its internal blade; a, b, c, d, e, f, its various articulations; B, its external blade, or flabelliform palp; 2, jaw of the fourth pair with its palp; 3, jaw of the third pair with its palp; 4, jaw of the second pair; 5, jaw of the first pair; 6, mandible with its palp; 7, upper lip; 8, tongue (languette) or lower lip.

The maxillary limbs above represented, which constitute the jaws in the *masticating crustaceans*, reach in them their highest development; whilst in the *sucking crustaceans*, which are parasites, and feed on the juices of other animals, a great difference of structure is, as might be expected, observable, certain parts of the apparatus being elongated into a proboscis or tube of longer or shorter dimensions adapted for sucking, and in the interior of which are two slender pointed processes that act as lancets, for the purpose of perforation, in lieu of the true mandibles.

The basilar articulations of the anterior thoracic extremities in many species are employed to seize, hold fast, and in a considerable degree comminute, the food; and the most perfect development of this design is manifested in the cheliform claws of the lobsters and crabs, with all their admirable modifications for powerful prehension.

The *mouth* is a mere opening of the short *œsophagus*; nor is it furnished with a tongue—the organ so named (*langua* and *languette*) is no more than a horny and lamellar process, performing in a degree the functions of a lower lip. The *œsophagus*, which terminates without any interruption in the stomach, and both parts, with one striking exception in the case of the latter, which we shall presently mention, present nothing remarkable, consisting as well as the whole of the intestinal canal of two membranous layers, and presenting a considerable resemblance to the same part of the organization of the higher animals. The *stomach* is globular and capacious, occupying much of the area of the cephalic cavity, and consisting of two distinct portions: 1. The cardiac region, surmounting the mouth and *œsophagus*; 2, The pyloric, placed behind the cardiac region.

Around the *pylorus* is situated that extraordinary apparatus of hard tubercles or sharp teeth, which operate as grinding or tearing organs on the food submitted to the action of this animal mill; and though the different pieces vary considerably in different species, their greater or less development depending upon the nature of the food taken by those species, they may be traced in all the *Brachyura* and *Macroura*. In *Squilla* this masticatory framework is reduced to two half-horny pieces, with rounded projections; and to make up for this deficiency, a branch of each mandible reaches down to the pyloric orifice.

From the *pylorus*, the *intestine* proceeds direct to the vent, there being no convolution; but in the higher crustaceans, it is distinguishable into two portions to which the names of *duodenum* and *rectum* have been applied, and which are sometimes, in the lobster for instance, separated by a valve, but more frequently are without defined limits. In the lower crustaceans the intestine is cylindrical, and offers no difference throughout its whole length from the stomach to the *vent*, which is always situated in the last

ring, and has its orifice closed by muscular fibres which perform the functions of a sphincter.

The *liver* is largely developed in many of the Crustacea, especially in the Decapods; indeed, no one can eat a crab or a lobster without being struck with the large proportions of this viscus, which in those species is considered so delicious. In the Edriophthalmians, on the contrary, it is almost rudimentary, there being in them only three pairs of biliary vessels, much resembling those of insects. The organ, when well developed, consists of two symmetrical portions, generally separated from each other, and composed of a collection of *cæcums*, which at one of their extremities discharge their secretion into excretory ducts, which being converted by their union into longer and larger vessels, pour the bile ultimately through a double channel into the pylorus. The nature of the whitish fluid secreted by the two, and, as it is said, in some cases three, elongated blind tubular worm-like organs, the first two situated on each side of the pylorus, and the third on the middle of the intestine a short way below them, is not known, nor is its use.

The two green glandular organs placed on each side of the *œsophagus* are supposed to act in some degree as substitutes for *salivary glands*.

In the Museum of the Royal College of Surgeons, in London, are preparations of the stomachs of the river crawfish, the lobster, and of a large crab, Nos. 406 to 408, both inclusive.

Circulating System.—No chyliferous system, or, to speak more correctly, no system of chyliferous vessels, has yet been found in the Crustacea; and the best received supposition is, that the nutritious fluid is transferred from the intestine to the blood-vessels by imbibition. The *blood* is either without colour or of a slightly bluish tinge; very coagulable, and abounding in globules held in suspension.

Much has been written on the subject of the vascular system, one of great complexity, through which this fluid circulates; but notwithstanding the valuable labours of Willis, Swammerdam, Cuvier, and others, great difference of opinion and obscurity prevailed, till the researches of Lund, and especially those of MM. Audouin and Milne Edwards, intitled, '*Recherches Anatomiques et Physiologiques sur la Circulation dans les Crustacés*' (*Ann. des Sc. Nat.*, t. ii.), appeared. The following are the conclusions to which the latter distinguished naturalists came, after a careful study, as well of the anatomical disposition of the circulating apparatus of the Crustacea, as of the progress of the blood through its interior.

'The circulation of the blood in these animals is accomplished in a manner very similar to what takes place in the Mollusca. The blood, pushed forward by the heart, is distributed to every part of the body, from whence it is returned into large sinuses situated at no great distance from the base of the branchiæ; from these sinuses it is sent on to the respiratory apparatus, which it traverses, and from which it finds its way to the heart, to recommence the same circle anew. The *heart* is consequently *aortic* and *single*. The heart is always found in the median line of the body, and lying over the alimentary canal, near the dorsal aspect. Its form is various; in the Decapods it is nearly square, and lies in the middle and superior part of the thorax, being separated from the carapace by tegumentary membranes only, and may be seen in the space included between the two vaults of the flanks. In structure it appears to be composed by the interlacement of numerous muscular fibres, fixed by their extremities to neighbouring parts, and passing to some distance over the aggregate at either end, so that the whole organ brings to mind such a figure as would be formed by the superposition of a number of stars the rays of which do not correspond. In the other orders this general form of the heart varies considerably from the figure of an oblong square of rather inconsiderable size, as it occurs in the Decapoda, to that of a long cylindrical vessel extending through the whole length of the body, as it appears in the Stomapoda and the Edriophthalmians. In the former of these it gives origin to six vascular trunks, three of which issue from the anterior edge, and three from the posterior surface; each of the six openings is closed by a valvular apparatus, which prevents the regurgitation of the blood.

'The first of the three anterior vessels is situated in the median line, and is distributed to the eyes, in consequence of which we have entitled it the ophthalmic artery. Lodged within the substance of the general tegumentary membrane,

it continues its course without undergoing any subdivision along the median line through the whole length of the thorax, until, arrived opposite the eyes, it subdivides and terminates in two branches, which penetrate the ocular peduncles. On the two sides are the two antennary arteries. They run obliquely towards the antennæ, sending off numerous branches to the tegumentary membrane, in which they are at first lodged; they then plunge more deeply, sending branches to the stomach and its muscles and to the organs of generation, between which they insinuate themselves by following the folds of the same membrane which parts them. Lastly, each of these vessels sub-divides into two branches, one of which proceeds to the internal and the other to the external antenna.

Two hepatic arteries arise from the fore part of the inferior surface of the heart, and penetrate the liver, there to be ramified; but they are only found double and distinct from one another so long as the liver is met with divided into two lobes, as it is in the crawfish and lobster.

From the posterior part of the same surface of the heart there proceeds a large trunk, which, from its importance, might be compared with the aorta. This is unquestionably the vessel which many authors have spoken of as a great vena cava; we have entitled it the *sternal* artery. It bends forwards, giving origin to two abdominal arteries, dips into the sternal canal, distributing branches to the different thoracic rings, as also to the five first cephalic rings, which it passes over in its course. Meeting with the œsophagus, it bifurcates, but still sends branches to the mandibles and the whole of the anterior and inferior parts of the head.

The bulb presented by the sternal artery at its origin, in the Macroura, is the part which Willis characterized as *auricle* of the heart. As concerns the two abdominal arteries, which may be distinguished into *superior* and *inferior*, and which arise from the kind of cross which it forms almost immediately after its exit, they are in precise relationship in point of size with the magnitude and importance of the abdomen itself. In the Brachyura they are mere slender twigs; in the Macroura, on the contrary, they are capacious stems, and the inferior of the two sends branches to the two posterior pairs of thoracic extremities.

The disposition of the three first vessels is the same in the Stomapoda as in the preceding species; but the great vessel which represents the heart being extended through the whole length of the body, supplies immediately other arterial branches in pairs, and in number equal to those of the rings.

The blood returns from the different parts of the body by *canals*, or rather *vacuities*, among the tissues (for they have no very evident appropriate parietes), which terminate in the *venous sinuses* situated close to the branchiæ.

In the short-tailed Decapoda we find no more than a double series of these sinuses included within the cells of the planes above the articulation of the extremities. They communicate with one another, and they appear to have no parietes other than laminæ of cellular membrane, of extreme tenuity, which cover the neighbouring parts. Each of them, nevertheless, receives several venous conduits, and gives origin at its superior and external part to a vessel, which, traversing the walls of the planes at the base of the branchiæ, conducts the blood to the latter organs. This is the external or afferent vessel of the branchiæ.

We find the same lateral venous sinuses in the Macroura; but instead of communicating with one another athwart the thoracic septa, as is the case in the Brachyura, they all empty themselves into a great median vessel, which is itself a venous sinus, and occupies the sternal canal. In the Squilla this sinus is almost the only vessel which serves as a reservoir to the venous blood.

The blood, after being arterialized in its passage through the capillaries of the branchiæ, is poured into the *efferent vessel* which runs along the internal surface of each branchia. It enters the thoracic cells in the same manner as the afferent vessel passed out from them, bends upwardly under the vault of the flanks, and thus takes its course towards the heart. It is to this portion of the canal that we have given the name of *branchiocardiac vessel*.

The anatomical accuracy of the above description is generally admitted, but the physiological deductions of M. Lund differ from those of MM. Audouin and Milne Edwards. He regards the heart as destined to propel, not only the pure blood from the gills, but also an admixture of venous blood which enters the cavity of the heart by

four orifices, seated on its dorso-lateral aspects, and distinct from those in which the branchial veins terminate. The French anatomists have objected, that these orifices described by Lund are closed by a membrane; but we find them plainly shown, and provided with the valvular apparatus for preventing a reflux of the blood, in a preparation (No. 898 a.) added by Mr. Owen to the Hunterian Series illustrating the same subject in the museum of the College of Surgeons. John Hunter had long ago arrived at the same conclusions as to the mixed condition of the blood which is sent from the heart, and in a series of elaborate researches on the circulation in the crustaceans and insects, first discovered the diffused state of the venous blood in extensive and irregular venous sinuses; the general disposition of which, in the lobster, is well displayed in the four beautiful plates (15, 16, 17, and 18) illustrative of John Hunter's account of the circulating system of the lobster, in the Catalogue of the Physiological Collection, vol. ii.

This and other parts of the anatomy of the lobster are illustrated in the following preparations in the same collection:—Nos. 22, 60, 110, 223, 407, 408, 880, 898 a, 991, 992, 1301, 1302, 1302 A, 1303, 1303 A, 1303 B, 2204 A, 2205-2207 A; and the anatomy of the river crawfish in the preparations numbered 406, 993, 993 A, 2191-2204, the latter series being explanatory of the process of moulting.

Respiratory System.—The respiration of the crustacea is carried on generally by means of branchiæ. We say generally, because there are some forms where no special organs have been detected, and where it is presumed that oxygen is obtained from the water through the medium of the external integument. But where, as in the great mass of these animals, branchial respiration is present, the variety in form and disposition of the apparatus, and in some cases the complexity of it, are very great. Thus, in the Branchiopoda the lamellar form of all the thoracic extremities and the two external appendages corresponding to the palp and flabellum present membranous vesicles, flat in shape, highly vascular and soft, whose office it is to facilitate the action of the air upon the blood. In the Amphipoda and Læmodipoda we begin to perceive a gradual departure from this type. In the Læmodipoda the vesicular bodies produced by the flabelliform appendage of a certain number of pairs of the thoracic extremities, only perform the functions of branchiæ; and in the Isopoda the locomotive extremities cease to act as respiratory organs, the five first pairs of abdominal extremities being exclusively devoted to those duties. The Stomapoda, which in some cases are without determinate respiratory organs, in others present an organization analogous to that of the decapodous embryo, and again in the Squillæ and Thysanopoda exhibit a highly-complicated structure of branchiæ, which, though superior even to the highest type in complexity, still fall short of the perfection manifested in that type, inasmuch as the branchiæ float in the water unprotected by any envelope.

M. Milne Edwards thus reviews the respiratory apparatus in its state of greatest complexity, commencing with it in the embryo, and following it in its progressive development.

In the earliest periods of embryotic life of the common *Astacus fluviatilis*, we discover no trace of branchiæ; but at a somewhat more advanced stage of the incubation, though still before the formation of the heart, these organs begin to appear. They are at first small lamellar appendices of extreme simplicity, attached above the three pairs of maxillary extremities, and representing the flabelliform portions of these limbs. Soon these lamellar appendages elongate and divide into two halves, one internal, lamellar, and triangular, the other external, small, and cylindrical; lastly, upon the surface of this, striæ are observed to appear, which are the rudiments of the branchial filaments. During this interval the thoracic extremities have become developed, and above their bases other branchiæ have made their appearance, presenting in the beginning the form of tubercles, and subsequently that of stiletts, smooth and rounded on their surface, but by-and-by becoming covered with a multitude of small tuberculations, which, by their elongation, are gradually converted into branchial filaments similar to the preceding. During this period of the development of the branchiæ, these organs are applied, like the extremities, to the inferior surface of the embryo; but they subsequently rise against the lateral parts of the thorax, become lodged within a cavity situated under the carapace, and thus are no longer visible externally.

The cavity destined to protect in this manner the bran-

chial apparatus is neither more nor less than an internal fold of the common tegumentary membrane. It shows itself first under the guise of a narrow groove or furrow, which runs along the lateral parts of the thorax, below the edge of the lateral piece of the carapace. This longitudinal furrow is not long of expanding, and becomes consolidated by its superior edge with the internal surface of the carapace, which, by being prolonged inferiorly, constitutes the external wall of a cavity, the opening of which, situated above the base of the extremities, becomes more and more contracted, and ends by being almost entirely closed. The space in this way circumscribed incloses the branchiæ, and constitutes what is called the respiratory cavity of the Decapod Crustaceans.

From what has just been said, it would appear that the embryo of *Astacus fluviatilis* presents four principal periods with reference to the state of the respiratory apparatus: 1. that which precedes the appearance of this apparatus; 2. that during which the branchiæ are not distinguishable from the flabelliform appendages of the extremities, or in which it consists of simple lamellar or stiliform processes, which appear as mere processes of other organs especially dedicated to locomotion or mastication; 3. that characterized by the transformation of these extremely simple appendages into organs of a complex structure, entirely distinct from the extremities, but still entirely external; 4. and lastly, that during which the branchiæ sink inwards, and become lodged in a cavity especially adapted for their reception, and provided with a particular apparatus destined to renew the water necessary to the maintenance of respiration.

If we now turn to the examination of the apparatus of respiration in the different groups in which it exhibits important modifications, we shall, in the series of Crustaceans, encounter permanent states analogous to the various phases through which we have just seen the apparatus passing in the most elevated animals of the class. And, in fact, the first period which we have particularized above in the embryonic life of the Decapod is exhibited in the permanent condition of some inferior crustaceans, in which not only are there no special organs for respiration, but in which none of the appendices occur with such modifications of structure as would fit them to become substitutes for the branchiæ, in which, consequently, the process of respiration, that is the aeration of the blood, appears to take place over the surface of the body at large. The greater number of the Haustellate Crustacea, of the Entomostraca properly so called, of the Copepoda, and even of the Phyllosomata, appear to belong to this type of organization.

The branchial character is so inherent in this class, that it is preserved even in certain species that live on the land. The land-crab (*Gecarcinus*), for example, would die if long immersed in water; but this, as well as other land crustaceans, requires a certain degree of moisture to enable the branchiæ to act, and accordingly they never remove far from damp situations.

Nervous System and Senses.—The obscurity in which this part of the subject was involved has been greatly dissipated by the light thrown on it by many authors, among whom Cuvier, Rathke, MM. Audouin and Milne Edwards, and Mr. Newport stand pre-eminent.

The principles derived from the study of the gradual evolution of the nervous system in the common crawfish are, 1. the isolated formation of the nervous centres, independently of one another. The ulterior junction of the organs constitutes the law of centripetal development of M. Serres. 2. A tendency to conjunction by a motion transversely. 3. A second motion in the line of the axis of the body, producing a final concentration of a greater or less number of nervous centres, originally independent of each other.

The first of these conditions is well seen in *Talitrus*. On each side of the mesial line in this genus is a chain of ganglions, conjoined by nervous centres of simple construction, flattened, and somewhat lozenge-like in their outline. Thirteen pairs of these correspond to the thirteen segments of the body, the two nuclei of each pair communicating together in the same way that each pair is connected with its antecedent and succeeding pair, by means of medullary cords in the first case, and longitudinal cords in the second. Each of these pairs in all essentials is a counterpart of the other, the cephalic ganglion, which sends branches to the antennæ and eyes, not excepted. In *Phyllosoma* the tendency to centralization is more obvious, and in *Cymothoe*

the union of the medullary nuclei is accomplished, the approximated chains forming a single longitudinal series from head to tail.

In the types, as might be expected, the centralizing system is perfected by the actual conjunction of the nuclei, and here we must refer the student to the works above mentioned, more especially to those of Rathke, of Audouin, and Milne Edwards, and of Mr. Newport, and the beautiful preparations illustrative of this part of the organization of the crustaceans in the museum of the Royal College of Surgeons in London (Gallery, Nos. 1301 to 1303 B, both inclusive). We would particularly draw his attention to No. 1302 A, presented by Mr. Newport, 'showing the anterior and posterior, or motor and sensitive tracts, which constitute the cerebral or spinal column,' &c.; and to No. 1303 A, exhibiting the nervous system of *Scyllarus antarcticus*, and 1303 B, laying open that of *Pagurus pedunculatus*, both prepared by Mr. Owen. Mr. Newport's excellent and instructive paper 'On the nervous system of the *Sphinx ligustri* of Linnæus' (*Phil. Trans.*, part ii., 1834), including beautiful illustrations of the nervous system of the lobster, and showing its identity in principle with that of the *Sphinx*, should be carefully studied.

The conclusion formed by M. Milne Edwards in his *Histoire* is that 'the nervous system of the crustacea consists uniformly of medullary nuclei (ganglions), the normal number of which is the same as that of the members or rings of the body, and that all the modifications encountered, whether at different periods of the incubation, or in different species of the series, depend especially on the approximation, more or less complete, of these nuclei (an approximation which takes place from the sides towards the median line, as well as in the longitudinal direction), and to an arrest of development occurring in a variable number of the nuclei.'

Mr. Newport appears to have been the first who pointed out the double ganglionic chain in the *Lobster*, as being composed of two orders of fibres, forming distinct and superposed fasciculi or columns, designated by him columns of sensation and of motion.

The highest degree of nervous centralization is found in *Maia*, according to M. Milne Edwards, who lays down the following principles, the result of the experiments made by himself and M. Audouin, and his deep and elaborate investigation of the subject.

1. The nervous system is the system which entirely presides over the sensations and motions.

2. The nervous cords are merely the organs of transmission of the sensations and of volition, and it is in the ganglions that the power of perceiving the former and of producing the latter resides. Every organ separated from its nervous centre speedily loses all motion and sensation.

3. The whole of the ganglions have analogous properties; the faculty of determining motions and receiving sensations exists in each of these organs; and the action of each is by so much the more independent as its development is more isolated. When the ganglionic chain is nearly uniform through its whole length, it may be divided without the action of the apparatus being destroyed in either portion thus isolated,—always understood, that both are of considerable size, because, when a very small portion only is isolated from the rest of the system, this appears too weak, as it were, to continue its functions, so that sensibility and contractility are alike speedily lost. But where one portion of the ganglionic chain has attained a development very superior to that of the rest, its action becomes essential to the integrity of the functions of the whole.

It must not be imagined, however, from this that sensibility and the faculty of exciting muscular contractions are ever completely concentrated in the cephalic ganglions, and it seems to us calculated to convey a very inaccurate idea of the nature and functions of these ganglions to speak of them under the name of *brain*, as the generality of writers have been led to do, seduced by certain inconclusive analogies in point of form and position.

It is nevertheless to be remarked that in these animals an obscure tendency to the centralization of the nervous functions is observable in the anterior portion of the ganglionic chain; because, if, in the lobster, for instance, it be divided into two portions, as nearly equal as possible, by severing the cords of communication between the ganglions belonging to the first and second thoracic rings, sensibility, and especially mobility, are much more quickly

lost in the posterior than in the anterior half, and this disproportion is by so much the more manifest as the division is performed more posteriorly; still there is a great interval between this first indication and the concentration of the faculties of perception and of will in a single organ—the brain, of which every other portion of the nervous system then becomes a mere dependency.' (*Cyclo. of Anat. and Phys.*)

Sight.—This sense is possessed by the whole of the class at some period of their lives, and in the great majority the organ is of a highly complicated structure. The parasitic crustacea, which undergo a kind of metamorphosis, possess eyes in the early stage of their existence, though they are subsequently obliterated; but the great mass of crustaceans are gifted with the power of distinguishing objects through the medium of light from their birth to their death. We will now examine the different forms presented by the visual apparatus.

Smooth or simple Eyes.—These consist of a smooth rounded transparent cornea, being a modification of the tegumentary membrane, immediately behind which, and in contact with it is the *crystalline lens*, generally spherical, and behind this last and in contact with it is a mass of gelatine, which performs the function of the *vitreous humour*, and touches the extremity of the optic nerve. A thick deep-coloured pigment envelops the whole and lines the inner surface of the eye-globe up to the point at which the transparency of the cornea begins. *Limulus* (Molucca crab, king crab) affords an example of this kind of eye. The simple eyes have never been found to exceed two or three in number.

Intermediate Eyes.—*Nebalia*, *Branchipus* and *Daphnia* present us with the *first modification* of a visual structure intermediate as it were between the *simple* and the *compound* eyes. In this organization the cornea is still undivided externally, but a number of small crystalline lenses and vitreous humours, each in its separate pigmentary sac and terminating in immediate contact with the optic nerve, present an eye consisting of a conjunction of several stemmata or simple eyes under a common cornea—*Apus* [BINOCULUS], besides its pair of simple eyes, has also a posterior compound pair. The *second modification*, which is to be found in the Edriophthalmians (*Amphithoe*, for instance), brings us still nearer to the truly compound form with distinct facets. Two transparent laminae form the *cornea* in these crustaceans: the external is smooth and undivided, the internal divided into a variable number of hexagonal facets, each with a distinct cornea which are superposed upon the conical crystalline lens, which is an ingredient in *compound eyes* properly so called.

Compound Eyes.—The external and internal membranes, the junction of which forms the *cornea*, present simultaneously the division into facets, each of which forms anteriorly an ocular compartment. Unlike the facets in the eyes of insects which are always hexagonal, these present various figures in different crustacea. In *Scyllarus*, *Galathea*, the common crawfish, &c., for example, they are square: in *Pagurus*, *Squilla*, the crabs, &c., they are hexagons. The crystalline humour that succeeds them immediately, is, according to M. Milne Edwards, 'of a conical form, and is followed by a vitreous humour having the appearance of a gelatinous filament, adhering by its base to the optic nerve.' Each of the columns thus formed is, moreover, lodged within a pigmentary cell, which likewise covers the bulb of the optic nerve. 'But the most remarkable circumstance is, that the large cavity within which the whole of these parallel columns, every one of which is in itself a perfect eye, are contained, is closed posteriorly by a membrane, which appears to be neither more nor less than the middle tegumentary membrane pierced for the passage of the optic nerve, so that the ocular chamber at large results from the separation at a point of the two external layers of the general envelope.' * * * 'The most remarkable modification of faceted eyes consists in the presence of a kind of supplementary lens, of a circular shape, and set within the cornea in front of each proper crystalline lens. These small lenticular bodies exist independently, and are perfectly distinct from the small corneal facets. In some cases they might be mistaken, (in the *Idotea* for example, where they may be perceived singly, and with their distinct circular forms,) and the incautious observer led to conclude that the corneal facets are merely these lenticular bodies so much enlarged that their hexagonal or square forms result from

their agglomeration in a point; but there are crustacea, such as the *Callianassa*, in which these two elements of the external cornea may be perfectly distinguished, the lenticular body being of insignificant dimensions, and occupying the centre of the corneal facet only. In general, however, the diameter of the lenticular body is equal to that of the corneal facet itself, so that their edges blend. Further, the lenticular bodies are most commonly evolved in the substance of the cornea; but there are cases in which, under favourable circumstances, they may be detached from it. Although the existence of these different modifications must not be considered as being exclusive, inasmuch as there are certain crustacea which exhibit more than one of them at the same time, for instance, *stemmata* and *compound eyes*, the latter only are the species of visual organ encountered in the great majority of cases. Their general number is two; but these are occasionally united, so as to form a single mass, and make the animal appear, at first sight, as if it had but a single eye. This peculiarity of organization can even be followed in the *Daphnia* [BRANCHIOPODA], in the embryo of which the eyes are first seen isolated; with the progress of the development, however, they are observed gradually to approach each other, and finally to become united. *Stemmata* are always immoveable and sessile; the *compound eyes* with *smooth cornea*, however, although in the majority of cases they present the same disposition, now and then occur moveable: sometimes they are supported by a pedicle, moveable in like manner and provided with special muscles. The eyes with facets present the same modifications, and even supply important characters in classifying these animals: thus in the *Edriophthalmia* the eyes are always immoveable and sessile, whilst in the *Decapoda* and *Stomapoda* they are supported upon moveable stems of very various lengths, and which every consideration leads us to view as limbs or appendages of the first cephalic ring. It sometimes even happens that in these animals, between the outer edge of the carapace and the base of the antennae, there occurs a furrow or cavity, within which the eyes may be withdrawn or laid flat, so as to be out of the way of injury; this groove or cavity is generally spoken of under the name of the orbit.' (*Cyclo. of Anat. and Phys.*)

In some of the forms (*Maia* for instance) there is a fringe of hairs on the inner side of the orbit, so placed as to perform the office of a brush in wiping the eye when brought into contact with it.

Hearing.—A cavity full of fluid, supplied with a nerve fitted for the perception of impulses of sound, forms the basis of the auditory system in the crustacea. This apparatus is assisted by certain organs, elastic membranes, and rigid stems for instance, organized so as to vibrate under the action of sonorous undulations, or to assist such vibration. The long rigid stem formed by the antennae of the second pair assists in this function, and, according to the highly interesting experiments of M. Savart, the addition of such a rigid stem renders certain vibrations appreciable, which, without such a conductor, would be imperceptible. In many of the forms (*Maia* for instance) there is an *ossiculum auditus*.

In the museum of the College of Surgeons (Gallery, No. 1559 A) is a Hermit Crab (*Pagurus Miles*, Oliv.), prepared by Mr. Owen to show the organ of hearing, which is composed of a simple vestibular cavity situated at the under part of the basal joint of the external antennae. The cavity is surrounded by a dense crustaceous substance, except at the internal opening, where the auditory filament of the antennal nerve penetrates it, and at the opposite side, where an elliptical opening or fenestra is left, which is closed by the acoustic membrane: the membranes of sound affect this membrane, and are transmitted to the nerve, which is exposed on the left side. (Owen, *Cat. of Physiolog.*, series., vol. iii., part 1).

Smell.—Every lobster-pot that is baited on our coasts affords evidence that the Crustaceans are endued with the sense of smelling, but where the organ is seated is doubtful. M. de Blainville placed it in the antennae, where it certainly does not reside, according to M. Milne Edwards, who further states that the opinion of M. Rosenthal, who ascribes the function to a cavity which he discovered at the base of the first pair of antennae, requires to be supported by direct experiment.

Taste.—Though the crustacea have no true tongue, their selection of food and the preference exercised by them,

show that they are gifted with the sense of taste or a sense analogous to it. The seat of the faculty is most probably that portion of the tegumentary membrane that lines the inside of the mouth and œsophagus.

Touch.—The crust more or less calcarious with which the crustacea are covered forms a medium not calculated to convey external impressions of any delicacy. 'Nevertheless,' says M. Milne Edwards, 'in front of the head there are certain special organs which all the observations I have had an opportunity of making upon the organization of these animals lead me to regard as parts more particularly destined to be the seat of the sense of touch. These organs are the antennæ—those slender filaments possessed of a great degree of flexibility, of motility, and of sensibility. M. de Blainville was led to regard these organs as the seat of the sense of smell: but direct and conclusive experiment has satisfied us that the destruction of the antennæ has no influence whatever on the exercise of the sense of smell: and we are, on the same grounds, induced to believe them destined to the exercise of the sense of touch of considerable delicacy, unless we would imagine them as the instruments of some quite peculiar sense, the existence of which would be purely hypothetical. The number and disposition of these organs varies extremely. Some of the crustaceans at the very bottom of the series are wholly without antennæ, or are furnished with them in a merely rudimentary state. Some species have no more than a single pair; the normal number however is two pairs. In speaking of the tegumentary skeleton we have said to which of the rings these appendages belong; we shall only say further here, that they may be inserted on the superior or inferior surface of the head according to the respective development of the different pieces of which this segment is composed. They do not differ less widely in their form and composition, and under this double point of view present modifications analogous to those which we have specified as occurring in the extremities.'

a, right external antenna of *Thelphusa flaviatilis*; *b*, right antenna of the same. (Desmarest.)

Organs of Reproduction.

In the whole class the sexual organs are separate, that is, they never co-exist in the same individual, and the reproduction is oviparous. The apparatus is double, each branch being distinct, and in some cases, completely independent of its opposite. The celebrated hermaphrodite lobster (*Phil. Trans.*, 1730, p. 290), presented a different sexual organ on each side, and both the male and female portion were complete. In the more perfect crustacea the analogy between the male and female organs is so great as frequently to deceive the observer at first sight.

Male Organs.—Our limits do not permit us to enter into a detail of all the phases of this part of the organization in the crustacea, and we therefore select the *common crab*, not only on account of the facilities which it presents to the inquirer, but because the apparatus, especially in the season of activity, is so distinct and so highly developed. The testis is grape-like, the cluster consisting of four principal lobes, formed of numerous worm-like delicate canals, convoluted into pellets. The first portion is placed in the front of the thorax and terminated in a large coiled-up vessel situated on the side of the stomach; behind, and connected with it, is the deferent vessel, a convoluted canal of some size and of a milky colour. It is twisted about the thorax, and at last penetrates the cell of the last pair of limbs, opening outwardly on the basilar piece, the situation gene-

rally assigned to the aperture in the crustacea. 'In the ordinary state,' says M. Milne Edwards, 'the excretory canal terminates on the edges of the opening, but at the instant of sexual intercourse the extremity of the canal undergoes a kind of erection, and by becoming folded upon itself, like the finger of a glove, projects externally, so as to form a kind of penis adequate to the intromission of the fecundating fluid. This latter circumstance was long unknown to naturalists, who were accustomed to look upon the members of the first and second abdominal rings as the external male instruments. These two pairs of extremities, in fact, are distinguished from the rest by their shape, which is styliform, and their structure, which is tubular, being composed of two horny laminæ convoluted one upon another, the first including the second. But direct observation has deprived them of all claim to be considered as fulfilling any office of so much consequence in the economy of the crustacea as that of conveying the fecundating fluid from the body of the male into that of the female. At the most they can only be regarded as organs of excitation, and which the animal may perhaps employ at the same time to guide the male into the female organ.'

'The female reproductive apparatus of the crustacea in the highest state of complication, consists of an *ovary*, an *oviduct*, and *copulatory pouches*. The ovaries in the Decapoda brachyura resemble four cylindrical tubes placed longitudinally in the thorax, and divided into two symmetrical pairs, each opening into a distinct oviduct, yet communicating with one another by a transverse canal, and by the intimate union of the two posterior tubes in a portion of their length. The oviducts as well as the ovaries are of a whitish colour; they are short, and become united in their course to a kind of sac, the neck of which extends to the exterior of the animal's body; there is one of these on each side, and they are known by the name of the *copulatory pouches*. It is into these reservoirs that the male pours the fecundating fluid which is here stored up and applied to the ova as they pass in succession along and out of the oviducts. These, after a course which is never long, terminate at the vulvæ, openings formed in the sternal pieces of the segment which supports the third pair of ambulatory extremities.

'The *Anomoura* and *Macroura* have no copulatory pouches, and their vulvæ are situated on the basilar joint of the ambulatory extremities of the third pair. The mode in which fecundation is accomplished in these genera, is consequently much less apparent than in the *Brachyura*. Many writers are of opinion that this operation takes place in the interior of the ovaries, a process that appears by no means feasible on account of the inequality of development of the ova, which is such that the last of them are not in being even long after the first have been expelled. It would perhaps be more correct to suppose that fecundation does not take place till after the ova are laid, which we know to be the case among the *Batrachia* and the greater number of fishes.

'The female crustacean does not abandon her eggs after their extrusion. Those of the Decapods preserve them under their abdomen by means of the abdominal extremities modified in their structure. The *Edriophthalmia* again keep them under their thorax by means of the flabelliform appendages of the extremities belonging to the region: whilst the inferior genera, such as the *Entomos-traca*, &c. have suspended to the external orifices either horny tubes or a pair of membranous sacs which contain and transport them from place to place. These varieties in the accessory organs of generation are, in many cases, sufficient to distinguish the sexes: thus, among the Decapoda brachyura, the females are known at a glance by their wider abdomen, which is sometimes of such dimensions as to cover the whole sternum. Sometimes these sexual organs extend to the antennæ and to various other organs; sometimes it even influences the size, and occasionally, as we have said, the general external conformation is modified to such a degree, that the male and the female of one and the same species have been taken as types of two distinct genera.'

The progress and incubation of the ovum, though a subject of the highest interest, would, if detailed, occupy more space than can be allotted to the department which now occupies our attention, and we must content ourselves with stating that the majority of the class do not make their exit

from the egg till the whole of the organs necessary to their condition are developed, and till their form presents but slight differences from that which is presented by the adult animal. But it is otherwise in many of the crustaceans, especially those of the lower class, which may be said to be born prematurely, and then have to pass through a series of changes which have been properly termed metamorphoses before they reach their final shape. M. Milne Edwards observes that these changes, whatever their amount, depend on the following circumstances:—1st. The continuation of the normal work of development. 2nd. The unequal growth of different parts of the body; and, 3rd. The atrophy and complete ultimate disappearance of certain parts.

The following cut will convey some idea of the relative position of the parts in the carapace, and that of *Thelphusa fluviatilis* (p. 189) of the relative external position of the organs alluded to.

[*Carcinus mænas*, open.]

a, a, a, a, a, stomach; *b, b*, genital organs; *c*, heart; *d, d*, branchiæ; *e, f, f*, liver.

[*Astacus fluviatilis*, open.]

a, a, a, a, a, stomach; *b*, genital organs; *c*, heart; *d, d, d, d, d*, liver; *e, e*, branchiæ; *f, f*, muscles of the mandibles.

Geographical Distribution.—The class is most widely distributed, and the form seems adapted for every climate.

Place in the Animal Series.—The insects and arachnids are the forms to which the crustaceans bear the greatest relations.

Systematic Arrangement.

Almost every writer on this interesting class of animals has embodied his own views in their classification. Among the principal zoologists who have written on the subject, the names of Cuvier, Desmarest, Latreille and Leach, will, with many others, occur to the observer. We select the arrangement of M. Milne Edwards, because it is founded on anatomical investigation, and on actual experiment made in a great many instances by himself and M. Audouin.

M. Milne Edwards, then, makes the Crustacea to consist of two great divisions.

1st. Of those which have the mouth furnished with a certain number of organs, destined in an especial manner to the prehension or division of the food.

2nd. Those which have the mouth unfurnished with special prehensile or masticatory organs, but surrounded by ambulatory extremities, the bases of which perform the part of jaws. We shall take this second division first because it contains but one order, viz., the XYPHOSURA (*Xiphosura*). Example, *Limulus*.

But it is to the first division that the great mass of the crustaceans belong, and these are subdivided into two great groups.

1st. The MAXILLOSA or MANDIBULATA, which possess a mouth armed with jaws, &c.

2nd. The EDENTATA or HAUSTELLATA, whose mouth is prolonged in the shape of a sucker.

The MAXILLOSA are separated into four great sections.

I.

PODOPHTHALMIA.

These almost always possess true *branchiæ*, pedunculated and moveable *eyes*; *feet* or *extremities* vergiform, partly prehensile, partly ambulatory; and a thorax covered by a carapace.

The *Podophthalmia* contain two orders, the *Decapoda* and *Stomapoda*.

1st. DECAPODA, whose branchiæ are fixed to the sides of the thorax, and are inclosed in special respiratory cavities. The oral apparatus is composed of six pairs of members. There are five pairs of thoracic extremities, which are generally ambulatory. The DECAPODA are divided into 1st, the *Brachyura* (*Cancer*, *Portunus*, *Grapsus*, &c., &c.); 2nd, the *Anomura* (*Dromia*, *Ranina*, *Pagurus*, &c., &c.); 3rd, the *Macroura* (*Astacus*, *Scyllarus*, *Palæmon*, &c., &c.).

2nd. STOMAPODA, whose branchiæ are external; sometimes rudimentary or none. Oral apparatus composed in general of three pairs of members. Thoracic extremities prehensile or for swimming; generally six or eight pairs. (*Mysis*, *Phyllosoma*, *Squilla*, &c., &c.)

II.

EDRIOPHTHALMIA.

True branchiæ none, but replaced by certain portions of the extremities modified *ad hoc* in their structure; eyes sessile; thoracic extremities ambulatory, almost always consisting of seven pairs; no carapace. The *Edriophthalmia* contain three orders, viz., the *Amphipoda*, the *Læmodipoda*, and the *Isopoda*.

1st. AMPHIPODA. These have the *palpi* of the thoracic extremities vesicular, and subserving respiration. The *abdomen* is very much developed, subserving locomotion, and is furnished with six pairs of limbs, the three first of which differ in form and use from the three last. (*Gammarus*, *Talitrea*, &c., &c.)

2nd. LÆMODIPODA. Abdomen rudimentary. Palpi of the thoracic extremities vesicular and subserving respiration. (*Proto*, *Caprella*, &c.)

3rd. ISOPODA. Abdominal extremities well developed; the five first pairs lamellar and subserving respiration. Abdomen well developed. (*Idotea*, *Spheroma*, &c., &c.)

III.

BRANCHIOPODA.

No true *branchiæ*, but thoracic extremities lamellar, membranous, and so formed as to be subservient to respiration. The *Branchiopoda* contain two orders, *Phyllopoda* and *Cladocera*.

1st. PHYLLOPODA. No bivalve, shell-like covering. Extremities natatory, and in considerable numbers (from 8 to 22). (*Branchipus*, *Limnadius*, &c., &c.)

2nd. CLADOCERA. Carapace in form of a bivalve-shell. Thoracic members five pairs. (*Daphnia*, &c.)

IV.

ENTOMOSTRACA.

No *branchiæ*, nor any modification of organ apparent to supply the place of these. Eyes sessile, and commonly united into a single mass. The *Entomostraca* contain two orders, viz., the *Copepoda* and *Ostrapoda*.

1st. COPEPODA. Body divided into distinct rings, neither carapace nor valvular envelope. Thoracic and oral members in considerable numbers. (*Cyclops*, *Pontia*, &c.)

2nd. OSTRAPODA. Body without very evident annular

divisions, and entirely inclosed under a large dorsal shield having the form of a bivalve-shell. Extremities in very small number. (Cypris, &c.)

2. EDENTATA

The EDENTATA contain three orders, viz., the *Araneiformes*, the *Siphonostomata*, and the *Lernæiformes*.

1st. ARANEIFORMES. Extremities rod-like, long, adapted for walking. (Pycnogonon, Nymphon.)

2nd. SIPHONOSTOMATA. Extremities not adapted for walking; partly lamellar, partly prehensile. (Caligus, Dichelestion, &c.)

3rd. LERNÆIFORMES. Extremities rudimentary, body presenting anomalous forms. (Lernæa, &c.)

FOSSIL CRUSTACEA.

Crustacea occur in a fossil state throughout the series of fossiliferous beds. One form now extinct appears to have been among the earliest of the created beings whose remains have been preserved to us. The Trilobitic type is to be traced from the oldest fossiliferous strata to the coal-measures; and the Decapoda have been found below the chalk, in the chalk, and in some of the most recent deposits. Even the branchiæ and eyes of some of these fossil crustaceans are in a high state of preservation. The details of this part of the subject will be found under the heads treating of the families and genera noticed in this work whose organic remains have been discovered.

CRUTH, or CRWTH, a musical instrument of the violin kind, formerly much used in Wales. Sir John Hawkins says that 'it somewhat resembles a violin, twenty-two inches in length and an inch and a half in thickness. It has six strings, supported by a bridge, and is played on by a bow. . . . The bridge is not placed at right angles to the sides of this instrument, but in an oblique direction, and one of the feet passes through one of the sound holes, and rests on the inside of the back.' The four first strings are placed as in the violin, but the fifth and sixth, which are an inch longer than the others, are fixed to the upper part of the instrument in the manner of the arch-lute [LUTE], and unconnected with the finger-board. According to the same writer the notes of the Cruth were these:—

from which we are led to suppose that the strings were struck in pairs—two at a time.

The word Cruth was corrupted in pronunciation into *crowd*; hence a performer on the instrument was called a crowder. Butler, in *Hudibras*, names his fiddler *Crowdero*. (Hawkins' *Hist.*, vol. ii.)

CRUX, a southern constellation formed out of Halley's observations, by Augustin Royer, in his maps, published in 1679. It is situated close to the hinder legs and under the body of Centaurus.

CRUZ, SANTA. [SANTA CRUZ.]

CRUZ, VERA. [VERA CRUZ.]

CRYOLITE. This mineral is a fluoate of soda and alumina; it is of a white colour, or reddish, or yellowish-brown, and its streak is white. It occurs in crystalline masses, but its primary form has not been observed; its cleavage is parallel to the terminal and lateral planes of a rectangular prism. Its specific gravity is from 2.94 to 2.963. It is not so hard as fluor spar, is translucent, and by immersion in water becomes transparent. It fuses by the blow-

pipe into a transparent globule, which becomes opaque on cooling.

It is found at Arksut-fiord, in West Greenland. According to the analysis of Vauquelin it consists of—

Fluoric acid and water .	47
Soda	32
Alumina	21
	100

CRYPsirina. [TEMIA.]

CRYPT, a low-vaulted chamber, the vaulting of which is supported on columns, and the basement walls of a church or cathedral. Crypts are usually without windows, and when seen by torch-light their simple and massive architecture has a gloomy appearance. Some crypts have become the receptacle of the monuments of the dead, as at the abbey of St. Denis. Crypts are far from being common to all churches and cathedrals. There are some interesting views of crypts in Dugdale's 'Monasticon.'

CRYPTOCEPHALUS (Geoffroy), a genus of Coleopterous insects of the section Cyclica, and family Chrysomelidae. Technical characters:—antennæ filiform, nearly as long as the body; palpi with the joints nearly of equal thickness; head deeply inserted into the thorax, small and vertical; thorax nearly as broad as the elytra; body short and cylindrical.

Upwards of twenty species of this genus are found in this country; the most abundant species is *Cryptocephalus sericeus*: this little beetle is of a brilliant golden green colour, and about a quarter of an inch in length; it is found during the month of July in the flowers of the Hieracium and similar plants.

Cryptocephalus Lineola is about the same size as the last, and is found on oak trees, hazels, &c.; it is black and glossy; the elytra are red, and have an oblong dash in the middle, and the suture and outer margin black.

CRYPTOCONCHUS, a name given by some zoologists to those *Chitonidae* whose shelly plates are entirely hidden by the investing border. [CHITONS; and *Zool. Journal*, vol. v., p. 28.]

CRYPTOGAMIA, the twenty-fourth class of the Linnean system of plants. It includes all those genera the flowers of which are either altogether absent or formed upon a plan different from that of ordinary plants. Ferns, mosses, lichens, algæ, fungi, with their immediate allies, form the class, which is the same as the Acotyledons of Jussieu, and the Cellulares of De Candolle.

CRYPTONYX. [TETRAONIDÆ.]

CRYPTOPHAGUS (Herbst), a genus of Coleopterous insects of the family Engidæ. They are minute beetles, which are found in fungi and in flowers, and some of the species are common in damp cellars.

The Cryptophagi are seldom more than an eighth of an inch in length, generally of a pale brown colour, and more or less pubescent. They have the antennæ rather thick and eleven-jointed; the basal joint is thicker than the seven following, and the three apical joints form an elongated knob; the terminal joint is somewhat conical, and the two preceding joints are cup-shaped; the head is nearly triangular, inserted into the thorax as far back as the eyes; the thorax is nearly square, and the lateral margins are more or less denticulated; they usually exhibit an obtuse tooth-like process in the middle; the elytra are elongate; the sides are generally straight and parallel, or nearly so, and the apex is rounded.

About sixteen species have been found in this country. *Cryptophagus bituberculatus* is sometimes abundant in puff-balls, and probably inhabits other fungi.

CRYPTOPROCTA. [VIVERRIDÆ.]

CRYPTORHYNCHIDES (Schoenheer), a family of Coleopterous insects (section Rhynchophora), the species of which are chiefly distinguished by their possessing a groove in the chest into which the rostrum is received when at rest.

This family contains upwards of twenty genera, of which the genus *Cryptorhynchus* may be considered as the type. The characters of this genus are:—antennæ twelve-jointed, short, funiculus seven-jointed; the first joint rather longer than the rest; club oval or oblong-oval; rostrum moderate, rather arched; thorax often broader than long, narrower towards the apex, and furnished with tufts on the anterior part; elytra somewhat ovate, covering the abdomen; scu-

tellum distinct; legs moderate, femora often armed with a spine beneath.

Of this genus upwards of ninety species are known, only one of which inhabits England—*Cryptorhynchus Lapathi*. This beetle is less than half an inch in length, and of a dull brownish-black colour; the thorax is whitish at the sides, and is furnished on the upper part with five black tufts, two on the anterior part near the eyes, and three in a line a little behind these, one in the middle of the thorax, and one on each side; the elytra are brown-white at the base, and white at the apex, and are studded with numerous black tubercles.

C. Lapathi is found on willows, and is sometimes tolerably abundant in osier-beds in the south of England: when touched, like most of its tribe, it contracts its legs and falls to the ground.

CRYPTO'STOMA. [CHISMOBRANCHIATA, vol. vii. p. 94.]

CRYPTURUS. [TINAMOU.]

CRYSTALLINE LENS. [EYE.]

CRYSTALLOGRAPHY, or the doctrine of the relations of crystalline forms, is in strictness an application of solid geometry; but it is practically allied to mineralogy, and may also be regarded as a subsidiary department of that science.

Minerals occur very generally in the state of crystals, that is, in certain definite and symmetrical forms, and these are regarded as crystals whether they are transparent or opaque.

A solid figure, of the shape of a common die, used in games of chance, frequently occurs among minerals, and is then termed a *cube* or *cubic crystal*.

If the corners of this cube were to be cut off, so as to take away equal portions of the three adjacent edges, a new figure would be produced, which is said to be *derived* from the cube.

If the edges were to be all cut off, so as to produce new surfaces, making equal angles with the adjacent sides of the cube, another *derived* form would result. In these cases the cube would be deemed the *primary* form, and the derived figures *secondary* forms of the cube.

Minerals are very generally known by their primary forms: but as these are of different kinds, and as natural crystals are very generally found in secondary forms, from which the primary is to be inferred, a knowledge of the exact relations of the primary and secondary forms is requisite, to enable the mineralogist to determine the primary from the secondary, and hence to arrive at a knowledge of the mineral to which any given crystal belongs.

Our subject may therefore be considered under three heads, viz.:—

Primary forms,

Secondary forms,

The laws of derivation, or the mutual relations of the secondary and primary.

To which we propose to add some account of the nature of crystallization, and of the manner in which natural crystals may be supposed to have been produced.

We must however premise a few definitions.

What we have called the *corners* of the cube will be termed its *solid angles*, and so of the corners or points of all other figures.

A solid angle or edge cut off so as to produce a new surface, or *plane* as it is termed, is said to be *truncated*.

The series of forms resulting from each of the primary forms constitutes a peculiar *system of crystallization*; there are, consequently, as many different systems as there are different kinds of primary forms.

A *prism* is a solid figure, having any number of sides with parallel edges, and its two ends parallel.

A *right prism* is one which stands upright when placed on a table; if it overhangs the base in the direction of an edge or diagonal it is termed *oblique*, and if an oblique prism is again oblique in the direction of a second edge or diagonal it is *doubly oblique*. The bases of doubly oblique prisms are usually oblique-angled parallelograms.

The edges of the sides, and the side planes of a prism, are termed *lateral*, and those of the ends *terminal* edges and planes.

1. *Primary forms.*

These are in some degree arbitrarily assumed, as it appears from the three following figures, showing the relation between the cubes and angular octahedron.

Fig. 1 is a cube.

Fig. 2, a cube, with its solid angles truncated.

Fig. 3, an eight-sided figure or octahedron, which is produced when the solid angles are so deeply truncated as to obliterate all the faces of the cube.

Fig. 1

Fig. 2.

Fig. 3.

Now it is, mathematically speaking, indifferent whether we take the cube or the octahedron as the primary form of all the derived figures of this system of crystallization, for it may be readily perceived, from an attentive comparison of the above figures, that new planes which might be produced on the octahedron by the truncation of its solid angles, would correspond *in position* with the faces of the cube, and those which would result from the truncation of its edges would correspond *in position* with those which would result from the truncation of the edges of the cube. The cube might therefore be regarded as the secondary form of the octahedron, arising from the truncation of its six solid angles. Relations of the same nature subsist among the original and derived figures belonging to each kind of the primary forms, except the rhomboid. The reason for preferring the one or the other of these as the primary will be considered when we treat of the relations of the different forms of crystals.

We have, for reasons which we shall then state, assumed the following figures as the primary or fundamental forms of all known crystals.

The cube, fig. 1.

The square prism, in which, supposing the base of this prism to be of the same dimensions as a side of a given cube, and this and the cube to be both standing on a table, the upright edges would be longer or shorter than those of the cube.

A right rhombic prism, fig. 4.

An oblique rhombic prism, fig. 5.

A doubly-oblique prism, fig. 6.

A rhomboid or rhombohedron, fig. 7.

Fig. 4.

Fig. 5.

Fig. 6.

Fig. 7.

The cube being bounded by six equal square planes, the minerals which assume this form are not distinguishable by the figure of their crystals; but minerals which occur

under the other forms may generally be distinguished as follows:—

Those which can be referred to square prisms, by the different proportions which, in each particular case, the lateral edges bear to the terminal edges; and those which belong to the other prisms and to the rhomboid, by the angles at which their planes intersect each other. The ratios of the edges of square prisms may be determined by known algebraical formulæ from the angular measurement of some of the secondary forms, and the angles at which the planes of the other forms meet, may, in many cases, be ascertained by measurement with an instrument called a GONIOMETER, but in others they must be deduced mathematically from some of their respective secondary forms. The treatise on Crystallography in the 'Encyclopædia Metropolitana' will supply the reader with the formulæ applicable to these purposes.

These six primary forms stand in certain relations to each other, which it may not be useless to point out. If the lateral edges of the cube be supposed to be longer or shorter than the terminal edges, a square prism, as we have already seen, would be produced; if two opposite lateral edges of a square prism could be pressed towards each other, the parallelism being kept, a right rhombic prism would be formed; if this prism could be pressed in the direction of either of the diagonals of its terminal plane, so as to make the figure overhang the base in that direction, an oblique rhombic prism would be represented; and if again pressed in the direction of the other diagonal, so that it should overhang the base in both directions, a doubly-oblique prism would be formed. If we suppose a cube to be made to stand on one of its solid angles by placing the fingers on an opposite one, and if, while held in this position, the two solid angles could be pressed nearer together or drawn further apart, the altered cube would become a rhomboid.

2. Secondary forms.

These might be produced, and are most conveniently described, by supposed truncations of the solid angles or edges of any of the preceding forms; but as in nature the most minute crystals appear in the shape of secondary forms, it is to be inferred that these modifications of the primary are occasioned by some natural influence operating upon the first germ of the crystal, and continuing during the period of its increase in size.

Secondary crystals are sometimes altered from the primary only by single sets of planes replacing some of the solid angles or edges; in other cases both the solid angles and edges are replaced by planes in the same secondary crystal; and in others, several different sets of planes appear replacing the solid angles and edges of the same crystals, and producing very numerous and complicated secondary forms. Thus it occurs that the solid angles of the cube are sometimes replaced by three and sometimes by six symmetrical planes, of which several sets may occur on the same crystal, and perhaps with other planes replacing the edges. Similar changes of figure may also occur on each of the other kinds of the primary forms, thus producing the different systems of crystallization before referred to.

The number of known secondary forms belonging to each system is already very great; in one mineral, carbonate of lime, they amount to many hundreds; but thousands and tens of thousands more might occur under the operation of only a few of the laws of which we shall afterwards treat.

Among the secondary forms of crystals there are some which differ in their characters from those already described. Let us suppose two diagonal lines to be drawn through opposite angles, and crossing each other on the faces of the cube. It may be observed, by referring to *fig. 2*, that the solid angles at the extremities of all these diagonals are truncated to produce the octahedron; but it sometimes happens that the solid angles at the extremities of only one of those diagonals on one plane, and a transverse diagonal on a parallel plane, are truncated, producing a four instead of an eight-sided secondary figure; these are termed *hemi* forms, from their presenting only half the number of planes which might be expected from the symmetry of the primary crystal. These *defective* figures, as they may be termed, from their wanting the number of faces which might be expected on the crystal, are frequently troublesome to the mineralogist, and occasionally mislead him; but there is another, of a much more capricious deviation from the regularity of the simple forms, which is

still more troublesome than the preceding; these are what have been termed *hemitrope* and *twin* crystals. In twin crystals the two individuals are united in such a manner that if one of them be made to describe a half-revolution round an axis perpendicular to a plane, which is either a face of one of the crystals or which might be one in virtue of the laws of crystallography, it comes into the position of the other.

Twin crystals are produced by the union of two or more crystals according to some regular plan, so that if any number of twin crystals of the same kind of mineral should be found, they would be fashioned in the same manner. Hence these apparently capricious composite figures are subject to definite laws, and are not the results of merely accidental aggregation. There are also two other classes of irregular forms of crystals, one of which, termed by Haüy *epigene*, occurs where a crystallized mineral has undergone a chemical change without disintegration or suffering any change of figure; the form in the altered state of the mineral not being proper to the new substance, but remaining that of the original body.

The other class, termed *pseudomorphous*, appears as if they had been produced in moulds resulting from the destruction of crystals of other substances which had been inclosed or embedded in them, and which moulds being filled with some new kind of mineral, the new and intrusive matter assumes the form of the originally inclosed body, and one altogether foreign to its proper shape. Tables of the secondary forms of crystals will be found in the article 'Crystallography' already referred to, and a copious illustration of composite crystals may be seen in the 'Edinburgh Journal of Science,' vols. i. and ii.

The secondary forms of crystals are not derived from the primary by accidental and indefinite truncations of the solid angles and edges, but according to known and definite laws, so that all the possible alterations of figure which any given primary form can undergo, might be determined *à priori* if the extreme limits of the relative proportions of the edges considered to be cut off in producing new planes were known. Within well ascertained limits, however, many thousands of possible secondary form, belonging to each kind of primary, might be determined with absolute precision.

The laws according to which any secondary planes are produced are termed the laws of those planes. To illustrate the nature of these laws, let *fig. 8* represent a square

Fig. 8.

prism, whose edges *abc* are each divided into any equal number of parts, which parts are consequently proportional to the respective edges. Now a new plane, which should cut off one proportion from each of the edges *abc*, would evidently be parallel to the plane *def*; whose edges would coincide with diagonals of the primary planes. It would carry us beyond the limit to which we must restrict this paper, if we were to enter upon a geometrical consideration of these lines, and we shall therefore confine ourselves to this statement, that if on any square prism we find a set of planes truncating its solid angles, and if we assume the edges of these planes to be respectively parallel to the diagonals of the primary planes, the ratio or comparative lengths of the edges *a* and *c* may be found, and thus the distinction between prisms of different heights belonging to different minerals may be ascertained. Crystals belonging to the other primary forms may generally be distinguished, as we have already stated, by measurement of the angles at which the planes severally incline to each other. But in order to investigate the laws of their respective secondary planes, we require to know the comparative lengths of the lateral and terminal edges, which may be found by means analogous to those we have just described. The rhomboid however, whose edges, like those of the cube, are all equal, does not require this preliminary investigation, but the laws of new planes may be determined from measurement alone.

When a plane similar to that shown in *fig. 8* occurs on one solid angle of a crystal, it generally occurs on all the others, establishing what Haüy has termed the *law of symmetry*. But, as we have before stated in reference to the cube, this law is occasionally deviated from by the production of only one-half the symmetrical number of secondary planes on a square prism. This remark also applies to such other kinds of secondary planes as we now proceed to describe.

Besides the plane shown in *fig. 8*, there are *three* other kinds affecting the solid angles.

First, such as would cut off one, two, three or more portions of the edges *a* and *b*, but at the same time some other number from the edge *c*. Thus if one portion be cut from *a* and one from *b*, there will be two, three, four, or some other number cut from *c*; or if three portions were cut from *a* and three from *b*, either one, two, four, five, or some other number would be cut from *c*, so that a numerous series of planes of this nature might occur on each solid angle.

The *second* kind of planes are those which would cut off an equal number of parts from *a* and *c*, but a different number from *b*. But in this case there would be two planes on each solid angle, for if we suppose one plane to cut three parts from *a*, and three from *c*, and two from *b*, a second plane would also be produced, cutting three parts from *b* and *c*, and two from *a*, producing two planes similar to those in

Fig. 9.

Each of the series of planes of the first kind would have an edge parallel to the diagonal *de*, *fig. 8*; and each of those of the second kind would have edges parallel to the diagonals *df* and *ef* of the same figure. The planes of the *third* class also occur in pairs, and are such as would be produced by cutting off dissimilar numbers of parts from the three edges, such as two parts from *a*, three from *b*, and four from *c*, none of the edges of these new planes being parallel to any diagonal.

The secondary planes on the terminal edges may cut off any number of parts from the edges *r* and *b*, and the same or any other number from *s* and *c*. Those on the *lateral* edges, if they cut unequal portions from *a* and *o*, and *b* and *n*, will be found to occur in pairs. Single planes on the lateral edges are such as would result from cutting *a* and *o*, and *b* and *n* equally; and the secondary planes on the other primary forms are produced by laws analogous to those we have just described.

The reasons for preferring prisms to octahedrons for the primary forms may be thus briefly stated.

We have already seen that the octahedron derived from the cube might be taken as the fundamental or primary figure of that system of crystallization. An octahedron derived from the truncation of the upper and lower edges of the square prism, or of its solid angles, by planes which would intersect the terminal planes parallel to their diagonals, might be assumed as the primary form of this system; and octahedrons similarly derived from the other prisms might also be regarded as the primaries of their respective systems. And these figures have accordingly been adopted by Möhs as the fundamental forms of his system of crystallography. From the greater simplicity, however, of derivation which results from the assumption of the prisms as primary forms, and the greater mathematical facilities in determining the relations of the derived to the primary, we have been induced to retain them as the fundamental forms of our system. For the relations among these primary and their respective secondary forms are, according to our plan, dependent only upon the *proportions of the primary edges* required to be cut off to produce given secondary planes. But in taking the octahedrons as primaries, Möhs has founded the relations of these to the secondary figures upon the *relative lengths of the axes* of the derived figures, according to which view of derivation the lateral planes of the square prism would be denoted as those of an octahedron with an infinitely long axis, and the end planes as those of an octahedron with an infinitely short axis. And for all the various prisms which may

occur, octahedrons must first be found, from the infinite prolongation of whose axes the given prisms may be produced. From the complexity of this method it will probably not extend far beyond the school of its highly ingenious author.

The exact relations among primary and secondary forms may be determined mathematically, sometimes from measurement and sometimes from parallelisms between certain edges of the secondary figures. And the mathematical processes may be either those of plane trigonometry, as applied by Haüy; or spherical trigonometry, as used by other authors; or analytical geometry, as applied by Mr. Whewell, in a paper in the *Phil. Trans.* for 1825; or by referring the planes of the crystal to the surface of a sphere, and denoting their positions stereographically, as shown in a paper by Professor Miller, of Cambridge, in the *London and Edinburgh Phil. Mag.* of February, 1835.

Crystallization and the circumstances under which it takes place form an interesting subject of inquiry, not only in respect of the variety of figures under which crystals present themselves, but in relation to much more comprehensive geological investigations into the formation of the early crystalline rocks and the various embedded crystallized minerals, and into the manner in which the numerous crystalline bodies found in the metallic and other veins have been produced.

From the great length of time during which these natural processes must have been in action, the slowness with which they probably have proceeded, and the hidden recesses in which they have taken place, the progress of natural crystallization can scarcely be said to have been ever observed. For the production of saline crystals at the bottom of certain lakes, and even that of iron pyrites, which are said to have been observed in a progressive state of formation, cannot be regarded as belonging to the class of phenomena we are contemplating.

Not having therefore the operation of nature open to our inspection, our only sources of information relative to the formation of crystals are those afforded by the processes of artificial crystallization, and here until very recently our experiments were circumscribed, and our views bounded by a very few modes of operation; that of the deposit of crystals from solution in some fluid; their production while gradually cooling from a state of fusion; and their volatilization by heat or otherwise. Latterly, however, by the aid of that universal agent, electricity, new methods of producing crystals have been pursued: much of the darkness in which the subject had been previously involved has been dispelled, and there can now be little doubt that all the phenomena of crystallization are governed in a greater or less degree by electric influence.

The crystallization of salts from solution in fluids generally takes place when the solutions are sufficiently evaporated, but the degree of evaporation is very different for different substances. Some salts begin to crystallize at the surface very soon after evaporation commences, and others (for example, sugar) must be evaporated to the consistence of a thick syrup before any crystals will be formed. Hot fluids will generally dissolve more matter than cold ones, and crystals are frequently produced during the cooling of the hot solution. Some soluble substances however cannot be brought to crystallize under any circumstances hitherto tried; but on the solvent evaporating, a thick pasty matter is left, which by further evaporation becomes a hard solid mass. Camphor affords an instance of the formation of crystals by volatilization. The sides of a bottle containing this body may frequently be observed incrustated with brilliant crystals.

The slags of furnaces will frequently be found to contain crystallized matter; and the common rolls of sulphur when broken will frequently present small cavities lined with thin needle-like crystals.

The later processes to which we have referred depending upon electricity, have been suggested and put in operation chiefly by Mr. Becquerel, who has by the electrical induction of chemical action effected the crystallization of mineral bodies which are wholly insoluble in any fluid which does not subject them to immediate chemical change. At the meeting of the British Association in Bristol, some experiments of the same nature were described by Mr. Fox and Mr. Cross, who it appears had been following up Mr. Becquerel's course of experiments without being aware of the extent to which they had been carried, or of the means

employed by him to produce his results. Some account of these experiments will appear in one of the forthcoming London scientific journals.

CSABA, or TSABA, in the south-east of the county of Békes, in Hungary, one of the largest, if not the largest, village in Europe. It was built by Baron von Harruckern in 1715, and colonized with Lutheran Slovaks, who are now become identified with the native Hungarians. It is situated on the Hejo, in 46° 40' north lat., and 21° 8' east long. It contains a Protestant church and about 2000 houses. In 1819 the population amounted to 17,850; it has since increased to upwards of 20,000, of whom 16,700 are Lutherans, and 2700 Roman Catholics. The vicinity produces an inferior kind of wine, but very considerable quantities of grain, flax, and hemp; the grazing of cattle and sheep is carried on upon an extensive scale. The Körös flows near this village. In population it is inferior only to eight other places in the kingdom.

CSANAD, or TSANAD, a county of Hungary. [CHONAD.]

CSONGRA'D, a county of Hungary, nearly in the centre of that kingdom, and on each side of the Theiss. It is separated by the Marosh from the county of Toronta. Its area is about 1323 square miles; it contains 1 royal free town, Szegedin, 3 market-towns, 6 villages, and 30 extensive prædia, or privileged settlements, and has a population of 108,235 in 1825; now of about 113,000 souls, 70,060 of whom are Roman Catholics. The surface is a plain, here and there interrupted by low hills, covered with woods or vineyards; the soil is in general a black rich loam, in parts sandy or swampy. Being liable to extensive inundations, the water is not good, nor is the climate healthy. It is watered by three large rivers, the Theiss, Marosh, and Körös, besides the Kureza, Korogy, and other minor streams. The land available for cultivation is estimated at 695,390 acres, of which about 82,800 are occupied by woods, and 176,020 by pastures; the remainder is arable land, vineyards, or gardens. It is a fine grain country, particularly for barley, maize, and oats; much flax and excellent tobacco are raised; it produces an inferior sort of wine, and maintains large flocks and herds. The Csongrád oxen are esteemed the finest in the kingdom, and there are numerous establishments for breeding horses. Swine in great numbers are fed on acorns and maize; and much wax and honey are made.

CSONGRA'D, a market-town in the north-west of the county of the same name, on a neck of land formed by the confluence of the Körös and Theiss, in 46° 43' N. lat. and 20° 9' E. long. It is the county-town, is well-built, and has about 13,000 inhabitants, who live chiefly on the produce of their vineyards, rearing cattle, and trading with other parts of Hungary. The old castle is fallen into complete decay.

CTENODA'CTYLA (Dejean), a genus of Coleopterous insects, of the section Geodephaga, and subsection Truncatipennes. Technical characters:—body but slightly elongated, flattened; thorax longer than broad, truncated posteriorly; terminal joint of the palpi almost oval; three basal joints of the tarsi dilated, nearly triangular or heart-shaped; claws denticulated beneath.

Dejean in his 'Catalogue des Coléoptères' only enumerates three species of this genus, all of which are from Guiana. There are however other species known. *Ctenodactyla Chevolatii* is less than half an inch in length, of a blue-black colour above, and brown beneath: the thorax is red, and the legs and antennæ are yellowish-red.

CTENODA'CTYLUS, a genus of rodent animals of the family Arvicolidae, established by Mr. Gray.

Generic Character.—Each foot with four toes only and an obsolete clawless wart in place of the thumb; claws small and falcated; toes pectinated internally, with small bony appendages. Tail very short and hairy. Dental formula:

$$\text{Incisors } \frac{2}{2} \quad \text{Molars } \frac{3}{3} \quad \text{(Gray).}$$

Mr. Gray is of opinion that this subgenus appears to be most nearly allied to the Lemmings (*Lemmus*), with which it agrees in teeth and form, but differs from them in only having four free toes on each of the feet and a very obscure clawless wart in place of the thumb, and in the claws of all the feet being short and incurved, those of the hinder ones being covered with a tuft of rigid hair, more especially to be distinguished in the two inner toes, each of which also has a double, small, deeply pectinated, bony plate on its

inner side. The tail is very short, scarcely longer than the fur of the back, covered with long bristly hair. The cutting teeth incurved, the lower rounded in front, the upper concavely truncated. The upper grinders are probably like the lower, which are laminar and with a two-lobed crown, the anterior lobe being transverse, narrow, round on the outer, and narrow and sharp on the inner side; the hinder, lobed, larger, and rounded, the lobe of the two anterior ones being rather wider than long, and that of the last as long as it is wide. (Gray.)

The following species is recorded by the author above quoted: *Ctenodactylus Massonii*, Masson's Comb Rat.

Description.—Fur soft, silky; upper parts fulvous brown; the hair very thin, pale lead-coloured at the base, pale fulvous at the end, with very short blackish tips, especially upon the head; chin, throat, inner side of limbs and beneath whitish, with the same lead-coloured base to the hairs. Head rather small and densely hairy; muzzle very small, black; mouth rather small; cutting teeth exposed, rounded and smooth in front, white; the whiskers very long, twice as long as the head, rigid, black, with two or three slender long bristles over the eyebrows; eyes moderate, rather nearer the ears than the end of the nose; the ears rounded, externally covered with dense short fur like the body, internally rather naked, black, with a distinct helix. Limbs short; the feet covered with shortish rather adpressed hair; the fore feet short; the toes free, the two middle ones nearly equal, the inner rather shorter, and the outer shortest of all; the claws short, subequal, incurved, black, not so long as the hinder ones; the hinder feet large with naked soles; toes free, the three inner equal, the outer rather the shortest, the two inner toes with two series of four or five bony laminae placed side by side, forming a comb-like process, and covered with some very stiff bristly incurved hair; the tail very short, cylindrical, ending in a parcel of rather rigid black-tipped hairs. Size and shape about that of a half-grown guinea-pig. Length (stuffed specimen) from nose to base of tail, 9 inches; of the tail, 1 inch (the longest bristle extends beyond the tip); of the hind feet, 1½ inch; of the ears, ½ of an inch. (Gray.) Locality, Cape of Good Hope.

'I am not aware,' says Mr. Gray, speaking of the comb-like appendage, 'of the same kind of process being found on the toes of any of the Mammalia. It most nearly resembles the pectinated edge of the claws of the middle toes of the feet of the Goatsuckers and Herons: it may probably be used for the same purpose to clear their coats of intruding insects, and this idea is strengthened by the fact of the two living animals in the collection of the Zoological Society, said to come from Barbary, continually scratching themselves with their hind claws. Some of the Lemmings, to which these animals are most nearly allied, are peculiar for having a very curious conformation in the claw of the index finger of the hand.'

Mr. Gray refers to two specimens in the British Museum, one of which is marked in the hand-writing of his late uncle Dr. E. W. Gray. 'C. B. Spei Masson, 1744, appears to be a variation of No. 1,' which last Mr. Gray thinks is probably the other specimen in the British Museum, which is rather larger.

The species is named after Mr. Francis Masson, who was one of his majesty's gardeners, and published a paper in Phil. Trans., lxvi. (1775), giving an account of three journeys from Cape Town to the southern parts of Africa, undertaken for the discovery of new plants, towards the improvement of the Royal Botanical Garden at Kew.

The description of this curious animal is taken from Mr. Gray's 'Spicilegia Zoologica*,' where there is a figure of the species, and where the reader will find much original and valuable information illustrated by plates.

CTE'NOMYS. [MURIDÆ.]

CTENO'STOMA (Klug), a genus of Coleopterous insects, of the section Geodephaga, and family Cicindelidae. Distinguishing characters:—the basal joints of the anterior tarsi dilated in the male sex, the third with an obliquely elongated portion on the inner side; body narrow and long; thorax long, somewhat globular in the middle, and suddenly constricted towards the base and apex; antennæ setaceous; palpi long and distinct; mentum furnished with a tooth-like process in the anterior and emarginated part.

* 'Spicilegia Zoologica, or original Figures and short systematic Descriptions of new and unfigured Animals,' by John Edward Gray, F.G.S., &c. &c., part 1, 4to., London, Treuttel and Co., and W. Wood.

Ctenostoma macilentum (Klug), is about half an inch in length, and of a brassy-black colour; the elytra are distinctly punctured, and have a transverse yellowish farsia in the middle; the legs are yellowish

[*Ctenostoma macilentum*.]
a, denotes the natural length.

This species is from Buenos Ayres. Eight or nine other species are known, all of which inhabit South America: several are from Brazil.

Under this head may be noticed three other genera closely allied to the one just described: the genera *Therates*, *Tricondyla*, and *Colliurus*.

The species of these three genera are at once distinguished from those of *Ctenostoma*, by their having no tooth-like process in the emargination of the mentum. The principal characters of the genus *Therates* (Latreille) are as follows:—tarsi nearly the same in both sexes, the third joint shorter than the two basal joints, and notched at the extremity; fourth joint very short, and heart-shaped; internal maxillary-palpi very small, and consisting of one joint only.

The species of this genus are of an intermediate form, between *Ctenostoma* and *Cicindela*: they are shorter and broader in proportion than those of the former, and hence approach the latter; but the thorax is of that same globular form (though short) as observed in *Ctenostoma*.

Only four or five species are known, and these are from Java and Guinea: their colouring is very brilliant.

Therates labiata is of a brilliant blue colour, with violet reflections; the elytra are nearly double the width of the thorax; the labrum, femora and abdomen, are of a reddish-yellow colour.

The species of the genus *Tricondyla* (Latreille) very much resemble, in form and general appearance, those of *Ctenostoma*; but they may be distinguished by their having the joints of the tarsi nearly equal in length, the three basal joints of the anterior tarsi of the males dilated, the third being prolonged obliquely on the inner side, and the palpi being less conspicuous from their comparatively smaller size.

Of this genus three species are known: they inhabit the islands north of Australia.

The technical characters of the genus *Colliurus* are:—fourth joint of all the tarsi prolonged on the inner side in both sexes; thorax elongate, nearly cylindrical, and constricted near the base and apex; body elongate, nearly cylindrical, broader towards the posterior part; antennae short, slightly thickened towards the apex.

All the species of this genus as yet discovered (which amount to only four or five) are found in the southern parts of Asia, and in the islands north of New Holland.

Colliurus emarginata (Dejean), is about an inch in length, and of a dull blue colour; the elytra are coarsely punctured, and truncated at their apex; the legs are black, with the exception of the thighs, which are red.

CTESI'SIAS (Κτησίας), the son of Ctesiochus, was a Greek physician and historian, who flourished about the end of the fifth century B.C. He belonged to an Aselepiad house at Cnidos, but spent seventeen years of his life at the court of Artaxerxes Mnemon. (Diodor. ii. 32.) We gather from Tzetzes (Chil. i. 1, 82), that he was taken prisoner at the battle of Cynaxa (401 B.C.), and Diodorus says, that he was raised from the situation of a captive to his post of royal physician; but it appears from Xenophon and Plutarch (*Anab.* i. 8, § 27; vit. *Artaxerxes*, c. xi.), that he was one of Artaxerxes' immediate attendants at that battle, so that of course he could not have fallen into the hands of the Persians on

that occasion. It is more probable that the great estimation in which Greek physicians were held in Persia, where they had, since the time of Democedes, completely superseded the Egyptian practitioners, induced Ctesias to follow the example of some of his countrymen, and betake himself to a country where his art was so much more appreciated and so much better rewarded than in Greece. Ctesias wrote—I. Persian History, in twenty-three books, of which the first six treated of the Assyrian monarchy, and the remainder carried down the history of Persia to the year 398 B.C. (Diod. xiv. 46; and the end of the Persica in Photius.) II. Indian History, in one book. III. A Treatise on Mountains. IV. A Description of Sea-coasts. V. On the Revenues of Asia. VI. On Medicine. We have many fragments of his historical writings, especially of the Persian History, which are mainly preserved in the *Myriobiblon* of Photius: there are also fragments in Diodorus, Ælian, and other writers. Diodorus says (ii. 32), that he had access to the royal archives; but Aristotle, Plutarch, and Lucian, charge him in strong terms with inaccuracy and falsehood. The opinion of the two last-mentioned writers however is of no value. Mr. Clinton thinks that Ctesias had no intention of misrepresenting, but that his materials were not trustworthy (*Fasti Hellenici*, ii., p. 308); and an elaborate justification of his general veracity has been attempted by Bähr, in the introduction to the best edition of the remains of this author which has yet appeared. Ctesias wrote mainly in the Ionic dialect; he is much commended by Photius for the clearness and simplicity of his narrative. (*Francof. ad Mœnum*, 1824.)

CTESI'BIUS, an Alexandrian Greek who lived about B. C. 150—120, the instructor of Hero (according to Pliny), and the inventor of various hydraulic and other machines, according to Pliny, Vitruvius, Philo of Byzantium, Athenæus &c. This is all we know of Ctesibius, except that he wrote various works, which are referred to by Vitruvius, and cited (cap. 1) with those of Archimedes, where mention is made of authors on physics. A manuscript of Geodesy is said to be in the Vatican, and another entitled 'Belopoeica' in some English library (Heilbronner is authority for both, who cites Possevinus, *Bibl. Sel.*, edit. Rom., c. 8, p. 201, and the catalogue of the Cambridge library (?)). There is a life of Ctesibius by Bernardino Baldi, Aug. Vend., 1614.

Of the clepsydra we have already spoken. [CLEPSYDRA.] The remaining inventions attributed to Ctesibius are the water organ, mentioned by Pliny and Vitruvius, a pump for raising water, described by the latter, and, according to Philo of Byzantium, a machine similar in principle to the air-gun. But all these contrivances are imperfectly described, excepting only the pump, which was like what we now call a forcing-pump. The water was raised by exhaustion into a cylinder with an entering and issuing valve: it entered by means of the former, and was expelled through the latter by the descent of the piston.

CTE'SIPHON, a town of Assyria on the eastern bank of the Tigris, a little below Seleucia, and 18 or 20 miles from the present Bagdad, was the winter residence of the kings of Parthia. (Strabo, p. 743 c; Tacitus, *Ann.* vi. 42.) They preferred Ctesiphon in the winter on account of the mildness of the climate: in summer they resided at Ecbatana or in Hyrcania. The town appears to have been founded by Vardanes. (Ammianus Marcellinus, xxiii. 20.) Ctesiphon was destroyed by the emperor Severus, A.C. 198. Near this place are some remains, especially the Taik Kesra, of which a particular description is given by Ives. [BRICK WORK, p. 411.]

CTE'SIPHON, an Athenian, son of Leosthenes, of the deme Anaphlystus. He is known for a decree by which he proposed to present Demosthenes with a golden crown as a public acknowledgment of his services to the state. An accusation founded on this decree was brought against Ctesiphon by Æschines, who charged him with unconstitutional proceedings. Demosthenes replied in his celebrated oration 'on the Crown' (περί στεφάνου), and Ctesiphon was acquitted. The attack and the defence are both extant. The case was tried B. C. 330. (Demosthenes *on the Crown*, §§ 243, 266; Clinton, *Fast. Hel.*; ÆSCHINES; DEMOSTHENES.)

CUBA is the largest of the islands which constitute the Columbian Archipelago. The most eastern point, Cabo Maysi, is in 74° 11', and the most western, Cabo San Antonio, 84° 58' W. of Greenwich. Cabo de Cruz, the most southern point, is 19° 47' 16", and Cabo de Guanós, east of Matanzas, the most northern point, 23° 9' 27" N. lat. T

length of the island from Cabo Maysi to Cabo San Antonio, along the curved line, is 793 miles. It is widest near the meridian of 77° , where between Punta Maternello on the northern coast, and the mouth of the Rio de la Magdalena, near the Pico Tarquino, it is $127\frac{1}{2}$ miles across. Between Puerto Principe and the Havanna, which tract comprehends about four-fifths of the island, it is only 52 miles wide on an average. The western extremity is still narrower, the isthmus between the Havanna and the port of Batabano being only 28 miles across. The surface of Cuba alone, according to the latest calculations, is 42,212 square miles; and when the islands are added, which are inclosed within the numerous reefs which surround it, 43,412 square miles. Its extent is therefore about 7000 square miles less than that of England, not including Wales.

The coast-line of Cuba is above 2000 miles, but hardly one-third of it is accessible to vessels; the remainder is surrounded by banks, reefs and rocks. The coast from Cabo de Cruz to Cabo de Maysi is quite free from danger; and that from Cabo Maysi to Punta Maternello has only a few rocks. At Punta Maternello commence the numerous keys of the Old Bahama Channel, which extend for more than 300 miles to Punta de Icacos. In this part, or more precisely opposite the Cayo Cruz and Cayo Romano, the Old Bahama Channel is narrowest, being only 15 or 20 miles across. Between the keys and Cuba is an open sea, which may be navigated by small vessels. From Punta de Icacos to Bahia Honda, west of Havanna, the coast is again free from keys and rocks. To the west of Bahia Honda commences the series of shoals and rocks called Los Colorados, which extend to Cabo San Antonio. From the last-named cape to Punta de Piedras or Llana Punta, the high coast is free from shoals and rocks. But the keys and shoals commence again to the west of the Isla de Pinos, and extend to Cabo de Cruz, under the name of Jardinillos, Cayo Breton, Cayos de Las Doce Leguas, and Bancos de Buena Esperanza. Only the coast between Cochinos Bay and Puerto Casilda, near Trinidad, forms an exception, being free from banks and rocks. In the Bay of Xagua, about thirty miles east of the Jardinillos, a spring of fresh water is said to rise in the sea with such force, that boats cannot approach it without danger. It is visited by the manati. In the sea between the northern coast of Cuba and the Florida Reef, the Gulf Stream commences, but here its current is not strong, and sometimes hardly perceptible.

Only the south-eastern part of Cuba is mountainous, that which lies between Cabo de Cruz, Cabo Maysi, and the town of Holguin. This mountain group is called Sierra or Montañas del Cobre (Snake Mountains), and probably in its highest parts rises more than 7200 feet above the sea. On the southern coast the Pico Tarquino rises to a considerable height, which however has not yet been determined. From this group a chain of hills runs in a W.N.W. direction, between Puerto Principe and Villa Clara, approaching nearer to the southern, but afterwards more to the northern shores. These hills do not attain a great elevation. To the north-west of Trinidad stand the Lomas de San Juan, which terminate in peaks and needles, and rise to about 1800 feet above the sea. The elevation of the hills seems to decrease as we advance westward. To the west of the meridian of Matanzas there is only one summit that attains 1200 feet. In this part the island resembles the environs of London, its surface being slightly undulating, and rising in general only to 250 or 350 feet above the sea. Along the southern coast large tracts of low country occur. The whole space between Batabano and Xagua is nothing but a low swamp, which extends three or four miles inland.

There are no large rivers in Cuba. Some are navigable a few miles inland for small boats; others are used for irrigating the adjacent fields.

The climate of the Havanna differs considerably from that of Kingston in Jamaica, though the difference of position does not exceed five degrees. This difference however principally occurs in the cold season, when the thermometer at the Havanna nearly every year descends to 60° , and sometimes to 55° , whilst at Kingston it is never seen below 69° or 68° . The mean annual heat at the Havanna is 77° , that of the hottest month (July) 84° , and that of the coldest 70° : the thermometer rarely rises to 94° , or sinks to 55° . In the interior of the island however, thin ice is formed after the long prevalence of northerly winds, at places about 300 feet above the sea. But Cuba partakes, in some measure, of the climate of the temperate zone, which is proved

by the sudden changes of the temperature, in which it, in some degree, resembles the United States. Humboldt mentions a change of 15° in the course of three hours. No snow is ever known to fall, either on the Lomas de San Juan, or on the Sierra del Cobre. Hail storms are rare; they occur only once in fifteen or twenty years, and always with south-south-westerly winds.

Hurricanes are less frequent in Cuba than in Jamaica and the other Antilles. Sometimes none occur for six or eight years. They vent their fury more on the sea than on the land, and happen, as in Jamaica, more frequently on the southern than on the northern coast. Humboldt states that they take place later in the year in Cuba than in the islands farther to the east and south. In the latter they are most frequent in August; in Cuba they occur mostly in October, never in July, but sometimes in August and September. The same writer observes, that the extremities of the long chain of islands called the Antilles are less subject to these dreadful storms than those in the middle, Tobago and Trinidad being entirely free from them, and Cuba not often experiencing their ravages. But, on the other hand, Cuba is exposed to the boisterous north winds (los nortes), which blow particularly during the cold months.

The division of rainy and dry seasons is not applicable to Cuba. No month of the year is free from rain. It seems, however, that the greatest quantity falls during May, June and July. In 1829 the quantity of rain was 48 inches, of which nearly 24 inches fell in these three months. Earthquakes frequently occur.

The aborigines who inhabited Cuba in the time of Columbus, were annihilated before the year 1560, though the Spaniards settled in this island only in 1511. The present population consists of whites, negroes, and mixed races. It amounted in 1827 to

Free people	443,620
namely, whites	337,126
coloured	106,494
Slaves	286,042
	729,662

According to a more modern census (1831), it has risen to nearly 830,000 individuals. In 1775 the number was only 170,000. This population, however, is very unequally distributed over the island, nearly four-fifths of which are very thinly inhabited, especially the southern coast, except the country between Xagua and Trinidad, and that which is east of Cabo de Cruz: there are also large tracts in the interior which are only used as pasture-ground, and contain hardly more than two individuals to a square mile. The most populous portion is between the lines from Bahia Honda to Batabano, and hence to Matanzas, where nearly the half of the whole population is concentrated, and where perhaps there are 70 or 80 persons to each square mile. The following table shows the relative population of the three intendencias, and the proportion between the whites, free coloured people, and slaves.

	Square Miles.	Population in 1827.	On a sq. m.	Of every Hundred of Inhabitants.		
				Whites	Free Blacks.	Slaves.
Western Int.	10,303	408,537	40	40	11	49
Central Int.	17,104	164,497	9	60	15	25
Eastern Int.	14,805	131,453	9	36	27	37
Total	42,212	704,487	17	46	18	37

The cerealia of Europe are not cultivated in any part of Cuba, and a great quantity of flour is consequently imported from the United States for the consumption of the white inhabitants. The slaves and people of colour live principally on mandioca, yams, bananas, and maize or Indian corn, with potatoes, sweet potatoes, &c. The objects raised for consumption and exportation are sugar, coffee, tobacco, cotton, cocoa, and indigo; but the three last on a very small scale. As immense tracts are not cultivated, but only used as pasture-ground, the number of cattle is very great, and hides form an article of exportation, but dry meat (tasajo) is imported from Venezuela. The surface under cultivation is supposed not to exceed one-seventeenth: the unculti-

vated part contains large prairies or savannas, on which the cattle pasture, but the greatest part is overgrown with large forest-trees, some of which supply excellent timber for ship-building. Gold and copper have been found in the Sierra del Cobre.

I. The *Western Intendencia* contained, in 1827, 449 plantations of sugar, 1207 of coffee, and 400,000 heads of horned cattle. It contains, besides the capital, Havanna, the towns of Guanabacoa on the other side of the Cay on which Havanna is built, with 9100 inhabitants (in 1827), and San Carlos de Matanzas, which, in 1827, contained 11,300 inhabitants. To this intendencia belongs the isla de los Pinos, more than 900 square miles in extent, with a mountain on it rising to more than 3000 feet high. It contains from 200 to 300 inhabitants; and fine forests, in which much mahogany is cut.

II. The *Central Intendencia* contained, in 1827, 246 plantations of sugar, 135 of coffee, and 605,000 head of cattle. It is the most fertile portion of the island, especially the country round the town of Santo Espiritu, and has greatly increased in population and agriculture since the ports have been opened to foreign commerce. The most populous places are inland, namely, Santa Clara, with 8500 inhabitants (in 1827), and Santo Espiritu, with 10,800. The capital Santa Maria de Puerto Principe is also at some distance from the shore, but carries on a considerable commerce by means of its port Nuevitas. It contained, in 1827, 49,000 inhabitants: it is the seat of the supreme court of justice for all the Spanish colonies in America. Besides, there is on the northern coast the harbour of San Juan de los Remedios, with 5200 inhabitants (in 1827), and on the southern, Trinidad de Cuba, with 12,500, and Fernandina de Xagua.

III. The *Eastern Intendencia* contained, in 1827, 305 plantations of sugar, 725 of coffee, and 105,000 head of cattle. Santiago de Cuba, the antient capital, has a good harbour and 26,000 inhabitants. There are also three other harbours, which are much frequented by vessels, Manzanillo, north-east of the Cabo de Cruz, Baracoa, near Cabo

Maysi, and Gibara, farther west. The last is the port of Holguin, a small town in the interior.

Commerce.—In few countries has commerce increased so rapidly as in Cuba. About 1780, the exportation of its own produce amounted to little more than two millions of Spanish dollars in value: in the three years from 1831 to 1833, the average value of all goods exported had risen to between 13 and 14 millions, though in some parts a considerable smuggling trade was carried on. This increase has of late been considerable, since (in 1816) the vessels of all nations have been admitted into the ports. Though Havanna is by far the most important trading town, other places carry on a considerable commerce, as the following table shows.

PORTS.	TONNAGE OF VESSELS.			
	Inwards.		Outwards.	
	1828.	1829.	1828.	1829.
Havanna	169,889	153,834	136,259	144,487
Santiago de Cuba . . .	33,376	31,734	32,209	24,876
Puerto Principe . . .	4,285	5,297	3,479	5,136
Matanzas	35,523	31,331	30,151	29,770
Trinidad	18,291	18,885	17,616	17,009
Barawa	1,267	1,431	917	1,100
Gibara	1,869	2,139	1,272	2,022
Xagua	2,454	1,426	1,929	1,468
Manzanillo	8,112	3,194	5,996	2,882
	277,066	249,253	229,830	228,750

The chief articles of importation are provisions, particularly flour, rice and maize, butter, cheese, candles, and tallow, tasajo and hams, and salted fish and cod. Brandy and the wines of Spain, France, Portugal, and Germany also form a considerable branch of importation. As Cuba has no manufactures, cotton stuffs, woollen goods, linens, hardwares, and silk stuffs are imported to a large amount.

The course and amount, stated in English money, of the trade of Cuba, in the three years which ended with 1833, will be seen from the following table.

	1831.		1832.		1833.	
	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.
	£.	£.	£.	£.	£.	£.
Spain	1,045,185	642,583	911,086	606,362	836,243	565,317
Former Spanish Colonies . . .	380,394	151,528	662,207	206,958	385,183	269,524
Hanse Towns	354,649	396,013	387,251	438,432	196,325	313,356
United States of America . . .	977,147	816,998	738,319	647,506	929,481	913,934
France	139,500	91,987	167,880	75,208	193,327	110,691
England	305,403	326,608	263,085	437,851	338,577	189,787
Italy	4,719	91,011	7,425	77,317	10,755	47,640
Netherlands	22,194	59,877	61,331	101,310	42,417	55,681
Portugal	5,817	1,376	10,983	4,677	9,401	4,548
Russia		99,777		223,433	10,971	207,335
Sweden and Denmark	4,298	8,609	7,050	12,879	7,138	15,867
Turkey		5,120		255		13,833
£.	3,239,306	2,091,487	3,215,617	2,832,278	2,959,818	2,707,513

The imports in 1833 consisted of,—

Grain and flour, salted meat and fish, butter and cheese . . .	£. 1,328,586
Wine, spirits, beer, and oil	329,202
Spices and dried fruits	47,038
Metals and hard wares	177,484
Cotton, linen, woollen, and silk goods	903,534

The remaining value being made up of timber, glass, earthenware, cordage, and various other less important articles.

The quantities exported, during the three years above-mentioned, of various articles, the produce of the island, were as under—

	1831.	1832.	1833.
Sugar Cwt.	1,592,272	1,692,726	1,701,909
Rum Pipes	3,838	3,429	3,227
Molasses	83,001	100,178	95,768
Coffee Cwt.	475,576	457,341	572,848
Wax	6,663	6,741	9,271
Leaf Tobacco lbs.	2,936,350	1,910,750	2,311,875
Cigars	2,285,975	11,203,075	15,442,825
Cotton	685,900	736,950	551,800
Cocoa	120,425	36,250	99,250
Mahogany Feet	46,707	58,844	40,411
Cedar	25,932	25,833	29,367
Hides Number	16,893	16,317	28,917
Preserves Cwt.	679	524	469
Fruit Value in £.	6,170	5,468	3,078
Honey Pipes	1,063	2,003	2,134
Horses and Mules Number	1,306	1,079	807
Other Produce Value in £.	9,137	9,169	9,978

The number of vessels and their tonnage, belonging to different countries, which entered the port of Havanna in the same three years, were:—

	1831.		1832.		1833.	
	Ships.	Tons.	Ships.	Tons.	Ships.	Tons.
Spanish	334	41,758	325	38,637	379	46,247
American	496	85,105	489	84,958	509	91,625
Hanse Towns	25	4,226	34	6,344	26	4,500
Danish	8	1,078	12	2,313	10	1,729
French	19	3,975	18	4,067	48	10,163

Sardinian	4	763	1	222	6	939
Swedish	1	280	1	280	6	1,061
Hanoverian			1	256	2	366
Tuscan			1	194		
Mecklenburgh					1	159
Russian					1	176
Total	953	145,092	982	155,362	1,048	168,293

The English have not so large a share in the commerce of Cuba as in that of some other commercial countries, which may be attributed to their not admitting the productions of Cuba into their ports on the same terms as those of their own colonies, and to their not being able to satisfy the demand of the island for provisions. The Americans have obtained the greatest share of this commerce, being able to supply provisions in abundance, furnishing a ready market for all the exports of Cuba, and having also the advantage of being near Spain, being now deprived of

all her colonies on the continent of America, endeavours to turn to advantage her possession of Cuba, to which she sends her wines, oil, and fruits. England, with its numerous manufactured goods and the productions of the East Indies, comes next. England takes in return tobacco, coffee, and sugar. The Hanseatic towns of Germany also have come in for a share of the trade, finding no place more advantageous for exchanging their manufactured goods (linens, paper, glass, &c.), for sugar, coffee, and tobacco. France sends great quantities of wines and some manufactured goods; and Italy oil, olives, and fruits.

The internal traffic is much impeded by the badness of the roads, which for a part of the year are impassable; but the coasting-trade is active, four thousand small vessels being used to bring the produce of the neighbourhood to the Havanna alone.

The political importance of Cuba does not rest on its extent and productions alone, but principally on its position with respect to the common routes of navigation. This route is marked out by the trade-winds and the Gulf Stream. Vessels returning to Europe from Jamaica, or the coast of South America, by sailing directly eastward, have to contend against the united force of winds and current, and are scarcely able to make either the Windward or Mona Passages, which are situated respectively at the western and eastern extremities of the island of Hayti. They are therefore under the necessity of doubling Cabo San Antonio and proceeding to Europe by the Gulf Stream. Thus the possession of Cuba gives an absolute control over the trade between Europe and all countries lying about the Caribbee Sea and the Gulf of Mexico, and consequently a great portion of the United States of America. The maritime powers, at present, seem to have come to a tacit agreement to leave Spain in the possession of Cuba, because, being the least powerful of them all, there seem to be no apprehensions of any attempts on her part to interrupt the free navigation of these seas.

Cuba was discovered by Columbus on his first voyage in 1493; in 1511 the Spaniards formed the first settlement: since that time the island has remained in their possession. In 1762 the English took the Havanna, but it was restored to Spain by the peace of 1763.

(Humboldt; *Present State of Columbia by an Officer; Map of the Society for the Diffusion of Useful Knowledge*; see also *Breve Idea de la Administracion del Comercio y de las Rentas y Gastos de la Isla de Cuba durante los Annos de 1826 á 1834*, par D. Ramon de la Sagra, Paris, 1836.)

CUBE (κύβος), a solid figure contained by six equal squares; a box of equal length, breadth, and depth.

Owing to its being the most simple of solids, the cube is the measuring unit of solid content, as the square is that of superficial content, or area. Whatever the unit of length may be, the unit of solidity is the cube which is a unit every way: thus we have the cubic inch, the cubic foot, &c.

Cubes of different sides are to one another as the algebraical third powers of the number of units in their sides: thus cubes which are as 7 to 10 in their sides are as $7 \times 7 \times 7$ to $10 \times 10 \times 10$ in their contents. Hence the algebraical third powers are called cubes: thus $a \times a \times a$ is called the cube of a . [NOTATION]. If the side of a cube contain a units, the content is $a \times a \times a$ cubical units of the same kind.

The cube has no remarkable properties, for our eyes are so used to the figure, that its properties seem self-evident.

Its internal diagonals are found by multiplying the number of units in the side by $\sqrt{3}$, or (very nearly) by adding one half and one half of one half, and subtracting one per cent. of the result, and if still farther accuracy be required, 5 for every 10,000 units:—

2) 10000	subtract 5 presently.
2) 5000	
2500	
17500	
175	
17325	
5	
17320	feet in the diagonal
which is about six inches too small.	

For the celebrated historical problem connected with this article, see DUPLICATION OF THE CUBE.

CUBEBS. [PIPER.]

CUBIT, a measure of length in use among the antients, and more especially among the Jews. The Hebrews called it *אמה* (*amma*), as the mother of other measures; the Greeks *Πήχυς* (*péchus*); the Romans *Cubitus*, a word apparently formed from the verb 'cubo,' to bend for the purpose of lying down. The cubit was originally the distance from the joint or bending of the elbow to the extremity of the middle finger. Bishop Cumberland and Pelletier fix the Hebrew cubit at twenty-one inches; but it is more usually considered as a foot and a half.

The best authorities assert that there were two cubits in use among the Hebrews; one sacred, the other common. In Deuteronomy, chap. iii. v. 11, the bed of Og is said to be nine cubits long and four broad, *after the cubit of a man*. In Ezekiel, chap. xl. v. 5 and xlii. 13, we find the cubit for measuring the temple was *a cubit and a hand-breadth*; whence it appears that the larger cubit was longer than the common one by a hand-breadth, or three inches. Thus we may reconcile the two lengths of eighteen and twenty-one inches already specified. Calmet, however, is persuaded, that from the Exodus to the Babylonish captivity, there was but one cubit in use among the Hebrews, and that it was the Egyptian cubit. He says it is only *after* the captivity that Scripture notices two sorts of measures, to distinguish the old Hebrew cubit from that of Babylon, which the captives used during their abode in that city. On this, he adds, is grounded the precaution of Ezekiel, in observing that the cubit he is speaking of is the true old cubit, larger by a hand's breadth than the common cubit. Among the Greeks the cubit (*péchus*) was twenty-four fingers (*δάκτυλοι*), measured as already explained. See Herodotus, ii. 175. (Arbutnot, *Tables of Coins, Weights, &c.*, and Calmet's *Dict. of the Holy Bible*, in voce.)

CUCKFIELD. [SUSSEX.]

CUCKOO. [CUCULIDÆ; CUCULINÆ.]

CUCULIDÆ (Cuckoos, Cuckoo-tribe), a family of scansorial birds, placed by Cuvier and Lesson next to the wry-necks, *Yunx*, and by Mr. Vigors in the aberrant group of his *Scansores*, between the *Certhiidae* and the *Rhamphastidae*. This aberrant group he characterizes as consisting of birds which have either three anterior toes and one posterior scansorial one, or zygodactyle but not retractile toes. M. Lesson arranges the following genera; *Cuculus*, *Coccyzus*, *Saurothera*, *Centropus*, *Leptosomus*, *Eudynamis*, *Indicator*, and *Monasa* under the family, whilst he places *Phænicophaus*, *Scythrops*, and *Crotophaga* under his succeeding family, *Les Hétéroramphes*. The *Cuculidæ* seem to have presented a good deal of difficulty to ornithologists. 'Neither do I wish,' observes Mr. Vigors in his paper on the natural affinities that connect the orders and families of birds, 'to dwell with any particularity on the succeeding family of *Cuculidæ*, the various and extensive genera of which are as yet but little understood as far as regards their natural affinities. The Linnean genus, *Cuculus*, indeed, as at present constituted, forms an extremely artificial group. There is much to be done with respect to these birds, and they would form an interesting subject for the researches of an ornithologist who might have leisure and opportunity to describe their living, manners, and economy. I shall only now observe, with respect to external character, that some genera of the family are associated with the true *Cuculus* by their curved and slender bill; others like *Indicator*, Vieill., have a shorter and stronger bill; while *Saurothera*, Vieill., by its serrated bill, evinces an approaching conformity to the *Ramphastidae*, and a considerable number, such as *Centropus*, Ill., *Phænicophaus*, Vieill., and *Crotophaga*, Linn., indicate the same affinity by the gradual increase of the bill in length and size. The last-mentioned genus, it may also be added, bears a relation, through the medium of *Scythrops*, to the *Hornbills*; some species of that family, and one more particularly lately discovered (*Buceros Leadbeateri*) 'in the interior of Africa, possessing, though with gigantic dimensions, the exact bill of the Ani.' [CROTOPHAGA.]

The examination here suggested by Mr. Vigors has been undertaken by Mr. Swainson, and we find in the third and fifth parts of the 'Magazine of Zoology and Botany,' two memoirs by the last-named zoologist 'on the natural history and relations of the family of cuculidæ or cuckoos,

with a view to determine the series of their variation.* The *Cuculidæ* are placed by Mr. Swainson also between the *Certhiæ* and *Ramphastidæ*, and these three families constitute what he terms his third and aberrant circle of the scansores. The following is his definition of the family character. Feet not strictly scansorial, very short, nostrils naked, tail covers remarkably long; and he separates the group into the following subfamilies: *Cuculinae*, *Coccyzinae*, *Saurotherinae*, *Opisthocominae*, *Indicatorinae*. Of the first subfamily *Cuculus*, Linn., is the type; of the second *Coccyzus*, Vieill.; of the third *Saurothera*, Vieill.; of the fourth *Opisthocomus*, Hoff.; and of the fifth *Indicator*, Sparrm.

Habits, &c.—The following account bears the stamp of actual observation, and we therefore select it. 'So faintly is the scansorial structure indicated in these birds,' says Mr. Swainson in his memoirs above alluded to, 'that but for their natural habits, joined to the position of their toes, we should not suspect they were so intimately connected with the more typical groups of the tribe as they undoubtedly are. They neither use their bill for climbing, like the parrots, or for making holes in trees, like the woodpeckers, neither can they mount the perpendicular stems, like the certhiæ or creepers; and yet they decidedly climb, although in a manner peculiar to themselves. Having frequently seen different species of the Brazilian cuckoos (forming part of the genus *Coccyzus*) in their native forests, I may safely affirm that they climb in all other directions than that of the perpendicular. Their flight is so feeble, from the extreme shortness of their wings, that it is evidently performed with difficulty, and it is never exercised but to convey them from one tree to another, and these flights in the thickly-wooded tracts of tropical America are of course very short: they alight upon the highest boughs, and immediately begin to explore the horizontal and slanting ramifications with the greatest assiduity, threading the most tangled mazes and leaving none unexamined. All soft insects inhabiting such situations laying (lying?) in their route become their prey, and the quantities that are thus destroyed must be very great. In passing from one bough to another they simply hop, without using their wings, and their motions are so quick, that an unpractised observer, even if placed immediately beneath the tree, would soon lose sight of the bird. The Brazilian hunters give to their cuckoos the general name of *Cat's-tail*; nor is the epithet inappropriate, for their long hanging tails, no less than their mode of climbing the branches, give them some distant resemblance to that quadruped. I have no doubt that the great length of tail possessed by nearly all the cuckoos is given to them as a sort of balance, just as a rope-dancer, with such an instrument in his hands, preserves his footing when otherwise he would assuredly fall. Remote therefore as the cuckoos unquestionably are from the typical *Scansores*, we yet find the functions of the tail contributing to that office, although in a very different mode to that which it performs among the woodpeckers, the parrots, and the creepers. The structure of the feet, as before observed, is the only circumstance which would lead an ornithologist to place these birds among the climbers, supposing he was entirely unacquainted with their natural history properly so called, or with their close affinity to the more perfect *Scansores*. The toes indeed are placed in pairs; that is, two directed forward and two apparently backward; but a closer inspection will show that the latter are not strictly posterior, and that they differ so very materially from those of the *Picidæ* (the pre-eminently typical family of the climbers), as clearly to indicate a different use. The organization of the external posterior toe of all the woodpeckers, parrots, and toucans, renders it incapable of being brought forward, even in the slightest degree; whereas in the cuckoos this toe can be made to form a right angle with that which is next it in front, from which circumstance it has been termed *versatile*: this term however is not strictly correct, inasmuch as the toe cannot be brought more than half way forward, although it can be placed entirely backward. Now this form, which is obviously the least developed state of the scansorial structure, accords exactly with the rank of the family, which is that of the most aberrant group in the circle, and farthest removed from the type. The cuckoos in fact are half-perching half-climbing birds, not only in their feet, but, as we have seen, in their manners. No one, from seeing them alive, would suppose they were truly scansorial birds; and yet it

is highly probable that this singular power of varying the position of one of their toes, gives them that quickness of motion and firmness of holding which accompanies the habit just mentioned.'

'There is another circumstance in the history of this family of birds, which, with one solitary exception, is altogether peculiar, as they contain the only parasitic birds yet known. This term indeed has been applied, I think improperly, to other genera, which, like the frigate pelicans, the jagers, and some of the eagles, rob other birds of their food; but this is a mere act of thieving, for all these feathered robbers can, and do, habitually depend just as much upon their own industry in procuring food. But with the typical cuckoos the case is far different, for by depositing their eggs in the nests of other birds, to whom they leave the care of hatching their young and feeding them afterwards, they become as truly parasitic as any of the *Acari* or *Pediculi*; they fasten themselves, as it were, on the living animal, whose animal heat brings their young into life, whose food they alone live upon, and whose death would cause theirs during the period of infancy. Such only is a parasitic animal, and such only, among birds, belong to the typical cuckoos and their representative, the *Molothrus pecoris*.* [CUCULINÆ, MOLOTHRUS.]

Geographical Distribution and Food.—Warm and temperate climates are the chosen haunts of the cuckoos. The European species—there are but two—never show themselves in our quarter of the globe, except in the warm weather, quitting it upon the first approaches of a colder temperature. 'So congenial is warmth to their nature,' says Mr. Swainson in the memoirs last quoted, 'that even the mild temperature of an Italian winter is not sufficient to retard their return to the sultry groves of Northern Africa. There is a fact regarding their structure, which appears connected with this susceptibility of cold, and which I believe has not hitherto been noticed. All the cuckoos, both of the old and the new world, which I have had the opportunity of dissecting, are remarkable for the thinness and delicacy of their skins, so much so indeed as to render their preservation in an entire state extremely difficult to inexperienced hands. Every one who has skinned the common British species must doubtless have observed this. On the other hand, as if to compensate for the delicacy of the cuticle, the feathers, more especially upon the back and rump, are unusually thick-set and compact.'

Tropical countries, and those which approach the equator, afford the greatest number of species.

The food of the cuckoos, as might be expected from this geographical distribution, consists principally of soft fruits and soft insects, especially the latter, and more particularly when they are in the larva state.

CUCULINÆ, Mr. Swainson's name for that subfamily of the *CUCULIDÆ*, which consists of the genuine Cuckoos.

Character of the subfamily.—Bill wider at the base than it is high, rather suddenly contracted behind the nostrils and becoming compressed; upper mandible slightly sinuous at the tip, so as to assume the form of the dentirostral notch. *Wings* considerably long, nearly reaching to two-thirds the length of the tail, and so far pointed as to diminish rapidly in length beyond the fourth quill. *Feet* remarkably short; tarsus thickly clothed with feathers, for nearly half its length, not longer than the hallux or true hind toe. Upper cover feathers of the tail thick set, narrow, generally pointed, and comparatively elongated, and in rigidity only comparable to those of the *Ceblepyrinae*, the corresponding type in the *Laniadæ*. (Swainson, *Mag. of Zoology and Botany*.)

'Popular interest,' adds Mr. Swainson, 'has been so much confined to the parasitic habits of the cuckoo, that upon many other points of its economy we are still in comparative ignorance. Hence it is, that we cannot trace, so fully as could be wished, the influence which the structure just described exercises upon the habits and manners of such birds as possess it. We know, however, that all the genuine cuckoos fly with strength and rapidity. Most of them, in fact, are migratory birds. . . . The form of the nostrils in the typical cuckoos is very peculiar, and I believe that future observations will shew this structure to be intimately connected with their parasitic habits. The nests of those species in which the cuckoo deposits its eggs, we all know, are built in the thickest and most central part of trees and bushes, to discover which, superior powers of smell have

been given to the Toucans (which feed upon the eggs or young), and, in a less degree, are probably conferred upon the cuckoos, to facilitate their search after a foster parent for their young. How far this idea may be correct, future observations will determine. Certain however it is, that this peculiar-shaped nostril is restricted to such cuckoos as are parasitic, for the whole of the *Coccyzinae* have the aperture of a lengthened oval shape, or in the form of a slit, and all we know of these birds sanctions the idea that they are not parasitic. The shortness of the feet, in the typical cuckoos, is another important distinction, and leads to the belief that these members are much less used than those of the *Coccyzinae*, whose habits we have already mentioned when alluding to the cuckoos of South America, all of which are excluded from the group now under consideration.

Genera. Cuculus.

Bill broad at the base, compressed beyond, the upper mandible obsoletely notched; *nostrils* circular, with a tumid margin; *wings* long, pointed, the third quill longest, the second and fourth of equal length; *feet* slender, very short, *tarsi* feathered posteriorly almost to the toes; *rump* and *upper tail-coverts* long, thick-set, and rigid. Inhabits the old world; parasitic. (Swainson). Type, *Cuculus canorus*.

Description.—Male. Length about fourteen inches, weight about four ounces and a half. Bill black, yellowish at the base of the upper mandible; inside of mouth red. Irides yellow. Head, and whole upper part of the bird, dark ash-colour. Throat, under side of the neck, and upper part of breast pale ash, the latter sometimes inclining to rufous brown; lower part of breast and belly white, with transverse undulating black lines. Quills dusky, inner webs barred with white oval spots. Tail-feathers ten, of unequal length; two middle ones black, dashed with ash and tipped with white, the rest black with white spots on each side of the shaft. The lateral feathers in some have white spots only on the interior webs, but all are tipped with white.

Female, rather less than male, and differing from him generally in the neck and breast being of a tawnyish brown, barred with dusky, and the coverts of the wings marked with light ferruginous spots. Tail-feathers and quills much like those of the male, but the edges of the spots incline to reddish brown. Legs in both sexes short and yellow. Outer tail-feather and first quill remarkably short.

Young.—So distinct in its plumage from the adult that it has been described as a distinct species (*Cuculus rufus*, Bris.). It is supposed not to throw off its nestling feathers till the second year's moulting, for it is stated in Montagu's Dictionary (last edit.), that in three specimens killed the same season (two males and a female), the thirteenth and three succeeding quill feathers, and the three greater coverts impending them, are barred with brown and ferruginous. In the first year the irides are greyish; the whole upper plumage is a mixture of dusky black and ferruginous, in transverse bars, except the forehead and a patch on the back of the head, which in this specimen described in Montagu was white, and the tips of the scapulars pale; the feathers of the whole under parts sullied white with distant transverse bars of dusky black. In general each feather is barred twice or thrice. The sides of the neck and breast are tinged with rufous; lateral tail-feathers and inner webs of the quills more or less barred with white. Tail coverts, which, as well as the feathers on the rump, are unusually long, dashed with cinereous and slightly tipped with white.

This well known bird is the *κόκκυξ* of the Greeks; *Cuculus* and *Coccyx* of the Latins; *Cucculo*, *Cucco*, *Cuco*, *Cucho*, *Cuccù* of the modern Italians; *Cocou*, *Coucou*, *Coqu*, of the French; *Kukuk* and *Kuckuck* of the Germans; *Gjok* of the Fauna Suecica; *Gjoeg* of the Danes; *Gouk* of the Norwegians; *Cog* of the antient British; *Gowk* and *Cuckoo* of the modern British.

Habits.—The common cuckoo arrives in this country early in spring. In White's 'Naturalist's Calendar,' the cuckoo is noted as first heard April 7—26, and in Markwick's, April 15, May 3, last heard June 28. By the first of July it has almost always taken its departure, but it is sometimes later. Mr. Swainson in his memoir on the *Cuculidae* says, 'The common species comes to us every spring, from northern Africa or Asia Minor, and returns in Autumn. This we know from personal observation; for vast numbers arrive in the spring in Sicily and Naples, in company with the

bee-eaters, orioles, hoopoes, and other migratory birds; but after remaining a short time, they appear to direct their flight northward, from whence they return in August and September.' Speaking of the *food*, the same author observes, 'The English cuckoo, no doubt, searches for its food among foliage, but its nature is so shy, that we have never been fortunate enough to witness its mode of feeding.' Montagu, however, one of the best authorities we can cite, says, that its principal food consists of caterpillars, so that it not only possesses the general cast of colours, and much of the structure of its prototypes, the *Ceblepyrinæ*, but actually feeds on the same description of insects.' The Editor of the Magazine of Zoology and Botany, adds, 'In an open and muirland district where the cuckoo is very common, we have always found, during May and June, that their stomachs were filled with the remains of caterpillars which fed on the various plants frequent in such localities. Among them those of the *Lasiocampæ* formed a great proportion, and hairy species seem to be preferred.' White in his 'History of Selborne,' thus writes: 'In July, I saw several cuckoos skimming over a large pond; and found, after some observation, that they were feeding on the *libellulæ*, or *dragon-flies*; some of which they caught as they settled on the weeds, and some as they were on the wing.' The following narrative from the last edition of Montagu's Dictionary will throw some light on this part of the subject: 'A young cuckoo, brought to Colonel Montagu in the month of July, just as it could fly, was, by great care, kept alive till the fourteenth of December. It had, during that time, two or three attacks of dysentery, from which it recovered by having chalk and ginger given to it; and during the time it lived no change was observed to have taken place in its plumage. For two months after this bird was caught, it never attempted to feed itself by picking; and even to the last moment seemed to prefer being fed by the hand of its mistress, rather than have the trouble of picking up its food, of which it was extremely choice. Nothing appeared to be acceptable as a substitute for insects except raw beef. Flies it would eagerly devour; but its most delicious morsel was any species of hairy caterpillar; these it seized with avidity, shook them to death, and softened by passing several times through the bill, till they were perfectly pliant, when it would swallow whole the largest of the caterpillars of the egger* or drinker† moths. Of strangers it was extremely fearful, fluttering in its cage to avoid their attentions; but it would quietly suffer itself to be handled and caressed by a young lady who had been its kind benefactress, appearing to like the warmth of her hand to its feet.'

It is the habit of the cuckoo in depositing her egg in the nest of another bird, that has made it so much an object of curiosity. Many strange stories were formerly rife on this custom, which can hardly be called abandonment, as the nest of a bird that feeds its young with insects is always selected. Among others, the hedge-sparrow, the reed-sparrow, the tit-lark, the water-wagtail, the yellow-hammer, &c., have been recorded as the birds to whom the egg has been committed, but the first seems to be most frequently chosen. White saw one hatched in the nest of the tit-lark. The nests of the green-bird, the linnet, the white-throat, and even of the wren have been mentioned as the places of deposit. Dr. Jenner's celebrated paper in the Philosophical Transactions threw great light on this subject, and many other observers have corroborated in general that author's remarks. Some indeed, and among them Dr. Fleming, have declared that in some cases the cuckoo constructs its own nest, but there can be little doubt that there is no foundation for this assertion, and as little that the nests and young supposed to be those of the cuckoo on such occasions were those of the goatsucker. Whether the bird actually deposits the egg from her body while sitting on the nest has been doubted, and if the case of the deposit of one in a wren's nest be a fact, it is almost conclusive that she does not so deposit it in all cases, for the aperture of the wren's nest is in the side, and not more than big enough to admit the wren. On this part of the subject, and indeed on every part of it, the reader will find much valuable information in the last edition of Montagu's Dictionary. He should also refer to the paper of Dr. Jenner above alluded to, and to that of Mr. Blackwall, in the fourth volume of the Zoological Journal. Our limits will not allow us to give our readers more than a brief notice of the way in which the

* *Lasiocampa Quercus*,

† *Odonestis potatoria*,

intruder, when hatched, gets rid of the legitimate contents of the nest, and we select the following. 'Previous to the above-mentioned publication' (Dr. Jenner's) 'I had taken much pains towards investigating the several phenomena I had noticed in this bird, and was so fortunate as to have ocular proof of the fact, related by Dr. Jenner, of a young cuckoo turning out of a hedge-sparrow's nest a young swallow I had put in for the purpose of experiment. It is needless to recite all the circumstances attending this extraordinary bird, as that gentleman has so amply explained it; I shall, therefore, only add, that I first saw it when a few days old, in the hedge-sparrow's nest, in a garden close to a cottage, the owner of which assured me the hedge-sparrow had four eggs, when the cuckoo dropped in a fifth; that on the morning the young cuckoo was hatched, two young hedge-sparrows were also excluded; and that, on his return from work in the evening, nothing was left in the nest but the cuckoo. At five or six days old, I took it to my house, when I frequently saw it throw out the young swallow for four or five days after. This singular action was performed by insinuating itself under the swallow, and, with its rump, forcing it out of the nest with a sort of jerk. Sometimes, indeed, it failed, after much struggling, by reason of the strength of the swallow, which was nearly full feathered; but, after a small respite from the seeming fatigue, it renewed its efforts, and seemed continually restless till it succeeded. At the end of the fifth day, this disposition ceased, and it suffered the swallow to remain in the nest unmolested.' This wonderful instinct is absolutely necessary for the self-preservation of the young cuckoo, which, if it did not dispose of all other claimants on the affection of the parents, must perish for want, and, as it is, the poor little birds to whose lot it falls to supply the demands of their craving and gigantic nestling, have a weary time of it. Indeed, there are well recorded instances, of their being assisted by others of their own species, and by other insectivorous birds.

The Romans considered the cuckoo excellent eating. Pliny (Lib. x. c. 9.) says that no bird can be compared to it for sweetness of flesh.

[*Cuculus canorus*, male.]

Oxylophus, Sw.

Bill slender, considerably compressed nearly its whole length; upper mandible entire; nostrils ovately round; head crested; wings moderate, pointed, shorter than the tail-covers, the fourth quill longest; tarsi moderate, naked; upper tail-covers long but not rigid. Inhabits the Old World; parasitic. Type, *Oxylophus Levaillantii*.

Description. Head crested, the feathers pointed; plumage above, black glossed with green; band at the base of the quills, end of the tail, and under parts of the body white; throat striped with black. Wings long but rounded, fifth quill longest. Total length fifteen inches. Mr. Swainson, whose description we have given, says that, unlike the true cuckoos, these birds rear and provide for their

young in the ordinary manner. Locality, Senegal and the western coast of Africa.

[*Oxylophus Levaillantii*.]

Erythrophrys, Sw.

Bill as in *Oxylophus*; head not crested; nostrils oval; wings lengthened, pointed, extending beyond the tail-covers, the third quill longest, the second much shorter than the fourth; tarsi moderate, naked. Inhabits the New World, and rear their own young. Type, *Cuculus Carolinensis*, Wilson. (Swainson.)

Description. Male. Bill as long as the head, compressed, slightly arched, acute, scarcely more robust than in many *Sylvia*; upper mandible carinated above, its margins acute and entire; lower mandible carinated beneath, acute. Nostrils basal, lateral, linear-elliptical, half closed by a membrane. Feet short, tarsus scutellate before and behind; toes two before, separated; two behind, one of which is versatile, the sole flat; claws slender, compressed, arched. Plumage blended, slightly glossed. Wings long, the first quill short, the third longest, the primaries tapering. Tail long, graduated, of ten feathers, which are rather narrow and rounded. Upper mandible brownish-black, yellow on the margin towards the base; under mandible yellow. Iris hazel. Feet greyish-blue. The general colour of the upper parts, including the wing-coverts and two middle tail-feathers, is light greenish-brown, deeper anteriorly. Primary quills with the inner webs brownish-orange. Tail-feathers, excepting the two middle ones, black, the next two entirely black, the rest broadly tipped with white, the outermost white on the outer web. The under parts are greyish-white. Length 12½ inches, extent of wings 16; bill along the ridge 1, along the gap 1½.

The female differs very little from the male in colouring. (Audubon.)

Habits, &c. The author whose specific description we have given above, thus graphically describes the habits of the yellow-billed Cuckoo, *Cuculus Carolinensis* of Wilson, *Coccyzus Americanus* of the prince of Musignano, *Cuculus Americanus* of Linnæus, and *Carolina Cookoo* of Latham. 'The flight of the bird is rapid, silent, and horizontal, as it moves from one tree to another, or across a field or river, and is generally continued amongst the branches of the trees in our woods. When making its way among the branches, it occasionally inclines the body to either side, so as alternately to show its whole upper or under parts. During its southward migration, it flies high in the air, and in such loose flocks that the birds might seem to follow each other, instead of their keeping company together. On the other hand, early in March, the greater

number enter our southern boundaries singly, the males arriving first, and the females a few weeks after. They do not fly in a continued line, but in a broad front, as, while travelling with great rapidity in a steam-boat, so as to include a range of a hundred miles in one day, I have observed this cuckoo crossing the Mississippi at many different points on the same day. At this season they resort to the deepest shades of the forests, and intimate their presence by the frequent repetition of their dull and unmusical notes, which are not unlike those of the young bull-frog. These notes may be represented by the word *cow, cow*, repeated eight or ten times with increasing rapidity. In fact, from the resemblance of its notes to that word, this Cuckoo is named *Cow Bird* in nearly every part of the union. The Dutch farmers of Pennsylvania know it better by the name of *Rain-crow*, and in Louisiana the French settlers call it *Coucou*. It robs smaller birds of their eggs, which it sucks on all occasions, and is cowardly and shy without being vigilant. On this latter account it often falls a prey to several species of Hawks, of which the Pigeon-Hawk (*Falco columbarius*) may be considered as its most dangerous enemy. It prefers the southern states for its residence, and when very mild winters occur in Louisiana, some individuals remain there, not finding it necessary to go farther south. This bird is not abundant anywhere, and yet is found very far north. I have met with it in all the low grounds and damp places in Massachusetts, along the line of Upper Canada, pretty high on the Mississippi and Arkansas, and in every state between these boundary lines. Its appearance in the state of New York seldom takes place before the beginning of May, and at Green Bay not until the middle of that month. A pair here and there seem to appropriate certain tracts to themselves, where they rear their young in peace and plenty. They feed on insects, such as caterpillars and butterflies, as well as on berries of many kinds, evincing a special predilection for the mulberry. In autumn they eat many grapes, and I have seen them supporting themselves by a momentary motion of their wings opposite a bunch, as if selecting the ripest, when they would seize it and return to a branch, repeating their visits in this manner until satiated. They now and then descend to the ground to pick up a wood-snail or a beetle. They are extremely awkward at walking, and move in an ambling manner, or leap along sidewise, for which the shortness of their legs is ample excuse. They are seldom seen perched conspicuously on a twig, but on the contrary are generally to be found amongst the thickest boughs and foliage, where they emit their notes until late in autumn, at which time they discontinue them. The nest is simple, flat, composed of a few dry sticks and grass, formed much like that of the

common Dove, and like it fastened to a horizontal branch, often within the reach of man, who seldom disturbs it. It makes no particular selection as to situation or the nature of the tree, but settles anywhere indiscriminately. The eggs are four or five, of a rather elongated oval form, and bright-green colour. They rear only one brood in a season, unless the eggs are removed or destroyed. The young are principally fed with insects during the first weeks. Towards autumn they become very fat, and are fit for being eaten, although few persons, excepting the Creoles of Louisiana, shoot them for the table.' (*Ornithological Biography*, vol. i., p. 18.)

Chalcites, Less.

Bill and general structure as in *Cuculus*. Plumage metallic green; upper mandible entire; nostrils circular; wings pointed, the third quill longest, the second much longer than the fourth; tarsi very short, almost entirely plumed; rump and upper tail-covers soft. Inhabits the tropics of the Old World; parasitic. Type, *Cuculus auratus* of authors. (Swainson.)

[*Chalcites auratus*.]

Of this genus Mr. Swainson says, 'I feel much more scrupulous in adopting the genus *Chalcites*, than in proposing that of *Erythrophrys*. The beautiful little shining cuckoos, indeed, which have thus been detached have altogether the appearance of belonging to a different type from those of the genus *Cuculus*; and this idea is strengthened, when we find there are already four or five species, all distinguished at first sight by their diminutive size and their beautiful golden-green plumage. On the other hand, their actual structure is so completely that of an European group, that I must beg to be understood as being by no means satisfied on the propriety of the separation. For the present, however, I shall adopt this genus, conceiving that these splendid little birds may probably constitute the tenuirostral type of the *Cuculinae*, in which case they will be analogous to the humming-birds, and nearly all those genera whose plumage is ornamented with metallic colours. The attempt that has been made to define the group by its bill, nostrils, &c., as distinct from the cuckoos is singularly unsuccessful; while those light shades of difference really existing between *Chalcites* and *Cuculus* have been completely overlooked. *Chalcites*, in fact, has the bill, nostrils, feet, and wings of *Cuculus*, with this difference only, that the tip of the upper mandible is without the slightest indication of a notch; the second and third quill are longer than the fourth, and the feathers of the rump and upper tail-covers, instead of being thick-set and rigid, are of the same degree of density and softness as in ordinary birds. We have seen, that, however dissimilar in their appearance the foregoing groups of the *Cuculinae* may be, yet that the variation of their external structure is but slight. This consideration has much weight with me in the temporary adoption of M. Lesson's genus *Chalcites*, for we have just seen an example in *Erythrophrys*, where there is an equally slight variation in external form, yet a most important one in economy and internal organization.' (*Mag. of Zool. and Bot.*)

[*Erythrophrys Americanus*.]

Eudynamys, Horsf. and Vig.

Bill strong, thick, the under mandible not curved, and angulated beneath; upper mandible entire; *wings* pointed, the *fourth quill* longest; *tarsi* much shorter than the longest toe; the upper part plumed; *rump* and *tail-covers* soft. Inhabits the Old World. Type, *Cuculus Orientalis*, of authors. (Swainson.)

Mr. Vigors and Dr. Horsfield, who established this genus in their description of the Australian birds in the collection of the Linnæan Society (*Linn. Trans.*, vol. xv. p. 303), observe that the true *Cuckoos*, or that portion of the family of *Cuculidæ* which constitutes the genus *Cuculus* of authors, is distinguished from the remaining groups of the family by the comparative weakness of the bill, in which the *nares* are small and rounded, and situated on an elevated membrane; by the wings being strongly acuminate, the primary quill-feathers considerably exceeding the secondary in length; and by the feebleness of the legs and toes, the former of which are plumed beneath the knee, and are generally covered by the feathers. *Eudynamys*, they state, deviates from these characters, which may be considered typical in the family, by the greater strength of all these members. The bill is powerful, the under mandible more particularly, which is marked by a strong ascending *gonys*. The nostrils are wide and oval, and covered only on the upper part by a membrane. The tarsi and feet are particularly strong: the former are much compressed on the external side, exhibiting by this conformation a nearly flattened surface in front. In many of these particulars the group agrees very nearly with the neighbouring genera, *Centropus*, Ill., and *Phænicophaus*, Vieill., which have equally been separated from the typical species of the family. But it may at once be distinguished from *Centropus* by the absence of the lengthened nail to the hallux; and it will be seen equally to differ from *Phænicophaus* in its stronger, shorter, and less arcuated bill, in the wings being longer, and the tail rounded, not graduated. The compressed formation of the sides of the *tarsi* in *Eudynamys* is also wanting in *Phænicophaus*.

Locality. The species are widely distributed over the East.

Example. *Eudynamys Orientalis*, *Cuculus Orientalis*, Linn. *Coucou des Indes Orientales*, Enl., 274, fol. i. *Eastern Black Cuckoo*, Lath.

[*Eudynamys Orientalis*.]

Description. Plumage of *male*, of which the above are the synonyms, black with metallic lustre. Bill yellow.

Female. Above shining greenish-brown spotted with white, tail-feathers banded with white; whitish beneath, transversely undulated with greenish-brown. Synonyms. *Cuculus Mindanensis*, Linn. *Coucou tacheté de Mindanao*. Enl. 277. *Mindanao Cuckoo*, Lath. (Vigors and Horsfield.)

'These birds, which now generally are considered the sexes of one species, appear to be but accidental visitors in the colony. At least, Mr. Caley informs us, that he never met with more than two individuals of the male and one of the female. The male specimen in the Society's collection seems to be a young bird changing to the adult plumage. It has several pale ferruginous feathers in the lower parts of the body, and it has a single ferruginous feather streaked with black among the secondary quill-feathers of the right wing, which forms a striking contrast with the deep black of the rest. The corresponding feather on the left wing was lost, as Mr. Caley tells us, by the shot striking the wing. This bird had berries of *Cassythia* in its stomach. The native name of the male is *Cowhat*, of the female, *Bel-linging*.' (Vigors and Horsfield.)

'All the cuckoos I have yet seen,' says Mr. Swainson in his memoirs on the *Cuculidæ*, 'with more or less pointed wings, and circular nostrils, and whose habits are parasitic, will arrange themselves under one or other of the foregoing genera. Nor are there wanting considerations, drawn from their analogical resemblances in other groups, which render it highly probable that they serve to indicate a circular group. *Erythrophrys*, as the rasorial type, resembles the rufous-winged scansorial creeper; and as it is by this group that the parasitic cuckoos lead immediately to those which build nests, so we have the external characters of *Oxylophus* joined to the economy of *Coccyzus*. *Chalcites*, again, as representing the humming-birds, may be viewed as the tenuirostral type; while *Eudynamys*, with its large bill, and black glossy plumage, will become the representative of the Toucans, and of the fissirostral type. It may be questioned, indeed, whether *Cuculus* or *Oxylophus* follows *Eudynamys*; but I incline to the series in which they are here placed, from the obvious affinity of *Erythrophrys* to *Oxylophus*.' (*Mag. of Zool. and Nat.*)

Mr. Swainson promises a similar exposition of the remaining divisions, and we shall notice the other sub-families on their appearance in their alphabetical order, with the exception of the *Coccyzinae*, which will be found in the article INDICATORINÆ.

CUCULLÆA. [POLYDONTA.]

CUCUMBER, a kind of trailing annual, whose unripe fruit is used for salads and pickles. [**CUCUMIS.**] Every gardener knows so much of the cultivation of this plant as to render any general description of the process unnecessary. We only notice a few points. The finest cucumbers are always obtained from shaded plants growing in a warm damp atmosphere, and therefore growing rapidly; this is exclusively owing to the ordinary action of solar light being prevented. Under bright light, evaporation goes on with great force from the surface of the cucumber plant, the quickness of growth is thus diminished, and the fruit is formed in a more solid manner than it otherwise would be, and thus its delicacy is impaired. The effect of direct light moreover is to cause the production of whatever secretions may be natural to a plant; the natural secretions of the cucumber are bitter; hence, the less cucumbers are exposed to light while growing, the less bitter, and consequently the more delicate they will be. This sufficiently explains the superiority of cucumbers forced quickly at the dull season of the year, to those produced naturally in the open ground in autumn.

When it is an object to procure very fine and long fruit, the plant should not be allowed to bear early; all the female blossoms should be destroyed until the plant has become vigorous, and well rooted in the bed; a fruit set after that time, will grow much faster than one fertilized at an earlier time.

The best sorts of cucumbers are, for gurbens, the *Russian*, for stewing, the *large white Bonneuil*, for large size, the *Longford*; and for ordinary forcing purposes, the black spined *long prickly*, if well saved. A small sort called the *Sandy* cucumber is grown in the fields in some parts of Bedfordshire, but it is altogether inferior to the *Russian*.

CUCUMBER, SPIRTING, the English name of MORMICA ELATERIUM.

CU'CUMIS, the cucurbitaceous genus which comprehends the melon, the cucumber, and some sorts of gourd. It is distinguished from the neighbouring genera by its three thick split stigmas, and by the seeds having a thin margin. The fruit is in all cases pulpy internally, many-seeded, and divided into three or six cells when young. The following are the principal species —

1. *C. Melo*. The melon. The native country of this valuable plant is unknown. Linnæus says Tartary, but his authority is not given, and in all probability is erroneous; De Candolle says Asia; Roxburgh only knew it in a cultivated state in tropical India; and Professor Royle seems unacquainted with any wild station for it in the Himalaya regions. Cashmere is the most likely to be the country whence it sprang; for it seems to be the mother of many of our other cultivated fruits; and has from time immemorial been famous for the excellence and abundance of its melons, which form a staple article of the food of the inhabitants. For the varieties and cultivation of this fruit see *MELON*, where they are given in some detail; we only here observe that all the melons known in Europe belong to the present species, unless it be the *Winter Melon* and its varieties, and that kind possibly originates from the following species, concerning which we give an extract from the *Flora Indica* of Roxburgh.

2. *C. utilissimus*. An annual, native of the higher cultivated lands of India, but generally found in a cultivated state. 'The stems exactly as in *C. sativus*, but not quite so extensive. Tendrils simple, leaves broad-cordate, generally more or less five-lobed; lobes rounded, toothletted; above pretty smooth, below scabrous, the largest generally about six inches each way. Floral leaves of the female flowers sessile, and very small. Male flowers axillary, peduncled, crowded, but opening in succession. Female flowers axillary, peduncled, solitary, both sorts yellow, about an inch or an inch and a half in diameter. Fruit fleshy, generally a very perfect oval; when young, downy and clouded with lighter and darker green; when ripe perfectly smooth, variegated with deeper and lighter yellow; from four to six inches long, and from three to four in diameter. This appears to me to be by far the most useful species of cucumis that I know; when little more than one half grown, the fruits are oblong, and a little downy, in this state they are pickled; when ripe they are about as large as an ostrich's egg, smooth and yellow; when cut they have much the flavour of the melon, and will keep for several months, if carefully gathered without being bruised and hung up; they are also in this state eaten raw, and much used in curries by the natives. The seeds like those of other cucurbitaceous fruits, contain much farinaceous matter blended with a large portion of mild oil; the natives dry and grind them into a meal, which they employ as an article of diet; they also express a mild oil from them, which they use in food and to burn in their lamps. Experience, as well as analogy, proves these seeds to be highly nourishing, and well deserving of a more extensive culture than is bestowed on them at present. The powder of the toasted seeds mixed with sugar is said to be a powerful diuretic, and serviceable in promoting the passage of sand or gravel. As far as my observation and information go, this agriculture is chiefly confined to the Guntoor Circar, where the seeds form a considerable branch of commerce; they are mixed with those of *Holcus Sorghum* or some other of the large culmiferous tribe and sown together; these plants run on the surface of the earth, and help to shade them from the sun, so that they mutually help each other. The fruit, as I observed above, keeps well for several months if carefully gathered and suspended. This circumstance will render it a very excellent article to carry to sea during long voyages.'

3. *C. sativus*, the cucumber. Tartary is assigned to this species as its native country, but upon authority equally questionable with that for the melon. No modern traveller seems to have found it wild. [*CUCUMBER*.]

4. *C. Colocynthis*, the Colocynth gourd. This plant furnishes the drug colocynth, so well known for its purgative properties. It is found wild in the Grecian Archipelago, Egypt, and the north-eastern parts of Africa generally. Burckhardt saw it covering large tracts in Nubia; and Roxburgh speaks of it as common on the coast of Coromandel. It is doubtful, however, whether the plant of the latter botanist is not rather *C. Pseudo-Colocynthis*. This species grows like a cucumber, but has cordate-ovate, many-cut, and lobed leaves, white beneath with hairs. Its fruit is small, round, deep yellow, smooth, hard externally, with an intensely bitter pulp. The gourds are gathered in autumn, when they are beginning to turn yellow; they are then peeled and dried rapidly in stoves.

5. *C. Citrullus*, the water-melon. Its deeply-lobed and gashed leaves, and its round fruit, with a spotted rind and

a cold watery pink or white flesh, in which lie a number of black seeds, sufficiently mark this species, which is most extensively cultivated all over India and the tropics of Africa and America, and generally in hot countries, but which is of no value in the north of Europe, where high flavour is required more than cooling properties.

The other species are of little moment compared with the preceding; many are eatable, but they are in all respects inferior in quality and size. *C. Dudaim* is sometimes grown under the name of Queen Anne's Pocket Melon; but it is a mere curiosity.

CUCUMIS COLOCYNTHIS, or Bitter-apple, an annual plant, the fruit of which is about the size of but rather lighter colour than an orange; the rind smooth; when the rind has been removed, a white spongy pulp or pith is found within, which constitutes the officinal part, or the colocynth, the seeds being rejected. The rind is generally removed before reaching Europe. One hundred parts of decorticated apples consist of twenty-eight parts of pure pith, and seventy-two parts of seeds.

The active principle is a peculiar bitter principle (*Colocynthin*), which is of a resinoid nature, more soluble in alcohol than water; its solubility in water is much increased by union with extractive, combined with which it exists in the pulp, so that nearly all the virtues are yielded to a watery extract, which is generally employed for its administration. The compound extract, in the formation of which proof spirit is used, and to which are added other purgative substances and aromatics, is however preferable, and it is thereby rendered milder yet more certain in its action.

It is a purgative in very constant use, either alone, or more commonly united with mercurial purgatives: it is employed for the removal of constipation and visceral obstructions; at the commencement of fevers and other inflammatory complaints, it is of decided utility. As an overdose has all the poisonous effect of a vegetable acid, it must be used with caution.

CUCURBITA, the genus from which the natural order derives its name. It differs from cucumis in having its petals very much grown together, and the seeds a little tumid at the edge. The common gourd, *C. maxima*, with its endless varieties, the vegetable marrow, *C. ovifera*, the orange gourd, *C. aurantia*, and *C. Melopepo*, the squash or bush gourd, are the principal types. It is not a little remarkable, that the native country of these common plants is entirely unknown.

Generally speaking, the species and varieties of cucurbita are harmless and eatable, constituting a very important part of the diet of the poorer classes in countries which are subject to long summer drought. Hence in the south of Europe, in India, and Africa, they are invaluable to the inhabitants of those countries; but the orange gourd is bitter, and the bottle-gourd, *C. lagenaria*, is a dangerous poison. This species bears fruits which are at first long and cylindrical; but as they ripen, they swell exclusively at the upper end, and acquire the form of a flask, the neck of which is their base. When ripe, they become hard enough externally to hold water, and accordingly when the pulp is removed, they form good bottles, and are extensively employed for that purpose. It is necessary however that they should be repeatedly washed out, so as to remove all trace of a bitter principle in which they abound, otherwise their use is dangerous. Some months since (1837), a sailor was poisoned at Falmouth, by drinking beer out of a bottle-gourd improperly prepared; and Professor Royle mentions, upon the authority of an intelligent native Indian doctor, attached to the gaol hospital at Saharunpore, a case of poisoning from eating the bitter pulp of this plant, in which the symptoms were those of cholera. We mention this fact here, but at the same time we should add that the bottle-gourd is not now considered a true cucurbita, but is referred to the genus *Lagenaria*.

CUCURBITA'CEÆ, a natural order of plants, consisting of climbing or trailing species with unisexual flowers, scabrous stems and leaves, a lobed foliage, and a more or less pulpy fruit with parietal placentæ. Nearly all the species climb by means of tendrils. The greater part consists of annuals, either wholly, or in so far as their stems at least. The petals are deeply veined, and usually either yellow, white, or green.

The order abounds in useful or remarkable plants, comprehending as it does the melon, gourd, cucumber, colo-

cynth, bryony, and all the many species approaching those types. Professor Royle, in his valuable 'Illustrations,' remarks that 'They are chiefly remarkable for the power of adapting themselves to the different situations where they may be grown. Thus, we hear of their affording large and juicy fruit in the midst of the Indian desert, where water is 300 feet from the surface (Elphinstone); and they are equally grown in the dry season on the sandy islands of Indian rivers; but excess of moisture does not appear to be injurious, as the great majority are successfully cultivated in the rainy season; and Mr. Moorcroft describes an extensive cultivation of melons and cucumbers on the beds of weeds which float on the lakes of Cashmere; they are similarly cultivated in Persia and in China. (Vide *Hort. Trans.*, 2nd ser., vol. i. p. 468, and *Staunton's Embassy*). Being chiefly annuals which a few months suffice to bring to perfection, we find them succeeding in the summer temperature of northern climates, and thus extending from the line to 55° or 60° of northern latitude, and southwards to the Cape of Good Hope. Some of the species may be seen in the most arid places; others in the densest jungles. Planted at the foot of a tree, they emulate the vine in ascending its branches; and near a hut they soon cover its thatch with a coating of green. They form a principal portion of the culture of Indian gardens: the farmer even rears them in the neighbourhood of his wells.'

Two principles especially deserve attention in this order; the one saccharine and nutritious, the other bitter, acrid, and purgative; and the qualities of the products of the species vary according to the preponderance of the one or the other. In the melon, the gourd, and their allies, the first exists almost exclusively, and hence the edible nature of their fruit; but even here its well-known laxative quality sufficiently attests the presence of the bitter principle in some degree. In the colocynth, the bottle-gourd, various species of luffa, bryony, and others, the bitter principle is found in a state of concentration, and hence the active and even dangerous qualities of those plants, from which the cucumber itself is not exempt: only its bitterness is destroyed by the peculiar cultivation of that plant. The seeds of some kinds yield oil; and those of *Cucumis Mo-mo-dica* are said to be ground into a kind of meal.

[*Momordica Balsamina*.]

1, A sterile flower; 2, a fertile flower; 3, a section of a seed; 4, the embryo.

CUDDAPAH, or KIRPA, a corruption of the Sanscrit word *Cripa*, signifying mercy. This division of the Balaghaut territory, ceded to the English by the Nizam in 1800, is situated between 13° and 16° N. lat., and between 77° and 80° E. long. [BALAGHAUT.] Cuddapah has been constituted a collectorate by the English, and contains seven subdivisions, viz., Cuddapah, Cummum, Dupaud, Gandicotta, Gurrumcondah, Punganoor, and Sidout: each of these subdivisions is named after its capital town. Throughout this collectorate, saltpetre, soda, and common salt are found abundantly, and to this cause it is owing that, except in the rainy season, the water is generally brackish.

The town of Cuddapah, in 14° 32' north lat., and 78° 54' east long., stands 507 feet above the level of the sea, on both sides of the river Cuddapah, a small stream which rises in the hills to the south-east of the town. This town was long the capital of an independent Patan state, and so continued for some time after the destruction of the kingdoms of the Deccan. The palace of the former nabobs has been converted into a court of justice and a prison. In the country surrounding the town a considerable quantity of sugar is made. The celebrated diamond mines of Cuddapah are about seven miles north-east of the town, on both sides of the Pennar River. These mines have, it is said, been worked for several hundred years with various success. The places in which diamonds have hitherto been found consist either of alluvial soil or of rocks of the latest formation. The mines are pits of small depth. The diamonds are not scattered through the whole of the mine from the surface to the greatest depth, but occur in beds always harder than the adjacent soil, and usually not exceeding one or two feet in thickness. Dr. Heyne, who carefully examined these mines, has given in his statistical tracts the following description of one. 'The uppermost, or superficial stratum, consists of sand or gravel, mixed with a small proportion of loam. Its thickness scarcely exceeds a foot and a half. Immediately under it is a bed of stiff blueish or black mud, similar to what are seen in places that have been inundated; it is about five feet thick, and contains no stones. The diamond bed comes next, and is easily distinguished from the incumbent bed by the great number of large rounded stones which it contains. It is about two feet or two and a half thick, and is composed of large round stones, pebbles, and gravel connected together by clay.' The contents of this bed are put into a eistern about eight feet square and three feet deep, when water is poured into it, which separates the clay and loamy particles, leaving the gravel and small stones at the bottom. These being removed are thinly spread upon a smooth surface about twenty feet square of hardened clay, and six or seven people examine the whole very carefully several times. At first they pick out the large stones; at the second and subsequent examinations the smaller gravel is carefully turned over by the hand, while they 'watch for the spark from the diamond, which invariably strikes the eye.' Cuddapah is 153 miles from Madras, and 220 miles from Seringapatam, travelling distance. Cummum, the capital of the subdivision of that name, is in 15° 37' north lat. and 79° 10' east long., 56 miles north-west from Ongole. Dupaud stands in 15° 58' north lat. and 79° 23' east long. This division, which is traversed by the Gondigam River, contains copper ore of good quality. The town and fort of Gandicotta are in 14° 51' north lat. and 78° 23' east long., 43 miles north-west from the town of Cuddapah. This was formerly considered a place of much strength; it is now of but little importance; there is a diamond mine in the neighbourhood. Gurrumcondah, near the verge of the eastern Ghauts, is situated in 13° 46' north lat. and 78° 34' east long., about 130 miles north-west from Madras. The district is well watered by several mountain streams, and is very productive. Punganoor is a fortified town, in 13° 21' north lat. and 78° 3' east long., 47 miles north-west from Vellore. Sidout is a fortified town, in 14° 30' north lat. and 79° 2' east long., twelve miles east of Cuddapah. It is surrounded by high stone walls in good repair, within which are ramparts; the fort is commanded by some of the neighbouring hills. It was taken by Hyder, who carried away the family of the nabob, and placed them in confinement. The town has much declined in population since the country has been in possession of the English, and the removal of the government offices to Cuddapah.

With great facilities for ascertaining the amount of the population throughout British India, little has been done

to that end upon which reliance can be placed. The entire population of the collectorate of Cuddapah was stated to amount, in 1806-7, to 1,066,237; and in 1822-3 to 1,094,460 souls, of whom 578,461 were males, and 515,999 females. The number was stated, in 1828-9, at no more than 981,562; and it is alleged that this diminution was caused by the cholera. The great bulk of the inhabitants are Hindus. Returns were made by the collector in 1826, from which it appeared that throughout the whole of Cuddapah there were then only 494 schools, in which were instructed 6000 scholars, 5658 of whom were Hindus, and 342 Mohammedans.

(Rennell's *Memoir of a Map of Hindustan*; Heyne's *Statistical Tracts on India*; *Report of Committee of Commons on the Affairs of India in 1832*.)

CUDDALORE, a town in the Carnatic province, on the western shore of the Bay of Bengal, in $11^{\circ} 44'$ north lat., and $79^{\circ} 50'$ east long. The town is built on both sides of the Pennar River; the houses on the north side are modern, and many of them handsome. The dwelling of the collector, the principal resident European officer, is a large and elegant structure, with avenues of fine trees. The streets on the south side, called the Old Town, are many of them spacious, and contain several handsome houses. Altogether, Cuddalore is one of the handsomest towns in the south of the peninsula.

Cuddalore was taken from the French by the army under Colonel Coote in April, 1760, and remained under the government of the nabob of Arcot until April, 1782, when it was taken by the rajah of Mysore, assisted by a body of French troops. In June of the following year, the town was attacked by a British force under General Stuart, which was repeatedly defeated, and suffered great loss in attempts to carry the place by assault. The last of these attacks, in which the besiegers lost 600 men, occurred only two days before the arrival of the news of peace having been concluded between France and England: this event of course put an end to hostile operations. Cuddalore, with the remainder of the province of Arcot, came into possession of the English by treaty in 1795, and has so continued.

(Rennell's *Memoir of a Map of Hindustan*; Mills' *History of British India*.)

CUDWORTH, RALPH, was born at Aller, in Somersetshire, in 1617. Having been entered at Emmanuel College, Cambridge, in 1630, when he was but thirteen, he commenced residence in 1632, and became in due course of time, as his father had been before him, a fellow of Emmanuel. He acted for some time as tutor in the college, and had among his pupils the afterwards celebrated Sir William Temple. He had taken the degree of M.A. in 1639; he took that of B.D. in 1644, maintaining upon this occasion the two following theses: 1. *Dantur boni et mali rationes æternæ et indispensabiles*; 2. *Dantur substantiæ incorporeæ suâ naturâ immortales*. In 1644 he was also appointed master of Clare Hall; and in the succeeding year was elected to the regius professorship of Hebrew. On receiving this appointment he devoted himself with zeal to the subject of Jewish antiquities. He took the degree of D.D. in 1651. Though holding the two situations which have been mentioned, and besides these the living of North Cadbury, in Somersetshire, worth 300*l.* a year, to which he had been presented by his college shortly after taking his master's degree, he did not find his means sufficient for his support. It does not appear that he was a man extravagant in his habits; but owing, it is said, to pecuniary difficulties, he now absented himself for some time from Cambridge. He returned in 1654, having been chosen master of Christ's College. He now married, and the remainder of his life was spent in this college. In 1662 he was presented by the then bishop of London to the vicarage of Ashwell, in Hertfordshire; and in 1678 he was installed prebendary of Gloucester. In this last-mentioned year appeared his great work, the 'True Intellectual System of the Universe;' or rather (for though complete in itself, it is but a fragment of a larger work which he designed), the first part of the Intellectual System. This first part is devoted to the refutation of atheism. The whole work was to consist of three parts; but the second and third parts, which were to treat respectively of the nature of moral distinctions and of free will, were, though written, never published by him.*

* Dr. Birch, in the memoir prefixed to his edition of the 'Intellectual System,' having related the calumnious charges of atheism brought against Cudworth

Dr. Cudworth died at Cambridge, in 1688, in the 71st year of his age, and was buried in Christ's College. He left one daughter, who married Sir Francis Masham, and who is known, under the name of Lady Masham, as the friend of Locke.

Dr. Cudworth was one of that set of Cambridge divines, Latitudinarians, Arminians, and Socinians, as they were called by those who having nothing definite to bring against them resorted to ugly names, on whom Bishop Burnet has passed a high eulogium in his history of the reign of Charles II.* The chief others at this time were Drs. Whitecot, Wilkins, Henry More, and Worthington. 'Dr. Whitecot,' says Burnet, 'set young students much on reading the antient philosophers, chiefly Plato, Tully, and Plotin, and on considering the Christian religion as a doctrine sent from God, both to elevate and sweeten human nature, in which he was a great example, as well as wise and kind instructor. Cudworth carried this on with a great strength of genius and a vast compass of learning. He was a man of great conduct and prudence; upon which his enemies did very falsely accuse him of craft and dissimulation.' (*Hist. of his own Time*, vol. i., p. 321.)

The 'Intellectual System,' or that (properly the first) part of it which now passes under the name, is directed, as has been said, against atheism. This is one of three, as Cudworth conceives, false systems or hypotheses of the universe, or one of three possible modes of fatalism. They are thus briefly described in the preface:—'Of the three fatalisms or false hypotheses of the universe mentioned in the beginning of this book, one is absolute Atheism, another immoral Theism, or religion without any natural justice and morality (all just and unjust, according to this hypothesis, being mere thetical or factitious things, made by arbitrary will and command only), the third and last, such a Theism as acknowledges not only a God or omnipotent understanding Being, but also natural justice and morality, founded in him, and derived from him; nevertheless no liberty from necessity anywhere, and therefore no distributive or retributive justice in the world.' Before erecting the true intellectual system of the universe (the epithet *intellectual* being used, as he tells us, 'to distinguish it from the other, vulgarly so called, systems of the world, that is, the visible and corporeal world, the Ptolemaic, Ty-chonic, and Copernican'), it was his object to demolish these false systems. And the first of them, atheism, or the atheistic fate, is attempted to be demolished in the first part, which is all that we have under the name of 'Intellectual System.' It is a work of great learning, and also of great acuteness. Lord Bolingbroke has said of Cudworth, that he read too much to think enough, and admired too much to think freely; a criticism which, certainly unjust, appears plausible only from the well-known extent of Cudworth's erudition. But graver charges have been founded upon this work. 'You know,' says Lord Shaftesbury, 'the common fate of those who dare to appear fair authors. What was that pious and learned man's case who wrote the Intellectual System of the Universe? I confess it was pleasant enough to consider, that though the whole world were no less satisfied with his capacity and learning than with his sincerity in the cause of the Deity, yet was he accused of giving the upper hand to the atheists, for having only stated their reasons and those of their adversaries fairly together.' (*Characteristics*, vol. ii. p. 262.)

'There wanted not country clergymen,' says Warburton, 'to lead the cry and tell the world that, under pretence of defending revelation, he wrote in the very manner that an artful infidel might naturally be supposed to use in writing against it; . . . that with incredible industry and reading, he had rummaged all antiquity for atheistical arguments, which he neither knew how, nor intended, to an-

on the appearance of this work, goes on to quote the following remark of Warburton's:—'The silly calumny was believed; the much injured author grew disgusted; his ardour slackened; and the rest and far greatest part of the defence never appeared.' (p. 22.) Though this does not necessarily imply that the remainder of the work was not written, the inference would not be a very forced one. Nor does Dr. Birch ever explicitly state that the second and third parts were written, contenting himself with the remark—'He left several posthumous works, most of which seem to be a continuation of his "Intellectual System," of which he had given the world only the first part.' (p. 31.) A reference merely to Dr. Cudworth's preface, in which he makes a division of his subject, or to the beginning of his first chapter, would have shown that the treatise on Eternal and Immutable Morality, which has been published since his death, is the second part, and the treatise on Liberty and Necessity, which is still in MS., is the third part of the work.

* An account and defence of these divines is to be found in a tract entitled 'An Account of the new Sect of Latitude-men at Cambridge,' which was reprinted in the second volume of the *Phoenix*, London, 1708.

swer; in a word, that he was an atheist in his heart, and an Arian in his book.' (*Divine Legation of Moses*, vol. iii., ed. 1765. Preface.) The accusation alluded to in these passages is made in a circuitous way by a Mr. John Turner, in a 'Discourse of the Messiah.'

In attacking atheism, or the atheistic fate, Dr. Cudworth describes the atomic physiology which, as held by Democritus, and other antient philosophers, involved atheism. It being his object to demolish atheism under every form, and therefore the atomic atheism, he yet adopts the atomic physiology, contending that 'so far from being either the mother or nurse of atheism, or any ways favourable thereunto (as is vulgarly supposed), it is indeed the most opposite to it of any, and the greatest defence against the same.' For the better confutation of other forms of atheism, to which he gives the names Hylozoic and Cosmo-plastic, he makes the hypothesis of an 'artificial, regular, and plastic nature,' working in complete subordination to the Deity. And to avert an argument brought against the oneness of the Deity, from its unnaturalness as shown by the general prevalence of Polytheism among the Pagan nations, he contends that 'the Pagan theologers all along acknowledged one sovereign and omnipotent Deity, from which all their other gods were generated or created,' and that their Polytheism was but a polyonymy of one God.

The 'Treatise on Eternal and Immutable Morality' corresponds to the second part of the 'Intellectual System.' It is directed against those who 'affirm justice and injustice to be only by law and not by nature;' among which affirmers he places, erroneously in our opinion, Hobbes.

Besides the 'Intellectual System,' Dr. Cudworth published, 1. 'A Discourse concerning the true Notion of the Lord's Supper,' in which he maintains, as Warburton has since maintained, that the Lord's Supper is a feast upon a sacrifice; 2. A Treatise, entitled, 'The Union of Christ and the Church Shadowed, or in a Shadow;' 3. 'A Sermon on John ii. 3-4, preached in 1647 before the House of Commons on a day of Public Humiliation;' 4. 'A Sermon preached in 1664 at Lincoln's Inn, on 1 Cor. xv. 57;' 5. A Treatise, entitled, 'Deus Justificatus, or the Divine Goodness vindicated and cleared, against the assertors of absolute and inconditionate Reprobation.'

He left several works in manuscript, only one of which has yet been published; viz., the 'Treatise concerning Eternal and Immutable Morality,' which appeared with a preface by Dr. Chandler, Bishop of Durham, in 1731. The rest are, 'A Discourse of Moral Good and Evil;' 2. 'A Discourse of Liberty and Necessity, in which the grounds of the Atheistical Philosophy are confuted, and Morality vindicated and explained;' 3. 'A Commentary on Daniel's Prophecy of the Seventy Weeks;' 4. 'Of the Verity of the Christian Religion against the Jews;' 5. 'A Discourse of the Creation of the World, and Immortality of the Soul;' 6. 'A Treatise on Hebrew Learning;' 7. 'An Explanation of Hobbes's Notion of God, and of the extension of Spirits.' These manuscripts, after having passed through many dangers, were finally purchased for the British Museum, in which institution they now are.

An abridgment of the 'Intellectual System' was published in 1706 by Mr. Wise, Fellow of Exeter College, Oxford, in two volumes, 4to. In 1733 a Latin translation was published by Dr. Mosheim, at Jena; in which the numerous errors in Cudworth's numerous quotations are corrected, and whose style is less complicated than that of the original: a French translation, which had been commenced by M. Bourdelin, a member of the French academy, was prevented from being finished by the death of the translator. That part of the 'Intellectual System' which treats of the 'plastic nature' gave rise to a controversy between M. Bayle and M. Le Clerc; the former of whom contended that such an hypothesis went to show the possibility of Hylozoism, while the latter defended Cudworth by representing it as a mere instrument of the Deity. M. Le Clerc's articles, which are valuable commentaries on this part of Cudworth's work, are in the *Bibliothèque Choisie*, tom v., vi., vii., ix. (Kippis's *Biographia Britannica*; Mosheim's and Birch's *Lives*.)

CUE'NÇA, a province of Spain, in New Castile, is bounded to the north by the provinces of Guadalaxara and Soria, on the east by Aragon and Valencia, south by Murcia and La Mancha, and west by Guadalaxara and Toledo. It is one of the most elevated provinces of Spain, its north and east parts being occupied by the high central chain,

which runs nearly north and south on the borders of Aragon and Castile, being a continuation of the Sierra de Oca, and assumes in succession the names of Sierra de Molina, Sierra de Albarracim, in Aragon, and lastly, of Sierra de Cuença. [CASTILLA.] The Tagus, several affluents of the Guadiana, and the Xucar, have their sources in the province of Cuença. This region formed part of the country of the Celtiberi. It is now divided into three partidos or administrative districts, Cuença, Huete, and S. Clemente. There are two cities, Cuença and Huete, 245 small towns or boroughs, and about 200 villages. The mountainous part abounds with timber trees, fit for house and ship building. The inhabitants of the mountains are chiefly shepherds, and have numerous flocks of sheep. Wool is one of the staple products of the country, part of which is exported, and part manufactured into coarse cloth, carpets, baize, &c., the manufactures of which were once very flourishing in this province, but are now much decayed. There are also manufactories of leather, paper, and soap. The west and south parts of the province consist of arid and in great part uncultivated plains. Cuença is altogether one of the thinnest peopled provinces in Spain. The country produces corn, oil, wine, honey, wax, fruit, and saffron, which last forms an important article of exportation. It also abounds with game, and the rivers and lakes with trout and other fish. There are several small but very deep lakes, one of which, near Montealegre, is salt. Jasper of various colours, and silver, copper, iron, coals, and alum, are also found. The length of the province from north to south is about 120 miles, and its medium breadth between 70 and 80; and the population, as given by Miñano, is 326,000. The same author gives the following statistics of the annual income or produce of the country: land in possession of the laity, 15,870,000 reales de vellon; ditto belonging to the church and convents, 4,646,000 reales; rent of houses belonging to the laity, 3,244,000; ditto belonging to the clergy, 5,221,000. (*Diccionario Geografico estadístico de España*, 1830.) The climate is generally healthy; the inhabitants are laborious and honest, and much attached to their native soil, which few of them are induced to quit.

CUE'NÇA, the town of, stands nearly in the centre of the province, on a steep hill, surrounded by higher mountains, and just above the confluence of the Huecar and Xucar, 80 miles east by south of Madrid. It is a bishop's see, and is one of the cities which sent deputies to the old cortes of Castile. It has many churches, seven convents of Monks and six of Nuns, two hospitals, besides one for foundlings, three colleges, and a clerical seminary. The cathedral is large and handsome; the interior is rich in jasper and other valuable stones; one of the altars, which is dedicated to St. Julian, is much admired for the beauty of the materials and workmanship. Several of the convents are possessed of good paintings. The population is stated by Miñano to be 7,800. Cuença is surrounded by walls: the streets are mostly very steep; the town is well supplied with water. There is a handsome bridge over the Huecar outside of the town. Cardinal Gil de Albornoz and Alonso de Ojeda, one of the discoverers and conquerors of America, were natives of Cuença.

CUERS. [VAR, Department.]

CUIRASS or CUIRASSE, a piece of defensive armour, made of plate well hammered, serving to cover the body from the neck to the girdle, both before and behind; the front called the breast, the hinder part the back-plate; these were fastened to each other by straps, buckles, hooks, or some other contrivance. The name is supposed to be derived from *Curatia* or *Curassa*, a Latin word of the middle age, which occurs in charters at least as early as the fourteenth century (Meyrick's *Glossary of Military Terms*), originally derived from the French *cuir* or the Latin *corium*, 'a hide,' the earliest cuirasses being made of leather, though afterwards chiefly of metal, both brass and iron.

This species of armour was known to the Greeks and Romans. A breast and back-plate of Roman workmanship are preserved among the Hamilton antiquities in the British Museum, which, when worn, appear to have been held together by strings or wires, fastened to nipples in front. In later ages the cuirass was disused, and was not revived in Europe till about the beginning of the fourteenth century. In England it was disused after the reign of Charles II., except in one instance; but has of late years

been revived for our cavalry. The cuirass was stated in Col. Lygon's evidence before a committee of the House of Commons on army and navy appointments, in 1833, to have been introduced as a part of the accoutrements of the Life-Guards within the preceding twelve years. To a question, 'Can you state what was the purchase-cost per man of the cuirass?' he answered, 'I apprehend they cost nothing; they have been lying in the Tower for years, and were worn at the battle of Dettingen.'

In the Romish calendar, under October 14, we find the name of St. Dominic, who is called *loricatus* or the cuirassed, a title given to a saint of the eleventh century, who constantly wore an iron cuirass next to his skin.

CUIRASSIERS, heavy cavalry armed with cuirasses. Most of the German powers, especially the emperor of Austria and the king of Prussia, have regiments of cuirassiers. They also form a portion of the French cavalry. In England we have no regiments which go by this denomination, although what are called the life-guards now wear the cuirass.

CUJA'CIUS, CUJAS, JACQUES, was born at Toulouse in the year 1520. The day of his birth is unknown. His father, a tanner of Toulouse, was named Cujas, which the son changed into Cujas, for the purpose of making the name better suited for the Latinized form of Cujacius. In the latter part of his life he often signed De Cujas. Cujas, at an early age, distinguished himself by his talents and assiduity, and is said to have learned Greek and Latin by himself without any teacher. He studied law at Toulouse under Arnold Ferrier, for whom he entertained a high respect all his life; but he acquired the best part of his extensive knowledge by his own industry. With unwearied labour he studied all the works of the best civilians, and exercised himself in discussions with his fellow-students. In 1547 he began to lecture on Justinian's Institutes with great applause, and soon acquired such a reputation that the most distinguished men of the country, as President Dufaur and John de Foix, sent their sons to Toulouse to study under Cujas. In 1554 a professorship of the Roman law being vacant in the university of Toulouse, Cujas was a candidate, but, by the intrigues of his enemies, a man of very moderate talents, Stephen Forcadet, was preferred. Shortly after, being invited to Cahors as professor of law, he removed there with the greater part of his pupils. In the following year Margaret de Valois, at the suggestion of the Chancellor l'Hôpital, invited Cujas, as professor of law, to the university of Bourges. At that time there were two celebrated lawyers in Bourges, Hugh Doneau (Donellus) and Francis Duarin (Duarenus), both of whom became the rivals and enemies of Cujas. This was particularly the case with Duarin, who excited the students against Cujas to such a degree that, as Cujas also had a party of his own among the students, great disturbances would have arisen if he had not left the place. Having removed to Paris he was invited by a deputation from the city of Valentia to accept a professorship in that university. Cujas accepted the invitation; but Duarin having died in the year 1559, he returned to Bourges, where he resided till 1566. In the meantime Margaret de Valois, his patroness, had married the duke of Savoy, who gave Cujas an invitation as professor to the university of Turin. Not liking Italy, he returned to Valence as professor, and lived there till 1575, with some short interruptions, when he left on account of the religious quarrels which disturbed that city. During his residence in Valence the reputation of Cujas rose to its height. Young men from all parts of Europe, and particularly from Germany, not only students of law but those who were devoted to other sciences, came to Valence to study under Cujas. Among his pupils was Joseph Scaliger, the most celebrated philologist of his time, and James Augustus de Thou (Thuanus), the French historian. Henry III. of France made Cujas counsellor in the parliament of Grenoble, and loaded him with honours. In 1575 Cujas returned to Bourges as professor; but to avoid the religious troubles he again left Bourges for a year, during which he lectured on the civil law at Paris. Returning to Bourges he resided there till his death, having refused an invitation from Pope Gregory XIII., as professor in the university of Bologna.

The latter years of his life were greatly troubled by the religious disturbances which then distracted France. On the death of Henry III. the party of the Cardinal de Bourbon made great promises to Cujas, if he would write in fa-

our of the cardinal against the rights of Henry IV. Cujas refused the proposals, and the fanatics of Bourges being excited against him by his enemies, he nearly lost his life in a tumult. On the 4th October, 1590, Cujas died of grief, as it is said, for the wretched situation of his country, in which civil war had dissolved all social order. Both friends and enemies united in honouring him with a splendid funeral.

Cujas was twice married. He had a son of great talents, who died in 1581; and a daughter by his second marriage, who was notorious for her disorderly life.

Cujas was distinguished both as a teacher and a writer. His merits principally consisted in substituting a more rational system in place of the unscientific method of Bartolus, and in grounding his interpretation of the civil law on a profound study of the original authors, and of the manuscripts of the Roman law. He possessed in his own library 500 MS. on the Roman law. His knowledge of archæology also and his exact acquaintance with the ancient languages gave him a decided superiority over other civilians. In teaching as well as in his writings he followed the exegetical method, in which he may still be considered as a model.

The works of Cujas are very numerous. They are commonly divided into Opera Priora, which were published in his life by himself: first at Paris, 1577, 5 vols. fol., and again in 1583; and Opera Posthuma, which were edited by his friends after his death. Both the Opera Priora and Posthuma were first collected and edited by Alexander Scot, Lyon, 1614. The most complete edition is that by Fabrot, Paris, 1658, 10 vols. fol. As it is very difficult to find what we want in the works of Cujas, the 'Promptuarium Operum Jacobi Cujaci; auctore Dom. Alburnensi,' Naples, 1763, 2 vols. fol. is of great assistance.

The works of Cujas consist: 1. Of editions of the original works on the civil law, principally of the Codex Theodosianus, Pauli receptæ sententiæ, Justinian's Institutes, of the three latter books of the Codex Justinianus; of the Consuetudines Feudorum with notes, and a translation of the sixtieth book of the Basilika, of which he also published an edition; 2. Of commentaries, notes, and interpretations relating to most parts of the Institutes, Pandects, Code, and Novels; a Commentary on the Decretals; and Lectures on many passages of the Pandects; 3. Other important works, as his Observationum and Emendationum libri xxviii., a work which civilians in the time of Cujas called 'opus incomparabile et divinum.' It contains corrections of the original works on law and of a great number of other authors, both Greek and Latin. This work is a real treasure to philologists; 4. Paratilla ad Digesta, et in libros ix., Codicis, which is a summary of the titles of the Pandects and the Constitutions of the Code.

(*Elloge de Cujas*, par Bernardi, Lyon, 1775; *Histoire de Cujas*, par Berriot; Saint Prix, *History of the Roman Law*, which is the best biography of Cujas; *Ed. Spangenberg; Cujas und seine Zeitgenossen*. Leipzig, 1822.)

CULEX. [CULICIDES.]

CULICIDES (Latreille), a family of dipterous insects of the section Nemocera. Technical characters:—Proboscis long and slender, projecting forwards, usually straight, terminated by two little lip-like appendages; sucker composed of six slender bristle-like members: palpi five-jointed, generally elongated; antennæ filiform, covered with hairs—in the male sex resembling little plumes; eyes contiguous: no ocelli; wings inclined, lying close to the body when at rest, and having one marginal and two sub-marginal cells.

The Culicides, according to Latreille, constitutes the first family of dipterous insects, and is the same group as that designated by Linnæus *Culex*. It is divided into three genera, distinguished principally by the following characters:

Palpi equal in length to the proboscis in both sexes; genus 1, *Anopheles* (Meigen).

Palpi of the males longer than the proboscis, and in the females very short; genus 2, *Culex*.

Palpi shorter than the proboscis in both sexes; genus 3, *Ædes*.

We are but too well acquainted with the torment inflicted by the insects of this tribe, which are known in this country by the name of *Gnats*, are called in France *Cousins* and in America *Mosquitoes*.

The pain and irritation are caused by their piercing the skin to feed upon the blood (by means of the little bristles forming part of the proboscis), and injecting at the same

time a poisonous fluid. It is said the females alone are the persecutors.

The humming noise accompanying their flight is produced by the vibration of their wings. Gnats seldom appear during the day-time, except in thick woods, and they always abound most in damp situations, a circumstance owing to the habits of their larvæ, which reside in stagnant waters.

The female gnat deposits her eggs (which amount to 200 or 300 in a year) one by one; and as they are deposited, they are joined together, and form a little raft, which floats on the surface of the water. The eggs are hatched in about three days' time, and produce little greenish larvæ, which have a distinct head and lengthened body, composed of numerous segments. The head is furnished with two ciliated organs, which are in constant motion. This motion appears to be for the purpose of creating a current, by which means minute animalculæ, or other substances which may constitute the food of the animal, are drawn into the mouth. Two other appendages, furnished with tufts of hair, appear to co-operate with the former for this purpose.

The breathing apparatus of the larva consists of a tube, terminated by radiating setæ situated at the apex of the body; through this tube the air is conveyed to the tracheæ, and for this purpose it is brought to the surface of the water, so that the animal is then in an inverted position. There is another apparatus also, situated at the tail of the animal, opposed to the breathing apparatus, which serves as a fin, and enables the larva to swim and dive with considerable velocity.

These larvæ are full grown in about fifteen days' time; they next assume the pupa state; the animal then appears to have a rounded form, owing to the apex of the body being recurved. It still inhabits the water, and is active; the position of its breathing apparatus is, however, altered, it being now situated on the anterior part of the body, and consists of two little tubes, which, as before, are applied to the surface of the water for the reception of air. When about to assume the imago state, the skin which covered the pupa being loosened from the animal within, and the space between the two being occupied with air, it floats upon the surface of the water; the gnat breaks through the upper part, and stands on the skin it has quitted, and which now serves as a little boat, upon which it floats until it has attained strength to fly.

Culex pipiens, Linn., the common gnat, is less than a quarter of an inch in length; the palpi and antennæ are brown; the thorax is of a yellowish brown, with two darker lines; the abdomen is of a pale grey colour; the legs are brown, and the base of the thighs yellowish.

The insect which is so troublesome in the island of Cuba, the mosquito (*Culex mosquito*), is not quite so large as the common gnat. Its proboscis is black; the palpi are spotted with white; the head and thorax are spotted with silvery white, and the latter has a curved band of the same hue. The edges of the segments of the body are also of a silver-like colour.

CULLEN, WILLIAM, was born in Lanarkshire, in the year 1712. His parents being in humble circumstances, he commenced the study and even the practice of physic under certain disadvantages; and after serving an apprenticeship to a surgeon-apothecary in Glasgow, he became surgeon to a merchant vessel, trading between London and the West Indies. He soon returned to his own district, and practised in the country parish of Shotts, a region proverbial, even in Scotland, for bleakness and poverty. Here an incident occurred which was perhaps his first gleam of good fortune, or, in other words, the first accident of which his genius availed itself to further his success. The duke of Argyle, while on a visit to a gentleman in the neighbourhood, was amusing himself with some chemical experiments, for which the apparatus in his possession proved insufficient: his host recollected Cullen as a person likely to supply the deficiency; he was accordingly invited to dinner, introduced to the duke, and acquired his good opinion. He soon removed to Hamilton, where he was admitted a councillor in 1737, and was chief magistrate in 1739 and 1740. Here he formed a partnership with a young man destined to attain equal celebrity, William Hunter. The chief object of this connexion was to enable them to improve their medical education; and accordingly they agreed that one of them should alternately be allowed to study during the winter at some medical school, while the other should

carry on the business in the country for the profit of both parties. Cullen took the first turn, and passed his winter at Edinburgh. Hunter, when his turn arrived, went to London, where he soon recommended himself to Dr. Douglas, a lecturer on anatomy and midwifery, who engaged him as an assistant. Thus ensued a premature dissolution of partnership; for Cullen of course threw no obstacles in the way of his friend's advancement, but readily cancelled the articles. They maintained ever after a cordial communication by letters, though it does not appear that they had ever after a personal interview.

It was during this period of country practice that Cullen was united to Miss Johnston, the amiable daughter of a neighbouring clergyman. She married him when he had no worldly advantages to recommend his suit, presented him with a numerous family, and enjoyed the gratification of sharing his dignified prosperity until 1786, when she died.

The duke of Hamilton having been suddenly taken ill at his palace, sent for Cullen, who not only benefited him by his skill, but attracted him by his conversation. It appears to have been the interest of this nobleman which procured him the situation of lecturer of chemistry in the University of Glasgow; and having previously taken his doctor's degree, he began his first course in 1746. His medical practice daily increased; and when a vacancy occurred in 1751, he was appointed by the king to the professorship of medicine. It was now that he began to show the rare and most precious talent of giving science an attractive form, diffusing clearness over abstract subjects, and making the most difficult points accessible to ordinary capacities.

In 1756 he was called to Edinburgh to fill the chair of chemistry, vacated by the death of Dr. Plummer. While holding this office, he for several years delivered clinical lectures at the royal infirmary. Alston, the professor of materia medica, died in 1763, and was succeeded by Cullen, who, though now in the middle of his chemical course, began his new subject a few days after his nomination. So great was his popularity, that while only eight or ten pupils had entered under Alston, he attracted above a hundred. On the death of Dr. Whytt, in 1766, Cullen took the chair of theoretical medicine, resigning that of chemistry to his pupil Black. The chair of practical medicine next became vacant by the death of Dr. Rutherford. Gregory started as a rival candidate to Cullen; but by an amicable compromise it was agreed that the chairs of theoretical and practical medicine should be shared between them, each lecturing on both subjects; but when Gregory was suddenly cut off in the prime of life, Cullen occupied the practical professorship alone, till within a few months of his death. As a lecturer, Dr. Cullen was the greatest ornament of Edinburgh in the days of its greatest celebrity; and, like all who have excelled in that difficult branch of the profession, he carried with him not merely the regard but the enthusiasm of his pupils. Alibert bears testimony to the impression he made upon the foreign students who resorted to his lectures, and who preserved indelible recollections of his power to convince and to awaken. He lectured from short notes, and this nearly extemporaneous delivery no doubt contributed to that warmth and variety of style which tradition ascribes to his lectures, but which are certainly not the characteristics of his published works. Cullen was great to the last; and his life was extended to the 5th of February, 1790, when, in the words of his French biographer, he closed his glorious career. The following is a list of Dr. Cullen's works: I. First Lines of the Practice of Physic, Edin., 1777, 4 vols. 8vo. This work has been frequently reprinted, and has been translated into French, German, Italian, and Latin. Dr. Cullen's system, as delivered in this book and in his lectures, superseded that of Boerhaave, of which the humoral pathology forms a part. This theory however which supposes diseases to arise from a degeneracy of the animal fluids, not only harmonizes with the instincts of mankind, but has been of late years so confirmed by chemical analysis, that it bids fair to rear up its head again in the schools of medicine. Even Cullen, the great opponent of the humoral doctrines, in his remarks on scorbutics, admits that this disease depends on a particular condition of the fluids of the body. Cullen's division of diseases into four classes is so simple, and yet so ingenious, that it is still adopted by some English lecturers. The first class contains the Pyrexiae, or febrile diseases; the second, the Neuroses, or nervous

diseases; the third, the Cachexiæ, or diseases of an ill habit of body; the fourth, the Locales, or local diseases. To give an example of each, pleurisy belongs to the first class, epilepsy to the second, scurvy to the third, and tumours to the fourth.

The doctrine of *spasm*, which is used by Cullen to solve so many difficulties in the theory of medicine, is no longer universally admitted; but the practice which he founded upon it is so good that we cannot refuse him the honour of having been one of the great improvers of the art of healing; and we concur with that excellent judge, Dr. Thomas Young, who declares the 'First Lines' to be 'an extremely elegant and valuable introduction, rather encumbered than injured by some hypothetical speculations.' (*Medical Literature*, p. 125, 2nd edit.) As Cullen's system is founded on that of Hoffmann, it seems in its turn to have given birth to that of Brown, which is perhaps merely a rude simplification of his great master's theories. [BROWN.]

II. *Institutions of Medicine*, Edin., 1777, 12mo. This is a treatise on physiology, which was translated into French, German, and Latin.

III. *An Essay on the Cold produced by evaporating Fluids, and of some other means of producing Cold*, Edin., 1777. This is annexed to Dr. Black's *Experiments upon Magnesia alba*, &c.

IV. *A Letter to Lord Cathcart, president of the Board of Police in Scotland, concerning the Recovery of Persons drowned and seemingly dead*. Edin., 1784, 8vo. At the end of the letter is the date 1774, and afterwards there is an extract from the *Journals of the Board of Police*, also dated 1774.

V. *Synopsis Nosologiæ Methodicæ*. Edin., 1785, 2 vols. 8vo. The first volume contains the nosologies of Sauvages, Linnæus, Vogel, Sagar, and Macbride; the second contains Cullen's own, which is by far the best. This work was translated into German, with some additions. Leipzig, 1786, 2 vols. 8vo.

VI. *A Treatise of the Materia Medica*. Edin., 1789, 2 vols. 4to. Translated into French and Italian, and twice into German; one of the German translations is by Hahnemann. Leipzig, 1790, 2 vols. 8vo.

Cullen's clinical lectures were published in 1797, Lond. 8vo. Dr. Young (*Med. Liter.*), after the title of the book, puts the word *surreptitious*, so that it was probably printed from the note-book of some student.

(*The Bee*, by Dr. Anderson, vol. i.; *Lives of British Physicians; Biographie Universelle*.)

CULLODEN, a house and estate belonging to the family of Forbes, about three miles north-east of Inverness, which has given name to the battle fought April 16, 1746, which put an end to the Rebellion. On the night preceding, the Highlanders had intended to surprise the duke of Cumberland in his camp at Nairn; but this scheme having failed, they took up a position on the Moor of Drum-mossie, their left wing towards the house of Culloden, where the declivity of the hill was soft and marshy, their right slightly protected by a stone wall. The ground, however, was unfavourable, being on the whole well suited to the operations of cavalry and artillery. Many of the Highlanders were absent, strong reinforcements were daily expected, and those who were present were weakened by hunger and fatigue. The question had been strongly debated, whether it would not be expedient to withdraw to the hills; but the difficulty of finding subsistence for the men and the importance of protecting Inverness determined the prince, Charles Edward, and his councillors to venture a battle, which was fought under every disadvantage, of which not the least was the indecision or incompetency of the leaders. Drawn up in line in the position above mentioned, while waiting for the signal to charge, the Highlanders suffered greatly from the English artillery. Exasperated at last beyond endurance, the centre rushed forward. This, the last charge of the Highlanders under their patriarchal discipline, and with their peculiar arms, is vividly described in Chambers's 'History of the Rebellion,' a small work replete with interest.

A Lowland gentleman, who was in the line, and who survived till a late period, used always, in relating the events of Culloden, to comment with a feeling of something like awe upon the terrific and more than natural expression of rage which glowed in every face and gleamed in every eye as he surveyed the extended line at this moment. Notwithstanding that the three files of the front line of

English poured forth their incessant fire of musketry; notwithstanding that the cannon, now loaded with grape-shot, swept the field as with a hail-storm; notwithstanding the flank fire of Wolfe's regiment, onward onward went the headlong Highlanders, flinging themselves into, rather than rushing upon, the lines of the enemy, which indeed they did not see for smoke till involved among their weapons. It was a moment of dreadful agonizing suspense, but only a moment, for the whirlwind does not sweep the forest with greater rapidity than the Highlanders cleared the line. They swept through and over that frail barrier almost as easily and instantaneously as the bounding cavalcade brushes through the morning labours of the gossamer which stretch across its path; not however with the same unconsciousness of the events. Almost every man in their front rank, chief and gentleman, fell before the deadly weapons which they had braved; and although the enemy gave way, it was not till every bayonet was bent and bloody with the strife.

'When the first line had been completely swept aside, the assailants continued their impetuous advance till they came near the second, when, being almost annihilated by a profuse and well-directed fire, the shattered remains of what had been but an hour before a numerous and confident force, at last submitted to destiny by giving way and flying. Still a few rushed on, resolved rather to die than thus forfeit their well-acquired and dearly-estimated honour. They rushed on, but not a man ever came in contact with the enemy. The last survivor perished as he reached the points of the bayonets.' It is said that, in one place, where a very vigorous attack had been made, their bodies were afterwards found in layers three or four deep.

The right wing of the Highlanders, advancing at the same time, was attacked in flank by the English cavalry and broken; the left withdrew almost without sharing in the fight. About 600 men were killed on each side. The battle, however, was decisive, and the prince fled to the mountains, and some days after gave notice to his partisans to provide for their own safety, declining to continue the contest with 8000 men, who were ready to meet him in Badenoch. The conduct of the English, especially of the duke of Cumberland, after the battle, was disgraced by extreme cruelty.

This memorable event has given occasion to many plaintive popular songs.

Drummossie Muir, Drummossie day,
A wae! day it was to me!
For there I lost my father dear,
My father dear and brethren three.

(Chambers, *Hist. of Rebellion*; Hogg, *Jacobite Relics*.)

CULM, the stem or straw of grasses.

CULM or KULM, one of the thirteen circles into which the government of Marienwerder in the province of Western Prussia is divided. Its area is about 341 square miles, and its population about 33,200. It contains two towns, Culm, and Briesen (about 1150 inhabitants). The country is watered by the Vistula in the west, where the soil is rich and productive: the more elevated parts are also fertile. Much grain, flax, tobacco, and fruit is raised, and cattle-breeding is extensive. The inhabitants are Germans and Poles intermixed.

CULM, the chief town, stands on a hill at the foot of which the Vistula flows, in 53° 21' N. lat. and 18° 25' E. long. It was founded by the knights of the Teutonic order in 1229, who instituted an academy or public school here in 1387, for which a gymnasium has been substituted in modern times.

Culm is surrounded by walls, and has 5 Roman Catholic and 1 Protestant church, a chapel, 3 nunneries, an infirmary, a Catholic ecclesiastical seminary, a cadet academy, and 3 other schools. It gives its name to the bishopric of Culm, the diocesan of which has his residence and chapter at Culmsee. The number of houses is about 400, and of inhabitants about 5100. The chief occupations of the townsmen are the manufactures of woollens, tanning, fishing, and trading. Culm was formerly one of the Hanse Towns.

CULM. [ANTHRACITE; BIDEFORD, pp. 388, 389.]

CULMBACH, a bailiwick in the northern part of the Bavarian circle of the Upper Main, the chief town of which bears the same name, and is situated in a fertile and agreeable country on the left bank of the White Main, in 50° 5' N. lat., and 11° 27' E. long. It is a well-built town of

about 500 houses and 4500 inhabitants, of whom about 180 only are Roman Catholics, the remainder Lutherans. It has three churches, a Latin school, hospital, infirmary, several breweries, potteries, a well-known earthenware manufactory, tile-houses, tanneries, &c. In the neighbourhood much potter's clay is raised; and on a mass of rock close to the town stands an old castle, the Plassenburg, at present used as a house of correction, the prisoners in which (about 400) are employed in weaving carpets and coarse woollens, and spinning yarn. The outworks of the castle were razed by the French in 1808.

CULMINATION (culmen, the summit of a thing). A star culminates, or comes to its highest point, at the moment when it is on the meridian. [TRANSIT, MERIDIAN.]

CULTIROSTRES (Ornithology), a name given by Cuvier and others to a family of birds consisting of those species which were united under the genus *Ardea* by Linnaeus, and whose bill is large, long, and strong, and most frequently pointed also, such as *Cranes*, *Herons*, *Storks*, &c.

CULVERIN. [ARTILLERY.]

CUMÆ (Κόμνη), an antient town on the coast of Campania, about ten miles west by north of Naples, which has been long since totally ruined. It is said to have been built by a colony of Chalcidians from Eubœa, and was one of the earliest Greek colonies on the coast of Italy. A colony from Cumæ originally founded Zancle, afterwards Messene, in Sicily (Thucyd. vi. 4), in the eighth century B.C. Cumæ seems to have rapidly attained great wealth and importance through its maritime trade. The Etruscans are said by Dionysius to have sent an army against Cumæ, which, however, was defeated near the banks of the Volturnus. Athenæus (xii.) describes, from older writers, its former splendour and the wealth of its citizens. According to Livy (viii. 22), the people of Palæopolis, afterwards Neapolis, were also a colony from Cumæ. The story of the Sibylline books being offered to Tarquin, attributes them to a Sibyl or prophetess, who at some remoter period resided at Cumæ. The same Tarquin the Proud, after vain attempts to recover his sovereignty, died at Cumæ, where he had sought an asylum under Aristodemus, who, himself an exile from Messenia, and driven away by the Lacedæmonians, had come to Cumæ, and usurped the sovereign power. We find, about 417 B.C., at the end of the Latin War, the people of Cumæ included in the general peace with Capua and other towns of Campania. (Livy, viii. 14.) During the second Punic War, Cumæ was still independent, and had its own senate, which, instead of siding with Hannibal, like the Campanians, took part with Rome, and by its timely information to the consul, Sempronius Gracchus, enabled him to surprise the Campanians while offering their sacrifices, and to kill a great number of them. Upon this Hannibal hastened from his camp on Mount Tifate to attack Cumæ, which was defended by Gracchus, who repulsed the Carthaginians with great loss. (Livy, xxiii. 35, 37.) Under the Romans, Cumæ gradually declined from its former importance; the superior attractions of Baiæ, owing to its more sheltered situation and more genial climate, probably contributed to the decline of Cumæ. Juvenal (*Sat.* 3.) speaks of it as comparatively depopulated. It suffered afterwards in the wars between the Goths and Narses. It was at one time a bishop's see, but the town being completely destroyed by the Saracens at the beginning of the thirteenth century, its see was incorporated with that of Naples. The town lay partly on the hill, which is rocky and steep, and partly on the sea-shore. There are the remains of an amphitheatre in the plain towards the south. The temple of Apollo stood in the Acropolis on the hill which is now called Rocca di Cumæ. The ground is here strewn with prostrate columns, capitals, and fine marble slabs with Greek inscriptions, half-covered with aromatic herbs, wild flowers, and the leaves of the vine-trees, which grow here luxuriantly. A farm-house on the hill is still called the House of the Sibyl, and the people pretend to show her baths, which are now converted into wine-presses, and her grotto, which is an excavation in the rock, leading to several subterraneous galleries half-filled with rubbish, and said to extend as far as Averno and Baiæ. Many statues have been found in this neighbourhood. (Ferro, Scotti, Jorio, Paolini, &c.) From the summit of the rock there is an extensive view, quite different in character from those near the shores of the Bay of Naples. It has a grander but more solitary and desolate aspect, extending on one side over the wide expanse of the Mediterranean, and on the

other over the lakes of Fusaro, Licoli, and Patria, and the low lands of the coast as far as Gaeta, while to the east the Mons Gaurus separates it from the coast of Pozzuoli and the Bay of Naples. The plain is strewn with the ruins of temples, villas, baths, and sepulchres. Many farm-houses are scattered about; for the country is fertile, though unwholesome in summer. The road from Pozzuoli to Cumæ passes under a fine arch or gateway, inclosed between two rocks, through which the road has been excavated. This arch, probably a work of the Roman period, is now called Arco Felice. (Paoli, *Antichità di Pozzuoli*, &c.) Petronius Arbiter, the discarded favourite of Nero, put himself to death at Cumæ in the manner related by Tacitus, *Annal.* xvi. 19.

CUMANA, a town in South America, in the republic of Venezuela, and the capital of the department of Maturin, 10° 27' 52" N. lat. and 64° 9' 27" W. long. It stands in an extensive plain, somewhat above a mile from the sea, at the entrance of the gulf of Cariaco: the port is spacious and safe. The gulf of Cariaco, which extends nearly 40 miles east and west, and is from 7 to 9 miles wide, offers excellent anchorage, being in the middle from 60 to 80 fathoms deep, but not so deep towards the shores. The entrance of the gulf, however, is not without danger; a sand-bank extends from Punta Araya for some miles, and on the southern coast there is a shoal, called Morro Roxo, which extends 550 feet east and west, and has only from one to three feet water upon it.

The plain on the southern shores of the gulf extends about 10 miles inland to the offsets of the Cerro del Bergantin, which is about 5000 feet high. On this plain rises a group of isolated hills, at the foot of one of which the town is built. On this hill, which is to the south-east of the town, and rises with a steep ascent to the height of about 180 feet, stands the castle of S. Antonio. The town is inclosed on the south and west by a small river, called Manzanares, which divides it from the three suburbs, which are nearly as populous as the town itself. The whole population probably does not exceed 12,000 souls. There is no steeple or dome in the town, and only a few trunks of tamarind, cocoa, and date trees rise above the houses. All the houses are low and slightly built, on account of the frequent earthquakes. The roofs are flat. There is only one parish church and two convents, but no remarkable building. The climate is very hot, but as the air is dry it is more healthy than other places on this coast. The articles of exportation are cattle and dried meat (*tasajo*), salted fish, and salt. The two first come from the llanos of the Orinoco; the fish is taken along the coast and in the gulf, and the salt prepared on the peninsula of Araya. These articles are principally carried to Caracas and the Windward Islands. Excellent cables of the bark of the mahoe are made here. The inhabitants of the town are white and of the mixed race; there are very few negroes. The suburbs are inhabited by the Indians, especially the Guayquerias or Gauyguerias. (Humboldt, Depons.)

CUMANIA, GREAT, an independent district in the western part of the Hungarian province 'beyond the Theiss,' lying between 47° and 47° 40' N. lat., and 20° 30' and 21° 10' E. long., independently of a small district on the right bank of the Körös, and another on the left bank of the same river. The whole surface is a low plain, containing an area of about 424 square miles, and rendered so swampy by the inundations of the Berettyó, Hortobágy, and Kakad, that nearly one half of Cumania is a mere bog. The upper part has been reclaimed to a great extent by the construction of an immense dam in the year 1786. Such portions of the soil as admit of cultivation are extremely productive, and yield plentiful crops of grain, particularly wheat and barley, melons, &c. The meadows and pastures afford excellent fodder and hay, and the rearing of cattle is carried on extensively. The land is full of bulrushes, which, with straw and dung, supply the place of fuel. The population amounts to about 43,000, of whom 5600 are Roman Catholics, and 37,000 Protestants. They are an athletic robust race of men, very fond of rural pursuits. There are no large land proprietors, or feudal lords, as in most parts of Hungary; the people have independent jurisdictions of their own; and send representatives to the Hungarian Diet. They are altogether a rich, happy, and independent people. Great Cumania contains one market-town (*Kardszag Új Szállás*) 47° 20' N. lat., and 20° 55' E. long., on the Sárret, which has about 1450 houses, and 11,100 inhabitants, and is a

thriving mart for the grain, fruit, wine, and cattle, which the exuberant fertility of the surrounding country enables the people to raise), and 5 villages, viz., Turkevi (6450 inhabitants), Madaras (7440), Kunhegges (6160), Kis Uj Szállás (6760), and Kun St. Márton (4970).

CUMANIA, LITTLE. This district, situated between the left bank of the Danube and the right bank of the Theiss, and in the Hungarian province 'this side of the Theiss,' consists of two large and three small tracts of country. The larger tracts adjoin the county of Csongrád on the east, and the counties of Bacs and Csongrád on the south; their northern boundary is the county of Pesth: two small tracts lie to the east of them, the one, next the county of Heves, consisting of two *prædia*, or privileged settlements; and the other, of Latzháza, with its small territory and two *prædia*, on the Danube, between Ratzkény and Bugyi. With the exception of a few sand-hills, the whole of Little Cumania is a complete level. Its area is altogether about 1003 square miles, and its population about 53,000, of whom 27,000 are Roman Catholics, and 26,000 Protestants. The country has no stream whatever but a brook called the Kigyòs, which flows near Szabad and Filep-Szállás, but it is full of swamps and sheets of water. Most of the land is either occupied by these swamps, or partially covered with sand; but the available surface is fertile in grain and contains fine tracts of rich loam. Besides an abundance of grain, Little Cumania produces tobacco and large quantities of excellent melons; considerable herds of cattle and sheep and a great number of horses are reared on its rich pastures. Much limestone and soda are obtained. The Palatine of Hungary is the immediate governor both of Great and Little Cumania; the Kapitányoks, or chiefs of districts, and justices of circles, are subject to his authority. The people of Little Cumania are as independent, robust of make, and rich as their brethren in Great Cumania. Little Cumania contains 3 market-towns, 5 villages, and 37 *prædia*. The towns are Halas, on the banks of the Halastó, a large sheet of water, in 46° 36' N. lat., and 19° 32' E. long. It has a population of about 10,900, and a considerable trade in grain and wine. Felegyháza, to the south-east of Ketskemet, has 12,970 inhabitants, and is embellished with a handsome edifice, where the Cumanians have their courts of justice and keep their archives. Near this place several Roman urns have been dug up. There is an extensive traffic here in grain, fruit, wine, and cattle. Kun Szent-Miklós lies on the Baker, to the south of Pesth, and has about 4300 inhabitants.

CUMBERLAND, one of the northern counties of England, lies between 54° 6' and 55° 7' N. lat., and 2° 13' and 3° 30' W. long. On the north it is bounded by the Solway Frith and Scotland for 30 miles; on the south by Westmoreland for 48 miles, and Lancashire 21 miles; on the east by Northumberland for 51 miles, and Durham 7 miles; and on the west by the Irish Sea 67 miles. The extreme length of the county is about 74 miles, and its greatest breadth 34 miles. Its circuit is 224 miles, and the area 1523 square miles, or 974,720 acres. According to the agricultural survey published in 1793, there were 470,000 acres of old inclosed land; 150,000 acres of common that might be brought into cultivation, 342,000 acres chiefly occupied by mountains, and above 8000 acres by lakes and rivers.

In consequence of the cultivation of extensive commons and waste lands, the aspect of the country has been completely changed. Without reverting to the survey made in the time of William the Conqueror, when there was 'a goodly great forest, full of woods, red deer and fallow, wild swine, and all manner of wild beasts, called the Forest of Englewood;' or to the time of Edward I., when that king, during a few days which he spent in Cumberland for the purpose of hunting, is said to have killed 200 bucks in the same forest; even within half a century, and since the last agricultural survey, more than 200,000 acres have been inclosed. Many of the commons, which previously afforded only a scanty pasturage to a few half-starved sheep and cattle, are now covered with fertile corn-fields and profitable herbage, have proper hawthorn fences, good roads, and commodious farm-buildings. A scarcity of wood forms a peculiarity in the general aspect of the country, for which two reasons may be assigned—the lords of some manors claim the wood, and the farmers dislike it on account of the injury which it does their corn-crops. In area Cumberland ranks the twelfth county in England, and in population the twenty-eighth. In 1821 the population was

156,124. In 1831 it amounted to 169,681—81,971 males and 87,710 females.

Surface, Hydrography, and Communications.—The east and south-west parts of the county are very mountainous, rugged, and uneven; the north and north-west parts are low and flat, or gently undulating. Hills, valleys, and ridges of elevated ground occupy the midland part. To a traveller, the mountainous district in the south-west is the most interesting. This part contains Saddleback, Skiddaw, and Helvellyn, and the lakes of Ullswater, Thirlmere, Derwent-water, and Bassenthwaite. This magnificent assemblage of lofty mountains and beautiful lakes annually attracts tourists from all parts of the kingdom. Several of the other districts, though not mountainous, are hilly, and present an endless variety of landscape; some of the valleys are traversed by rivers, and afford perhaps a greater variety of delightful scenery than any other county. Besides the lakes already mentioned, there are several of smaller size, equally celebrated for their diversified and picturesque scenery. Buttermere, Crummock-water, Lowes-water, Ennerdale, West-water, and Devock-lake, are frequently visited by travellers in their excursions. There are also several tarns, or small pieces of water, the chief of which are Over-water, not far from Uldale; Burn-moor-tarn, at the head of Miterdale; Tarn Wadling, near High Hesket; Talkin-tarn, in the parish of Hayton; and Martin-tarn, in that of Wigton.

The following is a tabular view of the principal lakes of Cumberland.

LAKES.	Nearest Market-towns.	Length in miles.	Breadth in miles.	Depth in feet.	Height in feet above the sea.
Ullswater . .	Penrith	9	1	210	460
Thirlmere . .	Keswick	2½	1	108	473
Derwent-water	Ditto	3	1½	72	222
Bassenthwaite	Ditto	4	1	68	210
Buttermere . .	Ditto	1½	½	90	
Crummock . .	Cockermouth	3	¾	132	260
Lowes-water . .	Ditto	1	½	64	
Ennerdale . .	Whitehaven	2½	½	80	
West-water . .	Ravinglass	3	½	270	160

The most remarkable phenomena connected with the lakes are the Floating Island and Bottom-wind, both of which are occasionally observed at Derwent-water, and neither has yet received a satisfactory explanation. All the lakes are well stocked with fish, particularly with trout, pike, and perch. Ullswater, Ennerdale, Crummock, and Buttermere, contain char; the first of these lakes abounds with eels and skellies. Salmon pass through Bassenthwaite lake to deposit their spawn in the rivers Derwent and Greta. Trout and eels are found in the tarns. Tarn Wadling produces some of the finest carp in the kingdom. There are several fine waterfalls, of which the following are the principal, with their respective situations and heights:—

	Feet.
Scale Force, near Buttermere	190
Barrow Cascade, two miles from Keswick	124
Lowdore Cascade, near Keswick	100
Sour Milk Force, near Buttermere	90
Airey Force, Gowbarrow Park	80
Nunnery Cascade, Croglin	60

The following are the names and altitudes of the principal mountains, and the districts in which they are situated:—

	Feet.
Scaw Fell (high point) Eskdale	3166
Helvellyn	3055
Skiddaw	3022
Bow Fell	2911
Cross Fell	2901
Pillar	2893
Saddleback	2787
Grassmere Fell	2756
High Pike	2101
Black Comb	1919
Dent Hill	1110
Scilly Bank	500

The offsets of the western or Skiddaw range of primitive and transition mountains extend within five miles of Carlisle, and four miles of Wigton. Those of the secondary (Cross-fell, or Penine chain) do not reach quite so far north as Tindale-fell, near Brampton.

The principal rivers in Cumberland are the Eden, the Esk, and the Derwent. The Eden enters the county on the south, where it unites with the Eamont, runs to the east of Penrith, passes Kirkoswald, Armathwaite, Corby, Warwick-bridge, and Carlisle, and discharges itself into the Solway Frith, near Rockliff, where it forms a fine æstuary. The scenery along the course of the Eden in this county, which is about thirty-five miles, is very varied and beautiful. The mansions and pleasure-grounds of Skirwith Abbey, Eden-hall, Nunnery, Armathwaite, Low-house, Corby Castle, Warwick-hall, and Rickerby, adorn its banks.

The Esk enters Cumberland from Scotland, and passes Kirk-Andrews and Netherby, flowing through a beautiful valley in a south-west direction to Longtown. After receiving the Line, which is formed by the junction of two streams arising near Christenburgh Crag, called Black Line and White Line, it falls into the Solway Frith, near Rockliff Marsh. Its course in this county is about 10 miles.

The Derwent takes its rise from Sparkling-tarn, among the crags at the head of Borrowdale, passes through Styhead-tarn, and forms the lake of Derwent-water, at Keswick, where it is joined by the Greta. It then pursues its course to Bassenthwaite and Cockermouth. At the former place it forms Bassenthwaite-water, and at the latter it receives the Cocker. After running about 33 miles and passing many pleasant seats and villages, it falls into the sea near Workington.

There are numerous streams of smaller size. The Caldew issues from the south-east side of Skiddaw and Caldbeck-fell, from whence it takes a northerly direction. At Halt-cliff Bridge it enters a subterraneous passage, in which it runs about four miles. The river emerges at Sebergham, then passes Rose Castle and Dalston, and after a course of about 20 miles, in which it puts in motion several corn and cotton mills, print works, &c., joins the Eden at Carlisle. The Peteril rises in the parish of Greystock, near Penrith-dock, runs by Plumpton, Barrock-lodge, Wreay, Woodside, Newbiggin-hall, and Upperby, and enters the Eden near Carlisle. The Irthing runs several miles in a southern direction between this county and Northumberland, passes Gilsland-spa, about a mile from which it enters Cumberland, then turns westward by the two Dentons, Naworth Castle, Lanercost, Walton-house, Irthington, and Edmond Castle. After a very winding course of about 13 miles in this county, in which it receives King, Cambeck, and several lesser brooks, it falls into the Eden near Newby, above which place it is joined by a small river called the Gelt, which rises in Croglin-fell. The Liddel rises in Scotland, and forms the boundary for about eight miles between that kingdom and Cumberland. It joins the Esk near the entrance of that river into the county. The Sark runs between Cumberland and Scotland for about six miles near Solway-moss. The Wampool rises in Brocklebank-fells, passes Crofton-hall, and at Dockray joins the Wiza, which springs near Rosley, and runs by Old Carlisle and Wigton. The Wampool runs past Glamblesby to the sea, which it enters near Kirkbride. The Waver has its origin in Brocklebank and Caldbeck fells, and takes a similar course to the æstuary. By diverting the channels of these two rivers near their termination, 4000 acres of land might be reclaimed at small expense. The Ellen rises from Caldbeck-fells, and passes by Ireby, Bolton, Aspatria, Ellenborough, and Nether-hall, and enters the sea at Maryport after a course of about 18 miles. The Cocker takes its rise near the black-lead mines, in Borrowdale, flows through the lakes of Buttermere and Crummock, unites with the stream of Lowes-water, and falls into the Derwent at Cockermouth. The Greta has its principal source in a curious lake or tarn on Saddleback. At Threlkeld it receives a stream from the vale of St. John and Thirlmere, and then runs to Keswick, near which place it joins the Derwent. The Eamont flows from the lake of Ullswater, which is partly situate in Cumberland and partly in Westmoreland. It divides the two counties in its course, passes Dalemian, Carlton-hall, and Brougham-hall, and joins the Lowther and the Eden, the former about a mile to the west, and the latter about five miles south-east of Penrith. The Duddon rises in Cumberland, near the junction of the county with Westmoreland and Lancashire, and in its course to the sea of about 20 miles forms the boundary between the first and last mentioned counties. A large tract of sand here seems also capable of being recovered from the sea. The Croglin rises on Thackthorn-fell, contributes to the beautiful and romantic scenery of Nunnery and Stafford-

hall, near which places it falls into the river Eden. The Nent rises in the south-east extremity of the parish of Alston, and joins the South Tyne near the town of Alston. The South Tyne has its source in a swamp or bog-ground about seven miles east by south from the summit of Cross-fell: it runs by Garrigill and Alston, and a little below the latter place enters Northumberland. The Tees rises in the same swamp, about a mile from the source of the South Tyne, and for nearly four miles forms the boundary between Cumberland and Westmoreland. Besides these, there are the Carn, which rises from King Harry; the Ehend (or End) from the lake of Ennerdale; the Irt, Mite, and Esk, and numberless small rivulets and brooks. The larger rivers abound with salmon, trout, brandling, and various other kinds of fish, and the smaller with trout and eels. Salmon fishing commences in the Eden, January 1st; in the Solway Frith and Esk, March 10th. It closes in all the Cumberland rivers on the 25th of September, except the Derwent, in which it continues from the 10th of February to the 10th of October. Salmon taken in the Eden is often sold to purchasers in London, Liverpool, and Manchester, particularly when it first comes in season. Game, especially grouse, is sent in great quantities to the south of England.

The ship canal from Carlisle to the Solway Frith is the only canal in the county. The Newcastle and Carlisle railroad, which was opened from Carlisle to Blenkinsop in July, 1836, (and not from Newcastle to the latter place in 1816, as is stated by a misprint in the article CARLISLE,) is the only railroad for the conveyance of goods and passengers: this railway and the Carlisle canal will complete the communication between the east and west seas. A survey is now making for lighting and buoys the Solway Frith, which will be a great advantage to its navigation; and floating-docks are about to be constructed at Port Carlisle, a new and flourishing little seaport at the junction of the canal with the Frith, from whence two steamers sail weekly to Liverpool. A railroad has lately (1837) been projected from Carlisle to Maryport, and nearly all the shares are taken. Two important turnpike-roads cross the county: one passes from east to west and the other from south to north; the latter is one of the principal roads between London and Glasgow and Edinburgh, and enters the county near Penrith, a market-town, 18 miles from Carlisle. It passes through that city, and then through Longtown, nine miles north of it, to Edinburgh; previously giving off a branch three miles north of Carlisle to Glasgow, by Gretna, which crosses the Esk by a cast-iron bridge. The road from east to west extends from Newcastle to Carlisle 56 miles, and from the latter place to Whitehaven 41 miles. It passes through Brampton, nine miles east of Carlisle: on the west, through Wigton, 11 miles, Allonby 11, Maryport 5, Workington 6, and Whitehaven 8 miles. There is a turnpike-road from Penrith to Alston 20 miles; and one also from the former place to Keswick 18 miles, from thence to Cockermouth 13, to Whitehaven 13 miles. From Wigton there is a road extending to Cockermouth 16 miles; one also to Keswick, through Ireby, 22 miles; and another to Penrith, through Sebergham, 21 miles. From Whitehaven to Duddon Sands, on the road to Ulverston, are Egremont, 5 miles, Calderbridge 4, Ravenglass 7, Bootle 6, Whicham 4, and Duddon-bridge 6 miles. A turnpike-road extends from Brampton to Longtown 11 miles: there is one also from Keswick to Ambleside 16 miles, which passes through a pleasant and picturesque country.

Geological Character.—Cumberland is situated in the red marl district, which lines the western base of the great chain of mountains denominated the British Apennines, or the Back-bone of England extending from the Tweed into Derbyshire. This district extends in a northerly direction from the north-west corner of the Cheshire plain, along the western coast of Lancashire, into Cumberland and the south of Dumfriesshire. White and red sandstone, but chiefly the latter, may be found almost everywhere within the limits described. St. Bees' Head is entirely composed of new red sandstone. At Whitehaven the red marl formation is seen reposing on the coal formation, covered by the marl-beds containing gypsum: the same formation is seen filling up the great space between the Cumberland group of mountains and the British Apennines at Cross-fell. At Newbiggin and Coat-hill, near Carlisle, gypsum is found lying in red argillaceous marl, between two strata of sandstone: the former quarry is much wrought, and gypsum is exported in great quantities from Carlisle.

At Barrock, three miles to the south of Newbiggin, is a large rock of greenstone, much used on the public roads. A trap or basaltic rock is also observed near Berrier, at the hill called Binsey, and also on the north side of the Derwent, near Cockermouth. The primitive and transition group of the Cumbrian mountains consist of granite, sienite, hypersthene, greenstone, slate, old red sandstone, and mountain limestone. A grey kind of granite is found in the bed of the Caldew, on the north-east side of Skiddaw; and also in a branch of the river Greta, between Skiddaw and Saddleback. Sienite is met with at Irton-fell, Muncaster-fell, and Nether Wasdale; and hypersthene, in conjunction with quartz and felspar, commonly referred to the class of sienite, at Carrock-fell. A reddish felspar porphyry is found on Ambroth-fell and on both sides of St. John's Vale, near Keswick. Varieties of slate, intersected by dykes of trap or greenstone, constitute the great mass of Skiddaw, Saddleback, and the adjacent mountains. The common stone of the Keswick district is called blue rag, schistic earth, or whintin. At Borrowdale, Eskdale, and Patterdale, Scaw-fell and Helvellyn, and some adjacent places, grey slate is associated with hornstone, amygdaloid and argillaceous porphyry, constituting the towering crags and lofty precipices of these districts. Many of the cataracts of the lakes fall over rocks of this description. Quartz, garnets, calcareous spar, chlorite, epidote, and sometimes agate, opal, and chalcedony, are found in these rocks. The old red sandstone occurs near Melmerby. Metalliferous limestone, productive of lead ores, abounds in the mountains of the east, and also of the west of the county. Boulder-stones, from the granite rocks of Dumfriesshire, occur in the eastern parts of the county; and some, of the granite of Caldew and of the sienite of Carrock, near Carlisle. Shap-fell boulders are found on the shores of the Solway Frith; and boulders from the sienite of Buttermere and Ennerdale, on the west coast of the county.

The minerals are silver, copper, lead, iron, plumbago, limestone, and coal. The principal lead-mines are situated at Alston, and are almost exclusively the property of Greenwich Hospital, to which institution they were appropriated by act of parliament on the attainder of the earl of Derwent-water. The number of mines now working is about 40, some of which are very productive. Silver and copper are found in some of the mines in the same veins with the lead-ore. Silver and lead are at present got in great abundance at Greenside and Eagle-cragg in Patterdale. Veins of lead-ore have been found and worked between Skiddaw and Saddleback, in Buttermere, Newlands, and Thornthwaite. There are copper-mines at Alston, Caldbeck, and at Wythburn. There is one also below the level of Derwent-water, and another in the parish of Lowes-water. A very rich vein of gold is said to have been discovered at Newlands by a German, in the time of Queen Elizabeth, but the working was discontinued in consequence of a law-suit between that queen and the earl of Northumberland, then the lord of the manor of Derwent-fells. Iron-ore is raised in great abundance near Egremont; the thickness of the band of ore, which is hard solid metal, is said to be between 24 and 25 feet. The quantity of iron-ore shipped from Ulverston and Barrow is very great: 300 carts of ore are taken daily from Lindale to Barrow for exportation. The ore of this county produces upwards of double the quantity of metal that is got from iron-ore in general. Coal is worked to a large amount at Whitehaven, Workington, and in the vicinity of Maryport, from whence it is exported to Ireland and the west of Scotland. The eastern part of the county also abounds in coal, particularly Tindale-fell, Talkin, and Blenkinsop, which produce the chief supply for Carlisle, Brampton, Penrith, and the intermediate country. Some of this coal is now exported at Port Carlisle to Ireland and Scotland. There are collieries at Gilerux, Arkleby, Oughterside, Bolton, and Hower-hill. Limestone is very abundant in many parts of the county. In some places it is burnt in great quantities for exportation, particularly to the west of Scotland. At Catlands the limestone is overlaid by the coal measures on all sides. Plumbago, or black lead is found, in irregular masses in a rock of grey felspar porphyry at Borrowdale near Keswick. This mine was formerly opened at stated periods, to prevent a superabundance in the market; but latterly, on account of the demand being greater, and the mine less productive, it has been worked for a succession of years. A little cobalt has been got at Newlands, and antimony near Bassen-

thwaite. Lapis calaminaris, small quantities of manganese, galena, iron pyrites, and spar of various kinds and of different colours and forms, are found in several places. Slate of a pale blue colour and of the finest quality is plentiful in Cumberland, particularly in the neighbourhood of Keswick and Ullswater.

Climate.—In consequence of the great extent of coast and the numerous high mountains, the climate is various. The mountains and high grounds are cold and piercing; the lower parts are mild and temperate: the whole county is exposed to wet and variable weather, particularly in the autumn, yet it is healthy, and many instances of longevity occur. The oldest inhabitant on record is John Taylor, of Garrigill, who died in 1772, aged 135 years. Mr. R. Bowman, of Irthington, another extraordinary instance, died June 13th, 1823, in the 118th year of his age; and it was a singular coincidence, that the oldest tree in Cumberland, an oak, of which there is an authentic account of its standing 600 years in Wragmire-moss, Inglewood Forest, fell from natural decay on the same day. With regard to the salubrity of the climate, the results of the observations made at Carlisle in 1787 by the late Dr. Heysham, are said to represent the lowest mortality ever recorded under any circumstances. How far that city may deserve this high character, since it has become a manufacturing town, has not been ascertained.

The annual mean quantity of rain at Carlisle is about 30 inches; at Wigton, 34 inches; at Whitehaven, 50 inches; and at Keswick, 68 inches. April on an average is the driest month of the year. July, August, September, and October, are wet months: about twice as much rain falls in each of these months as in the month of April; and about one-third less rain falls in the first six months of the year than in the last six months.

Agriculture, &c.—The soil of this county varies much; it often differs in the same parish, and sometimes even in the same field. The mountainous districts are bleak and barren; the most prevalent soil being mossy or dry gravel covered with heath. They are chiefly used as sheep pastures and preserves for moor-game. Some good land of dry brown loam is found in the valleys, and on the sides of some of the smaller mountains. On the margins of the rivers is much valuable ground, consisting of rich brown loam. On the coast the soil is light sandy or gravel. The lowland country, extending from Carlisle in every direction for many miles, is fertile, though a considerable portion of it is cold wet loam and black peat earth: this land has latterly been much improved by draining, which is now carried to a very great extent. There is a good deal of fertile clayey loam in the neighbourhood of Wigton. Sand and light loam prevail near Brampton, and likewise near Penrith. In the west of the county there is some wet soil on a clay bottom, and also some hazel mould. The subsoil in many places is a wet steril clay. About two-thirds of the county are held under lords of manors, by what is called customary tenure, a species of feudal oppression which subjects them to the payment of certain annual rents and fines, and of arbitrary fines and heriots, with other boons and services, on alienation, or on the death of the lord or tenant. A part of the county is freehold, a part leasehold under the bishop of Carlisle, the dean and chapter of Carlisle and others, and a small part is copyhold. The tithes are generally paid in kind, and have been great obstacles to improvement. The agriculture of the county has improved considerably within the last thirty years, and great quantities of corn and produce of various kinds are now exported. The chief exports are from Port Carlisle, Whitehaven, Workington, and Maryport, and consist of cattle, sheep, poultry, grain, potatoes, butter, bacon, &c. The land being divided into small farms, the dairies are necessarily on a small scale, though their produce is excellent, and bears a high price in the market. Many of the farms do not exceed 100 acres, and some are not more than 30 or 50 acres. They are possessed on verbal or written contracts, or on very short leases. There are very few farms let on leases of 14 or 21 years. Many persons, provincially called *lairds* or *statesmen*, occupy their own lands, which, in some instances, have passed for several centuries in a regular line of descent in the same families. Some of these persons have an air of independence which forms a peculiar trait in their character. A small part of the land, in some places, lies in open town fields, which cannot have the benefit of the common improvement in husbandry. This

land usually lies in ridges of variable width, upon which the grazing cattle that are herded do frequent injuries to the crops. In other places there are certain common lands that are annually stinted with cattle and horses, on a fixed day, by the owners or occupiers. These lands are always in grass. In high and mountainous districts the chief object of the farmers is their sheep stock, though of late years a considerable quantity of high-lying land has been brought into cultivation, which, on account of the steep declivities, is very laborious. In some of these places the climate is cold, the corn backward, and the harvest late. The valleys and low ground are cultivated chiefly for grain, and produce excellent crops of wheat, barley, and oats; these are alternated with turnips and potatoes or fallow. Some of the lands that are well supplied with water are kept as meadows or pastures for dairies, and for rearing and fattening cattle. Although the Cumberland farmers are in general good agriculturists, and have their lands clean and in good condition, many of them take too many white crops, particularly on new inclosures, which impoverish the land; they also keep their lands too long in tillage, without renewing by laying down.

Candlemas is the usual time for entering upon farms, and the rents are paid half yearly, in even and equal portions, at Lammas and Candlemas. The buildings and premises, in many instances, are delivered in good repair to the farmer, who at his own cost amends and keeps them in sufficient repair, except the roof and main timbers, which are repaired by the landlord. In other instances, the tenant lends all materials wanted for repairs, and finds meat and lodging to the work-people. The landlord pays the wages of the work-people, and the cost of the materials. The modern farm-houses and buildings have a handsome appearance, being generally built of stone, and roofed with blue slate. The old farm-buildings and cottages have clay or mud walls, and are thatched with straw. The following rotation of crops is often adopted on good soils. After the land has been in grass two or three years, it is ploughed up, and one crop, and in a few instances two crops of oats, are taken, then a fallow, or green crop of turnips or potatoes, which is followed by a crop of wheat, and this last by a crop of barley, when the land is laid down with clover and grass seeds. A crop of hay is taken the ensuing year, and then the land is kept in grass. On poor and light soils, only one white crop is taken after a green crop or fallow, and the land is laid down with seeds. Beans and peas are occasionally cultivated, but less frequently than in the south of England. The farmer cuts almost every sort of grain with the sickle. He does not sell or dispose of any hay or straw, but consumes them upon the farm; he keeps up his usual quantity of stock until the end of his term, and leaves all the manure, ashes, and compost, that may arise or be made upon the premises, for the benefit of the succeeding tenant. At the expiration of the term, he is allowed to sell or remove the remainder of his crop. He does not plough or convert into tillage more than one half of the arable lands in any one year, except some small part for soiling. Such part as shall be mown twice he covers with manure, compost, or ashes. When the land is in fallow for wheat, and also before it is sown with barley, and with clover seeds and grass seeds, it is well manured. In the former state, it has about twenty, and in the latter, ten cart loads of manure per acre. The quantity of clover seeds is usually six pounds of red and three pounds of white clover seeds to each acre. The farmer does not depasture any horses or cattle upon the seeds after the barley is reaped. In the last year of his term he summer-fallows, plants with potatoes or sows with turnip seeds a certain number of acres (perhaps a tenth part of the arable land), which he is required to manure well. The potatoes or turnips are pulled up and carried away from the land on or about the tenth of October preceding the expiration of the term, after which time the succeeding tenant is at liberty to enter upon this land, and to plough, manure, and sow it with wheat or other grain, and also to take the manure then upon the premises for the manuring of the land. The farmer is required not to do any injury to this wheat land by depasturing horses, cattle, or sheep upon it. Hay, straw, and clover are sold by some farmers in the vicinity of market-towns, from which ashes and manure are taken to the farms. When land is drained with tiles, the landlord, in many instances, finds the tiles only; in others, he is also at the expense of cutting and making the drains, and the tenant lends the

tiles, sets them, and fills and covers the drains in a proper and satisfactory manner. Lime is much used in many places, and lately bone-dust has been employed by a few persons. The variety of oats called potatoe-oats, which is now so generally cultivated in every part of the kingdom, was first discovered by a farm-servant of Mr. Jackson of Arkleby, in this county, in 1778. The horses in common use are light and of rather small size. Waggoners are rarely, if ever, employed by the farmer. A single horse-cart, and a pair of horses to a plough are in general use. Several improved implements of husbandry have been lately adopted. Scufflers are used by a few persons. Thrashing-machines and drills of various kinds are now become common on the larger farms. There is a great variety of cattle and sheep. Many persons have the improved short-horned cattle; some have galloways; and a few prefer cattle of the long-horned breed. The last, which was, not many years ago, the most common, is now superseded by the two former. A peculiar breed of sheep, called *Herdwicks*, from their being farmed out to herds at a yearly sum, is met with on the mountains, at the head of the Duddon and Esk rivers. The ewes and wethers, and many of the tups are polled; their faces and legs speckled, and the wool short and coarse. They are lively and hardy little animals. The tups are in great request to improve the hardiness of other flocks. There are four agricultural societies and several cattle shows in the county, which give a stimulus to agriculture, and encourage improvements in the breed of live stock, by distributing rewards and premiums. The late Mr. Curwen of Workington-hall deserves mention as one of the greatest promoters of agriculture in Cumberland. At Carlisle, Whitehaven, and Penrith, are horticultural and floral societies, which are well supported, and are of service in exciting attention to the cultivation of fruits and flowers. About ten acres of boggy land near Tarn Wadling are kept exclusively for the production of cranberries, which are uncommonly fine and much esteemed.

Cumberland farmers are a temperate, social, and intelligent people. They are strong and robust, and generally very frugal and industrious. They rise early and labour hard. They wear clogs, and coarse plain dresses, take oatmeal porridge to breakfast, and often bacon and salt meat to dinner. Their bread is commonly made of barley, or of barley and rye. In some places, oaten bread formed into thin cakes, and *scons*, or unleavened cakes, are chiefly used. Milk, potatoes, and skimmed milk cheese are universally consumed. Tea, wheat bread, and animal food are now fast superseding these simple articles of diet. About half a century ago they wore *kelt* cloth, which was of a grey colour and home spun, and hence the name of *grey-coats*, which the Cumbrians received. At present home-spun clothes are only worn by a few persons in the mountain districts. The Cumbrians have been undeservedly said to be litigious, which has arisen from the minute division of property and extensive commons occasioning frequent law-suits. The peasantry pay great attention to the education of their children. In some rural districts, where the quarter pay is not adequate to support the master, he is allowed a *whittle-gate*, or the privilege of dining in rotation with the parents of his pupils—a custom which formerly prevailed also in some places with the poorer clergy. Farm-servants are hired at Whitsuntide and Martinmas, at the fairs held at the larger market-towns. They stand in the market-places, and are distinguished by having a piece of straw or green branch in their mouths. Men get, for half a year, which is the general term, from 4*l.* to 8*l.*; and women from 2*l.* to 4*l.* After the hiring is over, the remainder of the day and of the evening are dedicated to mirth and festivity. Cumbrian peasantry have various festive meetings, called the *kirn*, or harvest-home, sheep-shearing, merry nights, and upshots. Bridewains and bidden-weddings are still held in some parts of the county. Wrestling, running, and leaping are the favourite amusements and athletic exercises of the peasantry.

The following are the principal fairs in Cumberland. Noted horse-fairs are held at Cockermouth, February 18th; Wigton, February 20th; and at Longtown, Thursday before Whitsuntide. Fairs for cattle and horses, at Rosley, Whit-Monday, and continued every Monday fortnight until Michaelmas; Abbey-Holme, Thursday before Whitsuntide, and October 29th; Carlisle, August 26th and September 19th; Hesketh-New-market, the first Friday in May, and continued every fortnight afterwards until Whitsuntide. Ireby,

February 21; Aiston, last Thursday in May, Friday before September 27, and first Thursday in November. Fairs for cattle, Wigton, April 5; Brampton, the second Wednesday after Whitsuntide, and the second Wednesday in September, April 20, and October 23; Bootle, April 5 and September 25; Egremont, the third Friday in May, and September 18; Workington, May 18 and October 18; Keswick, the first Thursday in May, and every Thursday fortnight for six weeks, the Saturday before Whitsuntide, and on the Saturday nearest the festivals of St. Michael and St. Martin, or on the festivals if they happen on Saturday; the Martinmas fair is noted also for rams and cheese. Sheep-fairs are held at Low-wood-Nook, August 20; Uldale, August 29; Nether Wasdale, first Monday in September; Borrowdale, first Wednesday in September; Threlkeld, first Thursday in September; Ennerdale, second Tuesday in September; Ireby, October 18; Hesketh-New-market, last Thursday in August, and second Thursday in October; Lowes-water, second Friday in September; and Newlands, the last Friday in September.

Cumberland has four newspapers; two are published at Carlisle, and two at Whitehaven weekly.

Divisions, Towns, &c.—This county is divided into six wards, or hundreds, known by the names of Allerdale above Derwent, Allerdale below Derwent, Derwent, Cumberland, Leath, and Eskdale wards. It contains one city, Carlisle; the parliamentary boroughs of Cockermouth and Whitehaven, and 17 market-towns.

Allerdale above Derwent is situate in the south-west of Cumberland, comprehending many of the mountains and lakes, as well as the principal seaports. It contains six market-towns: Whitehaven, Workington, Harrington, Egremont, Ravenglass, and Bootle.

Whitehaven is a well-built seaport of considerable importance, situate in a creek on the western shore. In the reign of Queen Elizabeth it was only a small fishing village, containing six houses. In 1831 the township population amounted to 11,393, and the parish of St. Bees, including Whitehaven, contained 20,012 inhabitants. The streets are regular, generally spacious, and cut each other at right angles. In the vicinity of the town and also immediately under it are extensive collieries. In the year 1791 18 houses were injured, and the inhabitants greatly alarmed, by the falling in of some old coal works. Some of the collieries are wrought to the extent of two miles under the sea, so that the water above them is of sufficient depth for ships of great burden. Some of the coal-seams are 8 and some 11 feet thick. From the pits to the quays are railways and wooden galleries, at the end of which the contents of the waggons are shot down large wooden trunks called hurries into the holds of the vessels. The harbour is commodious: some additions lately made have not answered, and are about to be altered. Several improvements in the harbour entrance are contemplated. A narrow vale extending to the village of St. Bees, supposed to have been formerly occupied by the sea, might be cut through and made navigable for large vessels at a moderate expense; but this project seems to be lost sight of. There are four batteries for the protection of the port, which were repaired after the hostile attack of the notorious Paul Jones in 1771, but are now in a state of decay, being no longer necessary. At the entrance of the harbour are two lighthouses. The manufactures are of sail-cloth, linen, check, earthenware, candles, soap, &c. There are also large roperies and yards for ship-building. The trade chiefly consists in the exportation of coal, lime, iron, freestone, gypsum, and grain, and importations of West Indian, American, and Baltic produce. Tea has lately been imported direct from China. Upwards of 200 vessels are employed in the export of coal. Steam vessels sail weekly between this port and Liverpool, and occasionally to Dublin, Isle of Man, and Dumfries. There are three churches or chapels; seven meeting-houses for religious worship; marine, national, Sunday, and other schools; an infirmary; house of correction; mechanics' institution; custom-house; theatre; salt-water baths; workhouse; public office; news-room and library. There is a neat market-house in a handsome area. The market-days are Tuesday, Thursday, and Saturday—the principal market is on Thursday. A fair or great market, August 12th, has been nearly discontinued. At the approach from the north is a handsome portico of red freestone, above which is a railway for coal waggons; and at the S. E. end of the town is an elegant mansion of the earl of Lons-

dale, called the Castle. Dr. Brownrigg, an eminent chemist and mineralogist, who died in 1800, practised medicine here. Whitehaven sends one member to parliament. In 1836 the number of voters registered was 476. A few miles from the town are the clerical institution and the free-school of St. Bees (the latter founded by Archbishop Grindall, a native of the parish), and the lofty promontory of St. Bees' Head, upon which is a lighthouse.

Aggregate amount of Shipping and Tonnage belonging to the Ports of Cumberland.

PORTS.	April, 1810.		January, 1822.		January, 1828.		January, 1836.

Workington stands on the south bank of the Derwent, which is navigable for ships of 400 tons burden, and falls into the sea about a mile distant. Coals constitute the chief export; timber, cattle, bar-iron, and flax, the chief imports. Nearly 100 vessels are employed in the coal trade to Ireland. Sail-cloth and cordage are the principal manufactures. Ship-building is carried on to a considerable extent. A few years ago a patent Leghorn manufactory, and a joint-stock banking company were established. There are two churches; five chapels for dissenters; a national, an infant, and Sunday schools; subscription library; dispensary; assembly-room; theatre, and custom-house. Township population in 1831, 6415. The market-days are Wednesday and Saturday—on the former day is the principal market. It is remarkable that this is the only large market-town in the county at present (1837) not lighted with gas.

Workington-hall, on the east side of the town, afforded an asylum to Mary Queen of Scots, when she landed at Workington. At Seaton, a little above Workington, are extensive iron-works, and the antique ruins of Borough walls.

Harrington is a small flourishing seaport between Whitehaven and Workington. The harbour is well constructed, and the trade gradually increasing. Coal is exported from this place to Ireland, and lime to Scotland. In the former trade upwards of 40 vessels are employed, and in the latter are several hundred sloops. Here are two yards for ship-building, a ropery, and a vitriol and copperas manufactory. The parish church is a plain structure, without a tower. There are two Methodist chapels, a Lancasterian school, and a clothing society. Parish population in 1831, 1758. This place and the manor gave name to the antient and baronial family of Harrington, and was possessed by Lady Jane Grey. Iron-stone and fire-clay are found in the vicinity: about 2000 tons of the former are annually exported.

Egremont is a neat little town five miles from Whitehaven, and about two miles from the sea. It is said to have been an antient borough, which was disfranchised at its own petition to avoid the expense of representation in parliament. The manufactories are of check, linen, paper, leather, and sail-cloth. There are a parish church, Methodist meeting-house, a national school, and a poor-house. Saturday is the market-day. Parish population in 1831, 1741, which is the same number as returned by the census of 1821. It is from this place that the earl of Egremont takes his title. On the west side of the town are the ruins of an old castle, supposed to be coeval with the entry of the Normans into Britain. In the parish are some productive iron-mines. The seats of Gill-foot and Hale-hall are near to the town. Calder-abbey and Ponsonby-hall are at a short distance.

Ravenglass is a small market-town and seaport, situated at the confluence of the Esk, Mite, and Irt. There is a fair held here, with very singular customs and ceremonies, August 5th. It has a market on Friday; a large workhouse, and an endowed school. Near this place are Mun-

caster-house, and the ruins of Walls Castle. Oysters abound on the coast between this town and

Bootle, which is one of the smallest market-towns in the kingdom, has a very antient church, an independent chapel, and two endowed schools. Parish population in 1831, 737. A small weekly market on Saturday. Near it are the ruins of Barnscar, supposed by some to have been a British and by others a Danish city.

Derwent division consists of a portion of the county taken from the wards of Allerdale above and below Derwent, by an order of the magistrates made at the quarter-sessions of 1833. It contains most of the lakes, the borough of Cockermouth, for which see article COCKERMOUTH, and the market-towns of Maryport and Keswick.

Maryport is a neat modern seaport on the river Ellen. In 1750 there was only one house on the present site of the town. The trade and manufacture connected with ship-building are flourishing. A very handsome market-house has been lately erected, and a new harbour is now building. The vessels belonging to the port are about 130 in number, and are chiefly employed in exporting coal, lime, and stone, and in importing cattle, timber, flax, and iron. A steamer sails weekly to Liverpool in the winter, and also to the Isle of Man and Dublin in the summer season. In the town are a chapel of ease, five dissenting places of worship, a national school, and a school of industry. Chapelry population in 1831, 3877. Market-day, Friday. In the vicinity are the mansions of Nether-hall and Unerigg, and the village of Ellenborough, from which the late Lord Chief Justice Law derived his title. At a short distance are Tallantire-hall and Dovenby-hall.

Keswick is a small and pleasant town, standing on the banks of the Greta, near the lake of Derwent-water. It is much resorted to by visitors to the lakes, and is celebrated for the beautiful and romantic scenery in its vicinity. The parish church of Crosthwaite is about half a mile from Keswick. John Marshall, Esq. is now erecting a new church on the opposite side of the town. Char is potted here, and sent to London, and to almost every part of the kingdom. This place is also noted for black-lead pencils. Woollen goods, fancy waistcoatings, and edge-tools are manufactured here. The Town-hall is a small edifice. There are two good museums; a national school, and a Sunday-school; a free-school, and workhouse. Township population in 1831, 2159. There is a weekly market on Saturday. Sir John Banks, chief justice of the Common Pleas, was born at Keswick; and on his death, in 1642, bequeathed property worth upwards of 200*l.* per annum to the poor of his native town. Robert Southey, the present poet-laureat, resides at Greta-hall near Keswick.

Allerdale below Derwent comprises a part of the west of the county, and contains four very small market-towns, Allonby, Abbey Holme, Ireby, and Heskett-New-market.

Allonby is pleasantly situated on the sea-shore, and is much frequented for bathing. It has a chapel of ease; a school with a small endowment, and a Friends' meeting-house. A good building, containing warm and cold baths, has been lately erected. The inhabitants are chiefly engaged in fishing. Chapelry population in 1831, 783. Market-day, Saturday. Captain Huddart, who constructed the much esteemed nautical charts, was a native of Allonby, where he worked some time as a mechanic and also as a fisherman, and gradually advanced to be captain in the East India service, and elder brother of the Trinity-house, London. Hayton-castle and Brayton-house are situated a short distance from Allonby.

Abbey-Holme, about six miles from Wigton, has a small market on Saturday, in summer only. Quarter population in 1831, 861; parish population 3056. In this parish was an abbey of Cistercians, said to have been founded about the year 1150, by Prince Henry, son of David, king of Scotland; part of the ruins is remaining, and has been converted into the parish church. In the reigns of Edward I. and Edward II. the abbots of this religious house were summoned to several parliaments. Woolsty-castle, of which there is now scarcely a vestige, was a strong fortress. Near it is the famous Green-Row academy.

Ireby is a very old town, having had a market granted to it 600 years ago, but so little benefit has it derived from the grant, that in 1831 the entire parish contained only 449 inhabitants. The church is small. The salary of the present clergyman, who has filled the office above half a century, was only 25*l.* a year until recently augmented by

Queen Anne's Bounty. The school has a small endowment. Clea-hall, Whitefield-house, and Snittlegarth, are in this neighbourhood.

Heskett-New-market is a small but neat town, situate on the banks of the Caldew, 9 miles south of Wigton and 13 south-west of Carlisle. It has a weekly market on Friday.

Leath Ward comprises the south and south-east parts of the county, and has within its limits an inexhaustible store of mineral treasures. It contains three market-towns, Penrith, Kirkoswald, and Alston.

Penrith is an antient and well-built town, 283 miles from London, situate in a fine fertile vale at the south extremity of Inglewood forest. It has no manufactories of consequence. The church is a neat and elegant structure on one of its walls is the following inscription: 'A. D. 1598 ex gravi peste quæ regionibus hisce incubuit obierunt apud Penrith 2260, Kendal 2500, Richmond 2200, Carlisle 1196. Posterì, avertite vos et vivite.' In the church-yard is an antient monument, consisting of two pyramidal stones twelve feet high, called the Giant's Grave. Here are six dissenting chapels; a free grammar-school; several charity-schools, and a house of correction. Penrith was several times pillaged and twice burned by the Scots in the turbulent times that preceded the union. On an eminence to the west are the ruins of a castle which was inhabited by Richard III. when duke of Gloucester, and was destroyed in the time of the Commonwealth. The Beacon stands on a high mount, about a mile from the town, and commands a view of the country for more than 100 miles in circumference. Parish population in 1831, 6059. Market-day, Tuesday. Sir Richard Hutton, judge of the Common Pleas, was a native of Penrith. In its vicinity in this county are the following mansions: Eden-hall, Carlton-hall, Hutton-hall, Skirsgill, Dalemmain, and Hallsteads. Greystoke-castle and Dacre-castle are each about six miles distant. The former was the antient seat of the duke of Norfolk; the latter is supposed to have been the original mansion of the Dacre family, and is now converted into a farmhouse.

Kirkoswald is situated in a beautiful vale on the Eden, fifteen miles from Carlisle. The church was dedicated to St. Oswald, the celebrated martyr and king of Northumberland; and in the reign of King John belonged to Hugh de Morville, one of the murderers of Thomas à Becket. Near the town are the remains of an antient castle, and a mansion called the College. A paper-mill and a mill for carding and spinning wool are the only manufactories. Township population in 1831, 768. A weekly market on Thursday, and great markets on Thursday before Whitsuntide, and August 1st. Caleb Threlkeld, a famous botanist, was born here in 1675. John Aglionby, a learned divine, who had a considerable hand in the present translation of the New Testament, and Dr. Leake, the founder of the Westminster Lying-in Hospital, were natives of the adjoining parish of Ainstable. A peculiar wind, called the *Helmwind*, sometimes blows with great fury in this part of the country. It is believed by some persons to be an electrical phenomenon.

Alston is situate in a wild and mountainous district, on the confines of Northumberland, near the Tyne, and has valuable lead-mines in its vicinity; a good modern church, four chapels for dissenters, a national school, grammar-school, and subscription library. Parish population in 1831, 5244. Market-day, Saturday. The lead-mines are let to the London Lead Company and several other persons, who pay one-fifth part of the ore raised for rent. On an average, the mines produce 7600 tons of lead annually, and from every ton about thirteen ounces of silver are extracted. Copper is also worked in several of the mines.

Cumberland Ward is situate in the north-west. It is the most fertile and most central ward, and contains the city of Carlisle (an account of which may be found under the article CARLISLE), and the market-town of

Wigton, which is a well-built town, seated near the Wiza, in a beautiful part of the county. It was burned by the Scots in the fourteenth century, when they plundered the monastery of Holm Cultram. The principal manufactures are checks, gingham, and calicoes. Here are gas-works, extensive print-works, and a dyeing establishment. In 1725 an hospital was founded here for six indigent widows of episcopal clergymen. In 1788 a handsome new church was built. The Quakers, Independents, and Methodists have neat and commodious chapels. A Catholic chapel is

now building. There are also an endowed grammar-school, a news-room, and a parochial library. Township population in 1831, 4885. The market is held on Tuesday; a great market on St. Thomas's Day. The Rev. John Brown, a distinguished writer, author of 'Barbarossa,' &c., was educated at Wigton. About one mile south of Wigton are the remains of a Roman station, called Old Carlisle. At Brookfield, one mile to the west, is a large Quakers' academy.

Eskdale Ward is the most northern division; being situated on the borders of Scotland, the remains of numerous towers, castles, forts, and encampments are scattered over it. This ward contains only two market-towns, Brampton and Longtown.

Brampton is a very antient town, and has a weekly market on Wednesday. The new chapel was consecrated in 1789, and greatly enlarged and improved in 1827. A new town-hall, of an octagonal form, and a national school, were erected by the earl of Carlisle in 1817. Gas-works are now being established. Here are four dissenting chapels, three Sunday schools, a grammar-school, and an infant school. The old church, a part only of which is remaining, is situated a mile and a half from the town, on an eminence near the village of Irthington. The principal manufactures are the weaving of checks and gingham for the Carlisle manufacturers, some of whom have large establishments at Warwick-bridge, Carlisle, and Dalston. Township population in 1831, 2842. The Mote is a natural mount at the east end of the town, probably an antient fort. It rises 360 feet above the level of the streets, and commands an extensive prospect. Upon a rock on the banks of the Gelt, one mile and a half to the south, a Roman inscription is still legible. About two miles to the east are Lanercost-abbey and Naworth-castle. The former was founded in 1116, and exhibits some beautiful ruins: the latter was a strong fortress, and the baronial mansion of the lords of Gilsland; it is now the property and occasional residence of the earl of Carlisle. The seats in the neighbourhood are Walton-house, Edmond-castle, and Stone-house. Gilsland Spa is a much frequented watering-place on the banks of the Irthing, about nine miles distant. The parish of Brampton gave birth to Dr. Guy Carlton, bishop of Bristol and afterwards of Chichester, and to James Wallace, Esq., attorney-general, father of the present Lord Wallace.

Longtown is a modern town on the borders of Scotland, in the parish of Arthuret, which parish in 1831 contained 2053 inhabitants. The streets are regular and spacious. Thursday is the market-day. Cranberries in the season are brought to this market in great quantities from the moors of Scotland. On Monday a market is held for bacon and butter, in which articles there is an extensive trade. Arthuret church, a very elegant Gothic structure, about half a mile distant, was built in 1609. In the town are a Presbyterian meeting-house and two charity-schools. Netherby is pleasantly situated on the banks of the Esk, about two miles from Longtown. Liddel Strength, the site of an antient castle, is about four miles distant.

Divisions for ecclesiastical and legal purposes.—The whole of the county is in the diocese of Carlisle, with the exception of the ward of Allerdale-above-Derwent, in the diocese of Chester, and the parish of Alston, in that of Durham. The gross yearly value of the see may be estimated, upon an average of seven years, at 3000*l*. The commissioners appointed to consider the state of the dioceses in England and Wales recommend that the sees of Carlisle and Sodor and Man be united; and that the diocese consist of the present diocese of Carlisle, of those parts of Cumberland and Westmoreland which are now in the diocese of Chester, of the deanery of Furness and Cartmel, in the county of Lancaster, of the parish of Alston, and of the Isle of Man. An act for carrying into effect the reports of the commissioners was passed in the session of parliament, 1836.

There are 3 deaneries, Carlisle, Penrith, and Wigton; 1 archdeaconry; 104 parishes; 400 townships; 41 rectories; 28 vicarages; 59 perpetual curacies and chapelries; and 7 small extraparochial places and hamlets. The Roman Catholics have 6 chapels; the Independents upwards of 20; the Church of Scotland 7, and the Secession 7; the Quakers about 20; the Antipædobaptists 6; and the Methodists, comprising the Wesleyans, primitive and reform, upwards of 70. The corporation of the dean and chapter of Carlisle consists of the dean, 4 prebendaries, and

6 minor canons. The surplus revenue, after the yearly payments and temporary charges, amounts, on an average of seven years, to 3510*l*., which sum is divided into six equal parts, two of which go to the dean, and the remainder equally among the four prebendaries. Houses are also assigned for their residences, which they respectively occupy, and are bound to keep in repair.

Cumberland is comprehended in the province of York, and in the northern circuit. The assizes are held at Carlisle twice a year. The quarter-sessions are held twice at Carlisle and twice at Cockermouth annually; the Easter and Michaelmas sessions at the latter place, and the Midsummer and Christmas at the former, each commencing on Tuesday. The county returns four members to parliament (two having been added by the Reform Act); two for the eastern division, which includes Cumberland, Leath, and Eskdale Wards, and two for the western division, comprising the wards of Allerdale-above-Derwent, Derwent, and Allerdale-below-Derwent. Carlisle sends two members, the borough of Cockermouth two, and Whitehaven one (the last also given by the Reform Act). The members for Carlisle and the eastern division are elected at Carlisle; the members for Cockermouth and the western division at Cockermouth; and the member for Whitehaven at Whitehaven. The polling-stations for the eastern division are Carlisle, Brampton, Wigton, Penrith, and Alston. The number of voters by the registration of 1836 was 4638. The polling-stations for the western division are Cockermouth, Aspatria, Keswick, Bootle, and Egremont: the number of voters registered in 1836 was 4437. The number for the borough of Carlisle in 1836—freemen, 328, householders, 684: total, 1012.

History and Antiquities.—The earliest inhabitants of Cumberland of whom we have any account, were the Brigantes, a bold and warlike people, conquered by the Romans about A.D. 121, when the famous Roman or Picts' Wall was erected by Hadrian, to prevent the ravages of the Caledonians, who bore an inveterate hatred to the Romans. This barrier was formed of earth, and connected a chain of forts erected by Agricola in 78. being found insufficient, Severus, in 210, built one of stone, 73 miles in length, from near the mouth of the Tyne to the Solway Frith. The last was strengthened by an outward ditch, and guarded by towers and a chain of forts and stations. Remains of both walls, but particularly of that of Severus, may still be traced in several places. At a very early period, the inhabitants, who were the true and genuine Britons, were called Cumbri: and hence probably the name of the district, Cumberland. In almost every part of the county are remains of British and Roman antiquities. About three miles from Kirkoswald is a Druidical temple, consisting of a circle of sixty-seven unhewn stones, called Long Meg and her Daughters. Another and more entire circle of stones is situated a mile and a half south-east of Keswick. This county has been a perfect magazine of Roman antiquities. The remains of Roman garrisons or stations are still distinctly observable at Maryport, Old Carlisle, Old Penrith, and Bewcastle. Several altars, inscriptions, coins, instruments, utensils, &c. have been discovered at these places. After the retreat of the Romans, the country was laid waste and the city of Carlisle reduced to a complete state of ruin by the Scots and Picts. The country had also to endure the ravages of the Danes. During the Saxon Heptarchy it was joined to the kingdom of Northumberland, but was governed by its own chieftain under what was called the Danish law, until the Norman Conquest. In 945 Cumberland was granted to Malcolm, king of Scotland, and was for a long time the scene of war and bloodshed between the two crowns, being sometimes under the dominion of the kings of England and sometimes under that of the kings of Scotland. At the time of the Conquest, the county was in such a state of poverty and desolation, that it was not rated in the Domesday Book, William the Conqueror having remitted all its taxes. Walter, one of his countrymen, laid the foundation of a priory at Carlisle, which was afterwards converted into an episcopal see. In 1237 Cumberland was finally annexed to the crown of England by Henry III. at a conference held at York; but the feuds between the two kingdoms continued for more than three centuries afterwards, and this county, situate on the borders, and containing the *debatable land*, was often the scene of contention, rapine, and bloodshed. In 1307 Edward I. died, on an ex-

pedition towards Scotland, at Burgh Marsh, near Carlisle, where a monument has been erected to his memory. The inhabitants of the county at various times suffered many cruelties and deprivations, had several towns burnt and monasteries destroyed, and were not relieved from hostile attacks and inroads until the union of the two crowns by the succession of James I. Even after this time, outrages and robberies were frequently committed. During the civil war between king Charles and his parliament, and also during the time of Cromwell, Carlisle was besieged, and the inhabitants were much harassed and distressed. This county was the scene of hostilities in the rebellions of 1715 and 1745. In the latter, Carlisle was taken possession of by Charles Stuart and his followers, and was retaken by the king's forces under the duke of Cumberland.

There were formerly several monasteries and antient hospitals in Cumberland. The Austin monks had a priory at Lanercost and another at Carlisle. The Benedictines had priories at Wetheral, Nunnery, St. Bees, and Seaton. The Cistercians had an abbey at Holm Cultram and another at Calder. There was a convent of grey friars at Penrith; one of black friars and another of grey friars at Carlisle. There were religious houses of antient foundation at Carlisle, St. Bees, and Dacre. A nunnery is said to have been founded at Carlisle by David, king of Scotland, at which place there was an hospital for thirteen lepers, dedicated to St. Nicholas. At Wigton, an hospital and free chapel were dedicated to St. Leonard. Many of the old churches exhibit remains of the Saxon and early Gothic architecture. Specimens of the former may be seen in the churches of Aspatria, Torpenhow, and Kirklington; and of the latter

in the abbeys of Lanercost and Holm Cultram. The west end of the last-mentioned abbey is the only specimen of the latest Gothic in the county. The churches of Burgh-on-Sands, Newton Arlosh, and Great Salkeld have strongly-fortified towers, which probably served as places of refuge for the inhabitants of these villages in the time of an invasion.

STATISTICS.—Population. Cumberland is both an agricultural and manufacturing county. It is the twenty-eighth on the list of agricultural counties. The population, in 1831, included 40,614 male inhabitants of twenty years of age and upwards. Of this number, 15,466 were engaged in agricultural pursuits, and 3214 in manufactures or in making manufacturing machinery. The latter were thus distributed: the manufacture of cotton employed 2200; calico and ginghams, 300; woollens, 174; sail-cloth, linen, and linen thread, about 100; pottery, 5; and about 250 in the manufacture of cordage, sail-cloth, twine, worsted, and tobacco, most of them at Whitehaven.

The following summary of the population taken at the last census (1831), shows the number of inhabitants and their occupations in each ward, &c. of the county.

WARDS*, &c.	HOUSES.				OCCUPATIONS.			PERSONS.			Males twenty years of age.
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other families not comprised in the two preceding classes.	Males.	Females.	Total of persons.	
Allerdale — above Derwent . . .	7,967	8,261	41	478	2,444	2,360	3,457	18,950	20,968	39,918	9,053
Allerdale — below Derwent . . .	5,031	5,354	24	229	2,040	1,469	1,845	12,837	13,559	26,396	6,368
Cumberland . . .	3,848	4,140	40	184	1,701	1,699	740	10,159	10,445	20,604	5,225
Eskdale . . .	4,161	4,593	22	120	2,223	1,428	942	11,987	12,004	23,991	6,005
Leath . . .	5,094	5,443	24	286	1,973	1,396	2,074	13,830	13,543	27,373	6,937
Carlisle (city) . . .	2,696	4,326	50	116	249	2,886	1,191	9,450	10,556	20,006	4,890
Whitehaven (town) . . .	2,220	2,703	12	99	..	788	1,915	4,758	6,635	11,393	2,136
Totals . . .	31,017	34,820	213	1512	10,630	12,026	12,164	81,971	87,710	169,681	40,614

The population of Cumberland at each of the four enumerations was:—

	Males.	Females.	Total.	Inc. per Cent.
1801 . . .	54,377	62,853	117,230	..
1811 . . .	63,433	70,311	133,744	14
1821 . . .	75,600	80,524	156,124	17
1831 . . .	81,971	87,710	169,681	10

Showing an increase between the first and last periods of 52,451 persons, or nearly 44 $\frac{3}{4}$ per cent., being 12 $\frac{1}{4}$ per cent. below the general rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates of—

1801 were £27,603, which was 4s. 8d.	for each inhabitant.
1811 „ 44,985 „ „ 6s. 8d.	
1821 „ 52,352 „ „ 6s. 8d.	
1831 „ 46,167 „ „ 5s. 5d.	

The sum expended for the same purpose in the year ending 25th March, 1836, was 34,883*l.* 7*s.*; and assuming that the population has increased at the same rate of per-centage since 1831 as in the ten years preceding that period, the above sum gives an average of 3*s.* 11*d.* for each inhabitant. All these averages are below those for the whole of England and Wales.

The sum raised in Cumberland for poor's-rate, county-rate, and other local purposes, in the year ending 25th

March, 1833, was levied upon various descriptions of property, as follows:—

	£.	s.	d.
On land . . .	43,405	14	0
„ dwelling-houses . . .	12,080	6	0
„ mills, factories, &c. . .	1,182	10	0
„ manorial profits, navigation, &c. . .	1,575	14	0
Total money levied by assessment . . .	58,244	4	0

The amount expended was:—

For the relief of the poor . . .	46,901	15	0
In suits of law, removal of paupers, &c. . .	2,197	4	0
For other purposes . . .	9,585	10	0
Total money expended . . .	£58,684	9	0

In the returns made up for the three succeeding years, the descriptions of property assessed for local purposes are not distinguished.

	1834.	1835.	1836.
The total money levied, was	£57,919 13 0	54,396 15 0	46,811 1 0
Expended for relief of poor . . .	43,067 2 0	38,966 8 0	34,883 7 0
„ in suits of law, removal, &c. . .	2,315 13 0	1,857 3 0	1,655 6 0
Payments for or towards county rates . . .		8,651 16 0	5,935 8 0
Expended for all other purposes . . .	11,824 1 0	5,130 6 0	4,507 14 0
Total parochial rates expended	57,276 16 0	54,605 13 0	46,981 15 0

* A new division has been made since the census was taken, which is mentioned in the previous part of this article.

The saving effected in the sums expended for the relief of the poor in 1836, as compared with the expenditure of 1835, is therefore rather less than 10½ per cent. The amount of the other items is however still less in proportion than that of the preceding year, reducing the whole amount of saving to nearly 14 per cent.

From a parliamentary report on the subject, made in 1836, it is found that the number of turnpike trusts in Cumberland is 14; the number of miles of road under their charge is 215; the annual income arising from the tolls and parish composition, in 1834, was 17,365*l.* 15*s.* 2*d.*; and the annual expenditure, 17,655*l.* 11*s.* 11*d.*

The amount of expenditure of county-rate in the year 1834 was 11,161*l.* 15*s.* 8½*d.*—thus disbursed:

	£.	s.	d.
Bridges, building, repairs, &c.	6,437	7	10
Gaols, houses of correction, &c., and maintaining prisoners, &c.	1,552	19	3
Shire halls and courts of justice—building, repairing, &c.	44	9	7
Prosecutions	1,078	13	8
Clerk of the peace	448	11	11
Conveyance of prisoners before trial	123	4	3
“ of transports	132	12	0
Vagrants—apprehending and conveying	147	12	7
Constables—high and special	200	0	0
Coroner	278	8	3
Miscellaneous	717	16	4½

The number of persons charged with criminal offences in the three septennial periods ending with 1820, 1827, and 1834, were respectively 351, 408, and 477; making an annual average of 50 in the first period; of 58 in the second, and of 68 in the third period.

The number of persons tried at quarter-sessions in respect of which any costs were paid out of the county rates in each of the years 1831, 1832, and 1833, were 33, 38, and 50, respectively:

	1831.	1832.	1833.
Total number of felonies so tried	25	33	42
“ misdemeanors	8	5	8

The total number of commitments to the quarter-sessions in each of the same years was 38, 43, and 42, respectively: of whom

	1831.	1832.	1833.
The number convicted was	29	33	34
“ acquitted	5	8	6
Discharged by proclamation	4	2	2

At the assizes and sessions in 1835, 100 persons were charged with crimes in Cumberland; out of which number 17 were charged with offences against the person, 10 of which were common assaults; only 1 was committed for housebreaking; 66 for offences against property committed without violence; and of the remaining 16 one was committed for forgery, 1 for uttering counterfeit coin, 4 for perjury, and 10 for riot, &c. Of those committed 86 were convicted, and 14 acquitted, or no bill found. The 86 who were convicted, were punished as follow:—1 was executed, 2 transported for life, 1 for 14 years, and 15 for 7 years; 4 imprisoned for 2 years or upwards of 1 year, 21 for 1 year, or more than 6 months, and 40 for 6 months or under; 2 were discharged on sureties. Of the offenders 79 were males and 21 females. Among the whole number 50 could read and write, 22 could read only, 24 could neither read nor write; and of the remaining 4 the degree of instruction could not be ascertained. The proportion of the offenders to the population in 1835 was 1 in 1697.

The number of persons qualified to vote for the county members of Cumberland were, in

	1834.	1835.	1836.
The eastern division	3992	4623	4638
The western division	4149	4406	4437
	8141	9029	9075

which is 1 in 14 of the whole population, and 1 in 4 of the male population above 20 years of age. The expenses of the last election to the inhabitants of the county were 361*l.* 2*s.* 2*d.*, and were paid out of the general county rate.

There are six savings-banks in this county. The number of depositors and amount of deposits on the 20th of November were in the respective years:—

	1832.	1833.	1834.	1835.
Number of depositors	3979	4215	4543	4898
Amount of deposits	£125,537	133,827	140,399	149,414

The various sums placed in the savings-banks in 1834 and 1835, were distributed as under:—

	1834.		1835.	
	Depositors.	Deposits.	Depositors.	Deposits.
Not exceeding £20	2307	£19,293	2402	£19,501
“ 50	1403	42,730	1568	47,157
“ 100	553	38,401	641	41,739
“ 150	176	20,763	175	20,614
“ 200	85	14,563	93	15,903
Above 200	19	4,649	19	4,500

Education.—The following particulars are obtained from the parliamentary papers on the subject, delivered after the sessions of 1835:—

	Schools.		Scholars.		Total.
Infant Schools	11				
Number of infants at such schools; ages from 2 to 7 years:—					
Males			377		
Females			486		
Sex not specified			—		
					863
Daily Schools	632				
Number of children at such school, ages from 4 to 14 years:—					
Males			9688		
Females			7149		
Sex not specified			3831		
					20,668
		Schools	643		
Total of children under daily instruction					21,531
Sunday Schools	185				
Number of children at such schools, ages from 4 to 15 years:—					
Males			6100		
Females			5553		
Sex not specified			3039		
					14,692

Assuming that the population between 2 and 15 years increased in the same ratio as the whole of the population between 1821 and 1831, and that it has continued to increase in the same ratio since, we find that there must have been living in Cumberland in 1834 (the time this education inquiry was made) 54,860 persons between those ages. Of these a large number attend both daily and Sunday schools. Only four Sunday schools are returned from places where there are no other schools, and where the children, 258 in number, who are instructed therein, cannot be supposed to attend at any other school; at all other places Sunday-school children have the power of resorting to other schools also; but in what number or in what proportion duplicate entry of the same children is thus produced, must remain uncertain. Twenty schools, containing 1380 children, which are both daily and Sunday schools, are returned from various places, and duplicate entry is therefore known to be thus far created. After making deductions for this, we may conclude that much below two-thirds of the children receive instruction.

Maintenance of Schools.

Description of Schools.	By endowment.		By subscription.		By payments from scholars.		Subscrip. and payment from scholars.	
	Schls.	Scholars.	Schls.	Scholars.	Schls.	Scholars.	Schls.	Scholars.
Infant Schools	—	—	2	115	4	80	5	668
Daily Schools	94	2050	14	1,297	501	15,077	23	2244
Sunday Schools	4	306	171	13,654	1	30	9	702
Total.	98	2356	187	15,066	506	15,187	37	3614

The schools established by dissenters, included in the above statement, are:—

	Schools.	Scholars.
Infant Schools	—	—
Daily “	3	225
Sunday “	44	5197

The schools established since 1818 are:—

Infant and other daily Schools	308	8,910
Sunday Schools	143	10,114

Seven boarding schools are included in the number of daily schools as given above.

No school in this county appears to be confined to the children of the parents of the Established Church, or of any other religious denomination; such exclusion being

disclaimed in almost every instance, especially in schools established by dissenters, with whom are here included Wesleyan Methodists, together with schools for the children of Roman Catholic parents.

Thirty-nine schools in Cumberland have lending-libraries attached to them.

CUMBERLAND, RICHARD, was born in the parish of St. Ann, near Aldersgate, in London, on the 13th of July, 1632. He received the early part of his education at St. Paul's school, and went thence to Magdalen College, Cambridge, in 1649. After taking his master's degree he thought of entering the medical profession, and accordingly studied medicine for a short time; but he soon relinquished this intention, and took orders. In 1658 he was appointed to the rectory of Brampton, in Northamptonshire, where he remained till 1667, when Sir Orlando Bridgman, who had been his contemporary at Cambridge, and had now become lord keeper, first made him his chaplain, and shortly after bestowed on him the living of All-hallows, in Stamford. In both places he performed the duties of minister with the most exemplary assiduity. In Stamford he regularly preached three times every Sunday, having taken upon himself a weekly lectureship in addition to his parochial duties. His 'Inquiry into the Laws of Nature,' which was written while he was chaplain to Sir Orlando Bridgman, appeared in 1672, the year in which Puffendorf published his 'Treatise on the Law of Nature and Nations.' His 'Essay on Jewish Weights and Measures,' a work of great learning and acuteness, was published in 1686.

After the Revolution, Dr. Cumberland was raised to the see of Peterborough, in the room of Dr. Thomas White, who refused the new oath. The manner in which the many bishoprics that thus became vacant were filled up by William is thus described by Bishop Burnet: 'It was visible that in all these nominations, and the filling the inferior dignities that became void by their promotion, no ambition nor court favour had appeared; men were not scrambling for preferment, nor using arts or employing friends to set them forward; on the contrary, men were sought for and brought out of their retirement, and most of them very much against their own inclinations.' (*Hist. of his Own Time*, vol. ii. p. 76.) These remarks are particularly applicable to Dr. Cumberland's case. 'The king was told,' says Mr. Payne, his chaplain, to whom we are indebted for a brief, and that the only, memoir of Cumberland, 'that Dr. Cumberland was the fittest man he could nominate to the bishopric of Peterborough. Thus a private country clergyman, without posting to court,—a place he had rarely seen,—without suing to great men, without taking the least step towards soliciting for it, was pitched upon to fill a great trust, only because he was fittest for it. He walked after his usual manner on a post-day to the coffee-house, and read in the newspaper that one Dr. Cumberland, of Stamford, was named to the bishopric of Peterborough; a greater surprise to himself than to any body else.' (Preface to Sanchoniathon's *History*, p. xii.) This was in the sixtieth year of his age; but his health was still good, and he entered with great zeal on the performance of his new duties. He had commenced, some years before, a critical examination of Sanchoniathon's Phœnician History; and this work still occupied him for some years after he was made a bishop. It led him to several cognate inquiries, the results of which were published some time after his death under the title of 'Origines Antiquissimæ, or Attempts for Discovering the Times of the first Planting of Nations.' Neither was the series of dissertations on Sanchoniathon's History published during his lifetime. They were both edited by Mr. Payne, and published, the latter in 1720, the former in 1724. At the age of eighty-three Dr. Cumberland, having been presented by Dr. Wilkins with a copy of his Coptic Testament, then just published, commenced, like another Cato, the study of Coptic. 'At this age,' says Mr. Payne, 'he mastered the language, and went through great part of this version, and would often give me excellent hints and remarks as he proceeded in reading of it.' He died on the 9th of October, 1718, in the eighty-seventh year of his age.

Dr. Cumberland's private character appears to have been a perfect model of virtue. 'When I read,' says Mr. Payne, 'the character given in Scripture of Moses, that "he was very meek above all the men that were upon the face of the earth," and that given to Nathaniel by our Saviour, that

"he was an Israelite indeed, in whom was no guile;" I cannot but apply them to this extraordinary person, for I think there never could be a man after them whom these characters do more truly fit.' He was a man also of most extensive learning. 'He was thoroughly acquainted with all the branches of philosophy: he had good judgment in physic, knew everything that was curious in anatomy, had an intimacy with the classics. Indeed he was a stranger to no part of learning, but every subject he had occasion to talk of, he was as much a master of it as if the direction of his studies had chiefly lain that way. He was thoroughly conversant in scripture, and had laid up that treasure in his mind. No hard passage ever occurred, either occasionally or in reading, but he could readily give the meaning of it, and the several interpretations, without needing to consult his books.'

The Inquiry into the Laws of Nature* was called forth by the political and moral works of Hobbes. Hobbes is charged therein with atheism; he is represented, as he is also represented in Cudworth's 'Eternal and Immutable Morality,' as denying any standard of moral good and evil other than one fashioned by human law; he is upbraided for the forms of expression that in a state of nature all men have a right to all things, and that the state of nature is a state of war. These differences between Hobbes and Cumberland may be all traced to a misapprehension of the former's meaning. As regards Cumberland's own views of moral science, they are substantially correct. Objections may be made to the phrases, 'law of nature' and 'right reason,' by which last he denotes the set of faculties employed in the determination of moral good and evil. But though in a science where the chief disputes that have arisen are verbal disputes, phraseology cannot be accounted unimportant, and though that phraseology, combined with clumsiness of style and arrangement, has prevented a general perception of the substantial merits of the work, we must, while we regret the defect and its consequences, do justice to a really correct system. Tendency to affect the general good is made the standard of morality. To endeavour to effect the greatest amount of general good, is the one great duty, or the one great 'law of nature;' and we know, according to Cumberland, that it is a duty or law of nature, or law of God, because we know that an individual derives the greatest happiness from the exercise of benevolence, and that God desires the greatest possible happiness of all his creatures. Carrying out the fundamental principle, that the greatest general good is to be sought, he deduces the several particular duties or particular 'laws of nature.' He founds government upon, and tests it by, the same principle.

Sir James Mackintosh, after passing one or two other criticisms on Cumberland's system, observes: 'He had a momentary glimpse of the possibility, that some human actions might be performed with a view to the happiness of others, without any consideration of the pleasure reflected back on ourselves. But it is too faint and transient to be worthy of observation, otherwise than as a new proof how often great truths must flit before the understanding before they can be firmly and finally held in its grasp.' The pretty sentiment of the second sentence is doubtless the secret of a criticism, which, passed upon a system that makes the general good the end, and spoken of the good accruing to one's self from the pursuit of the general good only as an index to the will of God, is, at best, unmeaning. Sir James afterwards says: 'Throughout his whole reasoning, he adheres to the accustomed confusion of the quality which renders actions virtuous with the sentiments excited in us by the contemplation of them.' 'The quality which renders actions virtuous' is, according to Cumberland, their tendency to increase the general good. 'The sentiments excited in us by the contemplation of them' are, the sentiments of moral approbation and disapprobation. Does Cumberland confound these sentiments with a tendency to increase general good? Can this, which Sir James Mackintosh calls an 'accustomed confusion,' ever have taken place? (*Dissertation on Ethical Philosophy*, sec. v.)

The 'Inquiry,' as may be inferred from the Latin title which has been given, was written in Latin. It was printed in a most inaccurate way, and the innumerable errors of

* The following is the title in full of the work:—'De Legibus Naturæ Disquisitio Philosophica, in qua earum forma, summa capita, ordo, promulgatio, et obligatio, e rerum natura investigantur; quin etiam Elementa Philosophiæ Hobbianæ, cum moralis tum civilis, considerantur et refutantur.'

the original edition have been perpetuated in the several German and London reprints. Dr. Cumberland left an interleaved copy with a few corrections and additions; in this same copy the whole text was revised by Dr. Bentley; and thus enriched, the copy was presented to the library of Trinity College, Cambridge, by Richard Cumberland, the great-grandson of the bishop, and grandson of Dr. Bentley. An abridged translation was published by Mr. James Tyrrel in 1701, during Dr. Cumberland's lifetime. Mr. Maxwell, an Irish clergyman, published a translation in 1727, prefixing and appending some original dissertations. M. Barbeyrac published a translation into French in 1744, having been allowed the use of the interleaved copy containing the author's and Dr. Bentley's corrections. A third English translation by the Rev. John Towers, D.D., appeared in 1750. (Payne's Preface to Cumberland's *Sanchoniathon's History*; Kippis's *Biographia Britannica*.)

CUMBERLAND, RICHARD, a favourite dramatic writer and miscellaneous author of the last century, great-grandson of Richard Cumberland, bishop of Peterborough, and grandson by the mother's side of Dr. Richard Bentley, was born February 19, 1732,* in the lodge of Trinity College, Cambridge. He was placed successively at the public schools of Bury St. Edmund's and Westminster; and at the early age of fourteen commenced his residence at Trinity College, Cambridge. Though during his two first years he had entirely neglected his mathematical studies, he distinguished himself highly by readiness and skill as a disputer in the schools, and obtained the degree of tenth wrangler. Two years after, he was elected fellow of Trinity. It was his intention to enter the church, and devote himself to literature and the duties of his profession. From these views he was withdrawn by being appointed, in the same year, private secretary to the earl of Halifax, then first lord of trade, whom he accompanied, on his appointment to be lord lieutenant, to Ireland in 1760. Through this connection his father became bishop, first of Clonfert, afterwards of Kilmore. To Cumberland himself the connection brought little benefit. But after passing through one or two subordinate offices, he was appointed secretary to the Board of Trade, soon after Lord George Germaine became first lord in 1775, and held that office until the suppression of the board in 1782. In 1780 he was sent on a confidential and secret mission to the court of Madrid. This seemingly fortunate appointment proved the source of no small loss and vexation, in consequence of his necessary expenditure to the extent of 4500*l.* beyond the money which he received at starting, of which no portion ever was repaid. On this subject we have only his own *ex parte*, but uncontradicted, statement: there is every appearance that he was exceedingly ill used.

After the reduction of the Board of Trade he received a compensation allowance, and retired to husband his diminished means at Tunbridge Wells. He now devoted himself altogether to literature, which had hitherto been only his amusement; and tried his powers in the multifarious departments of opera, farce, comedy, tragedy, occasional, lyric, and sacred poetry, pamphlets, novels, essays, and even divinity: but he will hardly be remembered except as an essayist, and as the author of several successful comedies, of which only the *West Indian*, the *Wheel of Fortune*, and the *Jew* need be mentioned. The *West Indian* obtained great popularity on its first appearance, and is still a stock piece: it was in Major O'Flaherty, one of the chief characters, that the eminent comedian Moody made his first favourable impression on the public. The *Jew* was an honourable attempt to combat popular prejudice against the Jewish nation. The *Wheel of Fortune* is identified with John Kemble, who made Penrodock one of his very effective characters. Many other of his dramatic pieces, of which there are at least thirty-two, were popular at the time of their production; and even those which had little sterling merit added for a time to his reputation, by keeping his name continually before the public: but to the best of our recollection there were no others which now require notice.

As an essayist, he rode to fame on the shoulders of Bentley, from whose manuscripts he derived the learning of those series of papers in the '*Observer*,' on Greek poetry, which contain a rich collection of translated fragments of the comic poets. The merits of the translations, however,

* In the last edition of the '*Encyclopedia Britannica*' this date is erroneously given February 29, 1722.

belong to Cumberland. There are also a number of valuable critical essays, chiefly on the drama. The entire work proceeded from Cumberland's pen, and affords honourable evidence of the author's fertility of imagination, knowledge, humour, and varied power of composition. His translation of the '*Clouds of Aristophanes*' is elegant, but he has altogether missed the spirit of the original.

One of Cumberland's pamphlets that appeared without his name, entitled '*Curtius rescued from the Gulph, or the Reply Courteous to the Rev. Dr. Parr, in answer to his learned pamphlet, entitled "A Sequel," &c.*', is no unfavourable specimen of the author's powers of humour and sarcasm, and his readiness at paying off a mass of learned quotations in coin of the same but a more current kind.

His memoirs, published in 1806, is a very amusing book, full of interesting anecdotes of the men of his time, which will give the reader a thorough insight into the vain and irritable character of the author. His reputation was unblemished in the discharge both of his public and private duties; and his society was much courted for his brilliant conversation. He is recorded to have had one weakness quite at variance with the pride of character to which he lays claim, a habit of flattery which was succeeded by bitter sarcasm as soon as the objects of it had turned their backs. For such a practice it is a poor excuse to say that we suppose it to have originated not in malevolence, but in the straits to which a talker by profession may be continually put to maintain his reputation.

Mr. Cumberland died, after a few days' illness, May 7, 1811.

CUMBRIAN MOUNTAINS. These form a group in the north-western part of England, occupying rather more than a third of Cumberland, perhaps one-fifth of Westmoreland, and a small part of North Lancashire. The road leading from Kendal to Carlisle through Shap, may be considered as its eastern boundary; but the Shap Fells are united by high land to the Pennine Mountains, which extend farther east between Westmoreland and Yorkshire, and likewise north and south from their junction with the Cumbrian range. The highest part of that road is 1187 feet above the sea. From this line the mountains extend westwards, and terminate with Dent Hill, a few miles from Whitehaven. The most northern point of the mass is Fell Top, near Hesketh-new-market in Cumberland, and the most southern the slate quarries near Ulverston in Lancashire. From north to south the group measures about 37 miles, from east to west about 35 miles. The whole system probably covers a surface little short of 700 square miles.

This group consists properly of one immense mass of rock, furrowed by narrow and deep valleys, the direction of which is towards all the points of the compass. By these valleys a large number of ridges is formed. That part which is connected with the Pennine range by the Shap Fells may be considered as the line of its axis, which in its western direction passes through Helvellyn (3055 feet), embraces Red Pike and Pillar (2893 feet), and terminates with Dent Hill (1110 feet). The high cape of St. Bees Head (222 feet), which lies in the prolongation of this line, is separated from Dent Hill by low ground.

Several high peaks occur to the north of this line. One extensive mass of rocks, lying to the east of Bassenthwaite Water, is overtopped by the three high summits of Saddleback (2787 feet), Skiddaw (3022 feet), and High Pike near Hesketh-new-market (2101 feet). To the south-west of Bassenthwaite Water is Grasmere Fell (2756 feet). On the south of the axis, the highest summits are due south of Pillar. In this part are Scaw Fell (3092 feet), and Bow Fell, near Eskdale (2914 feet). East of them, Conistone Fell (2577 feet) is more isolated. Black Comb (1919 feet) is much farther south, near Duddon mouth, on the west side of that estuary.

According to the recent observations of Professor Sedgwick, the greatest part of this cluster of mountains is formed by stratified deposits of slaty texture. More than the northern half consists of green quartzose roofing slate, and the southern portion of grauwaacke slate. The line separating both formations runs from the northern extremity of Winandermere Lake to Shap Fells on the east, and nearly in a straight line. On the west it continues at some distance from the northern extremity of Conistone Water, and then runs southward to Broughton on Duddon mouth. A narrow band of limestone and calcareous slate separates the

two formations. Black Comb consists of old black slate. Granite is found between Black Comb and Wast Water, on the north side of Ennerdale Water, in Skiddaw, and between the northern part of Ullswater and Penrith. A broad band of coal encircles on the north the mountain limestone, and runs from Whitehaven by Workington, Maryport, a little south of Wigton and a little north of Hesketh-new-market, to nearly as far as Penrith.

This group of mountains is well known for its picturesque scenery. The mountains rise with steep acclivities, especially those west of Helvellyn, inclosing narrow but in some parts well-cultivated valleys, which derive a great part of their beauty from the numerous lakes which occupy the widest part of them. To the north of the central range, proceeding from east to west, are Hawes Water (714 feet), Ullswater (460 feet), Thirlmere (473 feet), Derwent Water (222 feet), Bassenthwaite Water (210 feet), and Crummock (260 feet above the sea). To the south of the axis, proceeding from west to east, are Ennerdale Lake, Wast Water (160 feet), Coniston Water (105 feet), Grassmere (196 feet), and Winandermere (116 feet above the sea). The whole mountain mass declines more rapidly to the north than to the south, as the different elevation of the lakes evidently shows. For particulars on the lakes and valleys, see BORROWDALE, CUMBERLAND, WESTMORELAND, and LANCASHIRE. (*Geography of Great Britain and Ireland*, by the Society for the Diffusion of Useful Knowledge; Sedgwick in *Geol. Trans.*, Sec. Series, vol. iv., first part, 1835.)

CUMINGIA. [CONCHACEA, vol. vii. p. 430.]

CUMINUM CYMINUM, or CUMIN, is an umbelliferous plant of annual duration, found wild in Egypt and Syria, and cultivated from time immemorial for the sake of its agreeable aromatic fruit, which, like that of Caraway, Dill, Anise, &c., possesses well-marked stimulating and carminative properties. Cumin grows about a foot high, and is very little branched; it is smooth near the ground, but slightly downy near the end of its branches. Its leaves are deeply cut into long capillary segments. The partial and general involucre consist of similar leaves, but smaller. The flowers are white or reddish: the fruit is contracted at the side, surmounted by a calyx with long bristle-pointed divisions, and has each of its halves marked by nine unequal elevated ridges, all of which are slightly muricated, especially the secondary ones, under each of which there is a vitta. Two vittæ are present on the commissure, and the albumen is not involute.

Cumin is said to be employed in flavouring Dutch cheese.

[Cuminum Cyminum.]

1, a young fruit, with the calyx still adhering; 2, a ripe fruit; 3, a transverse section of the latter, showing the ridges, the vittæ, and the commissure.

CUNE'O. [CONI.]

CUNITZ, MARIA, born at Schweidnitz, in Silesia, about the beginning of the seventeenth century. She was remarkable, according to report, for the great variety of her knowledge, but the only published specimen is her 'Urania Propitia, sive Tabulæ Astronomicæ,' &c., printed at Oels in 1650, and at Frankfort in 1651. This work was

composed in a Polish convent, the civil troubles having driven the authoress from her country. It is an attempt to simplify the methods derived from Kepler's laws, and in particular to avoid the use of logarithms; more remarkable from the circumstance of the writer being a female than from any particular merit.

The principal instructor of Maria Cunitz in astronomy was a countryman of her own, named Loewen, whom she married on the death of her father. The preface and dedication of the tables were written by him. She died at Pitschen, in Silesia, probably after 1669. (Delambre, *Astron. Moderne*; Lalande, *Bibliog. Astron.* The latter cites Desvignoles, *Bibl. Germ.*, vol. iii., and Scheibel, *Bibl. Astron.*, p. 361—378.)

CUNNINGHAMIA SINENSIS, an evergreen Chinese tree, formerly called *Pinus lanceolata*. It has narrow oval lanceolate stiff pungent leaves, which, when the plant is old enough, collect into cones, after the manner of an *Araucaria*. The plant will live near London, in the open air, with a little protection in winter.

CUNONIA'CEÆ, a small natural order of polypetalous apocarpous Exogens, allied to Saxifragaceæ, with which they were formerly united. They are trees or shrubs, inhabiting Southern Africa, South America, and very sparingly the East Indies. In most respects their flowers are constructed like those of Saxifragaceæ, but the styles are more consolidated, and they have a dense spiked or racemose inflorescence instead of a few loosely-arranged blossoms. The leaves are opposite, and furnished with interpetiolar stipules; and being pinnated in most cases, give the plants a peculiar aspect. Little is known of their properties, except that their bark is sometimes very astringent and used for tanning purposes.

[Cunoniaceæ Weinmannia Jubescens.]

1, a perfect flower; 2, an ovary; 3, a transverse section of the same; 4, a ripe fruit.

CUPAR FIFE (so named in contradistinction from the small towns of Cupar Angus and Cupar Grange in Perthshire), is the county town of Fife, and has separate jurisdiction as a royal burgh, in which capacity it formerly enjoyed many municipal privileges, being called by Camden 'Burgus Insignis.' At present it is the most important place in the county, not only as the seat of the county courts for the administration of justice, by which it

is made the residence of numerous legal practitioners, but on account of its manufactures, corn-market, and numerous fairs for agricultural produce. It is situated nearly in the middle of the peninsula of Fife, at the confluence of the small streams Eden and Lady Burn, or St. Mary, and about 10 miles west of St. Andrews; having, on the south, a range of high hills, and on the north a fertile country, diversified with hills and numerous woods. The site of the town is only 25 feet above the level of the sea, from which it is distant 6 miles; the temperature of the air is mild, and is said to be very favourable to longevity. It is a place of great antiquity. In the parliamentary rolls of David II. are the names of commissioners from 'the royal burgh of Cupar,' and on a mound, called the Castle Hill, there formerly stood a castellated fortress which was the head-quarters of the chiefs of the family of Macduff, the feudal earls or thanes of Fife. At the foot of the Castle Hill was a convent of Dominican monks, or Black Friars. Of these establishments no vestiges now exist; but in opening the surface of their sites several skeletons and other relics have been discovered. A green esplanade before the castle, still called the Play Field, was antiently used for the performance of the religious shows called *mysteries* and *moralities*: and here, in 1555, was acted the famous David Lindsay's witty drama of the 'Three Estates,' a popular satire on the priesthood, which greatly promoted the subsequent religious revolution.

Cupar consists principally of one long street, extending from west to east, but several others contain new and handsome houses. The public buildings are neat and convenient, with the exception of the gaol, which, with an exterior resembling a gentleman's mansion, affords very bad accommodation for the prisoners. Besides the parish church, which is plain and commodious, there are various dissenting meeting-houses and an episcopalian chapel. The number of ale-houses, not including shops for the sale of spirits, is 53. The town has a cleanly and very respectable appearance, the vicinity being ornamented with some neat villas and gardens. Spring and well water is abundant. The streets are lighted with gas, and are partially paved, a luxury seldom found in the country towns of Scotland. The number of resident procurators who practise in the county courts is about 30; making, with their clerks, a total of about 90 inhabitants who subsist by the legal profession. There are two reading-rooms, and a subscription library consisting of 4000 volumes. The schools of Cupar are in high repute. In addition to a large grammar-school on the Castle Hill, several others are established on Dr. Bell's system, so that no child in the town at the age of five is unable to read. There are two printing-presses, one of which is famed for the beautiful and accurate impression of Dr. Hunter's editions of several of the Latin Classics. The chief manufacture is linen. Three spinning-mills for flax employ about 240 hands. The water of the Eden is made available for the movement of machinery of 80 horse-power, and about 900 weavers of linen are constantly engaged in their own dwelling-houses. A snuff-mill, worked both by water and steam, manufactures annually 60,000 lbs. of Scotch snuff. There are two tan-yards, and breweries; and from an immense bed of clay in the vicinity a great quantity of bricks and coarse earthenware is made. Building materials are supplied from four quarries of white sandstone. Many of the inhabitants of the parish are employed in agriculture, which is carried on very successfully, all the adjacent land being arable, and producing the finest crops of wheat and turnips. Excellent races are held under the patronage of the Fife Hunt, and a subscription pack of fox-hounds is kept.

The town of Cupar, jointly with St. Andrews and Crail, the two Anstruthers, Kilkenny, and Pittenween, sends one member to parliament. The population, in 1831, of the burgh and parish was 6473. (*New statistical account of Scotland*; *Carlisle's Topog. Dict. of Scotland*; *Chambers's Gazetteer of Scotland*.)

CUPEL, CUPELLATION. [ASSAYING.]

CUPID (Cupido, *desire*), in Latin mythology, the god of love. Cicero (*Nat. Deor.*, iii. 23) enumerates three deities, or rather three forms of the same deity, bearing this name, each the son of a different Venus, by a different father. Of these the principal, and the one who is usually meant when the name of Cupid occurs without qualification, is the son of Mercury and Venus daughter of Dione. He is represented by the poets as a child armed with bow and arrows,

as an emblem of the inspiration of love, through the eye, from a distant object. Hence the metaphorical expressions of 'darts of love,' 'eyes darting desire,' and the like. Often he is represented as blind, in reference to the ill-assorted connections, the unrequited affection, or the neglect of reason and duty, of which a hasty passion is often the cause. By artists he is variously designed; sometimes riding on a lion, or breaking Jupiter's thunderbolts, to signify that the strongest yield to the influence of love: often with a butterfly, in allusion to his amour with Psyche. [PSYCHE.] Athenæus (xiii. 2) quotes a beautiful passage from the Phædrus of Alexis, to show the impossibility of representing Cupid to the senses.

CU'POLA. [DOME.]

CUPPING is of two kinds; one by which some blood is taken away, generally simply termed cupping; the other when no blood is abstracted, which is accordingly termed dry cupping. The preliminary steps of the operation are the same in both cases: the part to which it is intended to apply the cupping-glasses is washed with warm water, or a warm cloth is merely applied to it, in order to attract blood to the part. A small bell-shaped glass, a portion of the air of which has been expelled by holding it for an instant over the flame of a spirit-lamp, is immediately applied to the spot which has been prepared. The usual amount of pressure on the part being diminished, the blood flows to the part, and produces distension of the vessels and elevation of the surface, as well as a purple or livid colour. If it be intended to take away blood, the cupping-glass is speedily removed, and an instrument called a scarificator, containing a number of lancets, sometimes as many as twenty, is applied, and made to act so as to inflict a corresponding number of incisions on the skin and subjacent vessels. 'The instrument is so constructed, that the depth to which the lancets penetrate may be made greater or less at the option of the practitioner.' It is not in general advisable that the depth should be very great, as more blood flows, and the vessels will continue to bleed longer, if only partially divided, than if completely cut through. The cupping-glass, exhausted as before, is to be immediately replaced, and if skilfully applied, and the air has not been too much rarified, by which too great pressure is made by the edges of the glass, a considerable quantity of blood will flow into it. When nearly full, or if the blood begin to coagulate, the glass is to be carefully removed, the wounded part quickly washed with a sponge with warm water, and the glass having been emptied and washed, is to be again applied, if a sufficient quantity of blood should not have been obtained by the first application. Two or more glasses may be applied to different spots at the same time, so that the quantity of blood desired, or necessary to obtain the object in view, may be more quickly abstracted.

'Where dry cupping only is intended, the glasses may be permitted to remain on the skin for a few moments, and replaced five or six times with a little variation of their position, in order to prevent the skin from being hurt by their pressure.'

Cupping by which blood is abstracted is used either where general bleeding is unnecessary, or as supplementary to it, for the removal of congestions or local affections. It is analogous to the use of leeches, over which, however, when the situation of the part admits of the application of the glasses, it has in general many advantages. The blood is more rapidly abstracted, a point of great importance in inflammatory diseases; the quantity removed can be more exactly ascertained; there is less risk of subsequent bleeding from the wounds; and the part of the body subjected to the operation is exposed to the air for a much shorter time. Cupping is also preferable in cases where the application of leeches is followed by severe erysipelas of the skin.

'In all inflammations and congestions about the head, cupping on the back of the neck and between the shoulders is a most useful mode of abstracting blood; and this operation is also particularly applicable for the removal of blood from the parietes of the chest and abdomen in diseases of the different viscera. Its use however is only admissible when it can be employed without exciting pain, and irritating the diseased organ.' Many cases of impending apoplexy may be warded off by the timely application of cupping-glasses to the neck, aided by a quickly-acting cathartic. Where the abstraction of blood is inexpedient or unnecessary, dry-cupping is often resorted to with benefit. In adynamic states of fever, especially where the lungs are

complicated in the diseased action, if 'farther depletion cannot be ventured upon, dry-cupping on the back or chest will sometimes be serviceable.' (Copland's *Dictionary of Medicine*, p. 930.) Dry-cupping often affords great and immediate relief in many pains of the side, not inflammatory, but hysterical, which occur in females. The pains of the back which likewise occur in females at particular times may be much mitigated by dry-cupping.

Another and most important application of cupping is the prevention by its means of the absorption of poisonous fluids from wounds. For this purpose anything by which a partial vacuum over the wounded part can be produced will answer, such as a wine-glass, tumbler, or tea-cup with a smooth margin, from which the air has been partially expelled by holding it for a moment over a lighted candle. This mode was in use among the antients, has been revived among the moderns, and is practised by the South Americans in cases of the bites of venomous serpents, by means of a funnel-shaped calabash. The Greeks called a cupping instrument *σικὴ* (*síkua*), from its bearing some resemblance to the form of a melon or gourd. (Empson's *Narratives of South America*, p. 66; Wardrop on *Blood Letting*; Cooper's *Surgical Dictionary*.)

CUPRESSUS, a coniferous genus, distinguished from the firs and pines by its leaves being mere scales, its cones formed of a small number of peltate woody bracts, and the seeds very small, angular, and several to each bract. Botanists mention several species, but of these three only are suited to the climate of Great Britain.

C. sempervirens, the common upright cypress, is a native of the warmer parts of Europe, but has long since been transferred to gardens for the sake of its deep evergreen branches and leaves, and the gloomy air it imparts to the situations which it occupies. Its timber is of great durability: it is probable that gopher-wood, which some have referred to the cypress, was rather the timber of *Thuja articulata*. It is not much cultivated in England, the climate being too damp and cold for it in summer; otherwise it is sufficiently capable of resisting the cold of winter. Its formal mode of growth moreover is not to the taste of the people of this country.

C. horizontalis, the spreading cypress, is a far handsomer species, partaking in all the excellent qualities of the last, being more hardy, and becoming a beautiful object with its graceful spreading branches, loaded, as they usually are, with large round cones. Miller has rightly pointed out the difference between this and the last, but it is nevertheless exceedingly uncommon in the collections of this country. The spreading cypress of the nurseries is nothing but a very slight variety of *C. sempervirens*.

C. lusitanica, the cedar of Goa, differs from the two preceding in its much freer mode of growth, and in its leaves having a singularly glaucous colour. It is said to be of Indian origin, but has long since been naturalized in Portugal, where, about Cintra, it acquires a large size. In England it will only succeed well in the warm parts of the southern coast.

CUPRESSUS DI'STICHA. [TAXODIUM.]

CUPRESSUS THUIOIDES. [THUJA.]

CUPULE, a kind of cup or involucre surrounding certain kinds of fruit, and composed of bracts more or less grown together. In the oak the cup of the acorn is the cupule; in the hazel-nut it is the husk; in the beech and chestnut the prickly shell; and in the hornbeam the lobed bract.

CUPULIFERÆ. [CORYLACEÆ.]

CURACOA or **CURAZAO**, an island in the Caribbean sea, near the coast of Venezuela, in 12° 6' N. lat., and 69° 3' W. long. Its length from north-west to south-east is 35 miles, and its greatest breadth 6 miles. The island is generally low on the eastern side, but there is a high hill on the north-east, and another still higher on the south-east. There are also some high hills on the west side, which are seen from a considerable distance at sea. The island is wholly dependent upon rain for water, and the soil so wanting in fertility that the inhabitants are partly supplied with provisions imported from other places. It yields a small quantity of tobacco, and affords a large supply of salt. The shores are so bold that vessels of considerable size may sail round the island within a cable's length. There are several harbours; the principal one, Santa Anna, is on the south-west side of the island. The entrance is very narrow; on the eastern side is Fort Amsterdam, and

on the opposite side of the harbour is the town of Caracœa, said to be one of the handsomest in the West Indies.

Curacœa was settled by the Spaniards early in the sixteenth century; it was taken in 1632 by the Dutch, and was captured by the English in 1798, but restored at the peace of Amiens. It was again taken by the English in 1806, and finally given up to Holland at the general peace in 1814.

CURACY and **CURATE.** [CLERGY.]

CURATOR (from *curare*, *i. e.* to care or take care), one who is appointed to take care of anything: in this general sense there were many kinds of curators.

In the civil law the word denotes one who is appointed to administer the estate of any person who is not legally competent to manage his property. 1. There was the curatorship, *i. e.* guardianship, of minors (*cura minorum*). Every person who was *sui juris*, *i. e.* not subject to paternal or domestic dominion, but who was still under age, was put under the superintendence of a guardian. But the Roman law distinguishes two kinds of guardianship; viz. tutelage (*tutela*) and curatorship (*curatela*). (Ayliffe's *New Pandect*, book ii., tit. xxxix.) The former kind of guardianship was in use if the minor was impubes, *i. e.* if a male minor was not fourteen and a female not twelve years old. The guardian in this case was called tutor, and the minor, pupillus. After the tutelage was ended, the minor received a curator till he was twenty-five years of age. This distinction had some important consequences in the civil law, which have only recently fallen into disuse even in countries where the Roman law is still in force. According to the strictness of law, the curatorship terminated with the twenty-fifth year of the minor; but it could also be determined by a solemn declaration of the emperor that the minor should be of age. (C. 2, tit. 45, de iis qui veniam ætatis.) This was called receiving *veniam ætatis*, and it could take place in the case of males in their twentieth, and females in their eighteenth year. 2. As spendthrifts and deaf and dumb persons could not legally administer their estates, they also were put under the superintendence of a curator. 3. A third kind of curators was the curator bonorum, *i. e.* a trustee for the administration of the estate of absent or deceased persons and insolvent debtors. Between this curatorship and that of a minor there was this important difference; the latter was regarded as a public office, which could not be refused, except for such reasons as the law allowed.

(Heineccius, *Jus. Civ. secundum ordinem Pandectarum*, pars iv., § 288, 398, 400-403; vi. 275.)

Curators in antient Rome were also public officers of various kinds, particularly after the time of Augustus, who established several officers with this title. (Suet., *Vit. Aug.*, cap. 37.) 1. *Curatores viarum*, *i. e.* curators who superintended the laying out and repairing of the public roads. This office existed under the Republic, but it was only held as an extraordinary office, and was conferred only for special purposes. 2. *Curatores operum publicorum*, *aquarum*, *cloacarum*, who had the superintendence of the public buildings, theatres, bridges, aqueducts, and cloacæ. 3. *Curatores alvei Tiberis*, who were the conservators of the Tiber. 4. *Curatores frumenti populo dividundi*, whose duty was to distribute corn among the people. Under the emperors we find other officers with the name of *curatores*; as, for instance, the *curatores ludorum*, who had the superintendence of the public amusements: and *curatores rei publicæ*, also called *logistæ*, whose duty it was to administer the landed property of municipia.

CURCUMA LONGA, the Turmeric plant, is an herbaceous fleshy-rooted plant, found wild in various places in the East Indies, where also it is extensively cultivated. It belongs to the natural order Zingiberacæ, in the general aromatic qualities of which it slightly participates. The root is divided into several fleshy fingers, of an oblong form, and as thick as the thumb. The leaves spring at once from the crown of the root, have a lanceolate figure, sheathe each other at the base, are about a foot long, and produce from their centre a short thick leafy spike, in the axil of whose bracts are seated the inconspicuous pale cream-coloured flowers. Dr. Roxburgh gives the following account of the manner in which the plant is cultivated: 'the ground must be rich, friable, and so high as not to be drowned in the rainy seasons, such as the Bengalees about Calcutta call Danga. It is often planted on land where sugar-cane grew the preceding year, and is deemed a meliorating crop. The soil must be well ploughed and cleared of weeds, &c.

It is then raised in April and May, according as the rains begin to fall, into ridges, nine or ten inches high, and eighteen or twenty broad, with intervening trenches, nine or ten inches broad. The cuttings or sets, viz. small portions of the fresh root, are planted on the tops of the ridges, at about eighteen inches or two feet asunder. One acre requires about from nine hundred such sets, and yields in December and January about two thousand pounds weight of the fresh root.'

CURDISTAN. [KURDISTAN.]

CURFEW. The custom of covering up their fires about sun-set in summer, and about eight or nine at night in winter, at the ringing of a bell called the *couvre feu*, or curfew bell, is supposed to have been introduced by William I., and to have been imposed upon the English as a badge of servitude. Henry, in his *History of Britain*, 4to. edit., vol. iii., p. 567, however, says this opinion does not seem well founded, for there is sufficient evidence that the same custom prevailed in France, Spain, Italy, Scotland, and probably in all the other countries of Europe, in this period; and was intended as a precaution against fires, which were then very frequent and very destructive, when so many houses were built of wood. Henry I. restored the use of lamps and candles at court in the night after the ringing of the curfew bell, which had been prohibited by his predecessors. (Will. Malmesb., fol. 88.)

Thomson, in his *Seasons*, countenances the opinion of the tyranny of this custom:—

'The shivering wretches, at the curfew sound,
Dejected sunk into their sordid beds,
And through the mournful gloom of antient times
Mused sad, or dreamt of better.'

But we find the curfew mentioned to a very late period as a common and approved regulation. Among the charges directed for the wardmote inquests in London, in the mayoralty of Sir Henry Colet, A.D. 1495, it is said, 'Also yf there be anye paryshe clerke that ryngeth curfewe after the curfewe be ronge at Bowe Chyrche, or St. Bryde's Church, or St. Gyles-without-Cripelgate, all suche to be presented.' (Knight's *Life of Dean Colet*, p. 6.) The same charge remained in the wardmote inquest, as printed in 1649. Hutehins, in his *History of Dorsetshire*, vol. ii., p. 267, speaking of Mapouder church, in that county, mentions land given 'to find a man to ring the morning and curfew bell throughout the year.' In the same volume, p. 422, under Ibberton, is mentioned an acre given for ringing the eight o'clock bell, and 4*l.* for ringing the morning bell. Bishop Hall, in his *Virgidemiarum*, printed in 1599 (b. iii. sat. 4), speaks of the gift of a new rope to ring the curfew bell as of occasional occurrence in his time.

'Whoever gives a paire of velvet shoes
To the Holy Rood, or liberally allowes
But a new rope to ring the curfew bell,
But he desires that his great deed may dwell,
Or graven in the chancel-window glasse,
Or in the lasting tombe of plated brass.'

The curfew bell, strictly as such, had probably fallen into disuse previous to the time of Shakspeare, who in *Romeo and Juliet* applies the term to the morning bell:

'The second cock hath crow'd,
The curfew bell has rung, 'tis three o'clock.'

In the *Antiquarian Repertory*, old edit., vol. i. p. 89, is an engraving of an iron implement which is called a curfew, or cover-fire, formerly belonging to Gostling, the historian of Canterbury, and presumed to be of very antient if not of Norman origin, but which in reality is no more than an *ex tempore* oven, lately if not still used in many parts of England for baking small viands: the hearth is first heated, the viand placed upon it, and then covered with this implement, the embers being raked round and above it. Either Gostling's, or a cover-fire like it, is still shown among the curiosities of the late Lord Orford's villa at Strawberry Hill.

Milner, in his *History of Winchester*, vol. i. p. 189, says the curfew was first enforced in Winchester, and thence extended to other places: but there is no authority whatever for this surmise, beyond the circumstance that William the Conqueror made Winchester one of the chief places of his residence.

CURIA. [COMITIA.]

CURISCHE HAFF, a kind of bay on the north-eastern shores of East Prussia, supposed to have originated from the throwing up of the sand and the retiring of the waters of the Baltic. From Labiau, in the south, to its opening

into the Baltic at Memel, it is about 60 miles in length; at its greatest breadth, between Cranzkukren and Juwendt, nearly 28 miles: it contains altogether 588 square miles. Its confluence with the Baltic is formed by what is called the 'Memel Deep,' which are from 800 to 1200 feet in width. It cannot properly be called a part of the sea, inasmuch as its waters are fresh, like those of the other Haffs in this quarter. It is separated from the Baltic by a very narrow neck of land, called the 'Curische Nehrung,' formed by a series of low sand banks, almost destitute of vegetation, about one to two miles in breadth—except where they taper to a point as they approach Memel—and about 70 miles in length. On this neck of land there are a few villages. The bed of the Haff is unequal and variable, and the navigation is therefore very precarious; hence the only description of vessels used here is a peculiar kind of large flat boats, and even these are unable to land along many parts of the coast. In stormy weather the navigation is very dangerous. The Dange, the Minge, and the Memel, discharge their waters into this Haff.

CURL. [POTATOES.]

CURLEW. [SCOLOPACIDÆ.]

CURNOUL, a principality formerly governed by an independent chief, and now forming one of the subdivisions of the Balaghaut ceded districts. Previous to its passing into possession of the English, the country had been subdivided into a great number of petty jaghires, and the government of the principality was so badly administered, that a great part of the lands were allowed to revert to a state of nature, and were overgrown with rank weeds and jungle. From this cause the revenue, which had amounted to twenty lacs of rupees (200,000*l.*), was reduced to one-half that sum. The family of the present nabob of Curnoul has held possession of the country by a tenure amounting almost to independence since 1651, when Curnoul was conferred as a jaghire on Khizzer Khan, by Aurengzebe, the governor of the Deccan. On the death of the nabob, Azif Khan, in 1815, the chief authority was usurped by Muzuffer Khan, his youngest son; but the lawful heir, Munawer Khan, speedily obtained his right through the intervention of the governor of Madras, who sent a detachment of troops to the capital for that purpose. [BALAGHAUT.]

CURNOUL, the capital, is a populous town, on the south side of the Toombuddra, in 15° 44' north lat. and 78° 2' east long. It is surrounded on all sides by the rivers Toombuddra and Henday, which are there from 700 to 800 yards wide. Some strong works have been erected on the western side of the town; but in 1815 the place held out against the assaults of the English, only one day after which it was surrendered at discretion. The buildings in the town are partly of stone and partly of mud. Travelling distance from Madras, 279 miles, and from Hyderabad 127 miles.

(Rennell's *Memoir of a Map of Hindustan*; *Report of Committee of the House of Commons*, 1832.)

CURRENT, a well-known hardy fruit produced by two species of the genus *Ribes*. The one *R. rubrum*, is remarkable for the mixture of sweet and acid in its fruit, and for the beauty of its semitransparent red or yellow berries. Of this the finest varieties are Wilmot's red and the white Dutch, and the sweetest Knight's sweet red and the common white. In the fruit of *R. nigrum*, the black currant, a powerful and agreeable aromatic principle takes the place of acidity; of this species the best variety is the Black Naples.

The currants of the grocers' shops are the dried berries of a small kind of grape, chiefly cultivated in the Morea and the Ionian Islands, Corfu, Zante, &c.

CURRENCY. It is the object of this article briefly to state some general facts relating to our currency, reserving for a more advanced stage of this work an examination of the conflicting theories that prevail on the subject of our monetary system.
